A letter from Prof. Weber containing a similar remark on my article is published with my reply to it in the *Indian Antiquary* for February last. I have there considered his argument for bringing Patanjali down to 25 A.D. contained in his review of Dr. Goldstücker's Pāṇini referred to above. All the so-called "important details" of the argument are based on the supposition that the word *Mādhyamika* occurring in one of the two instances pointed out by Dr. Goldstücker denotes the Buddhist sect of that name. This supposition, improbable in itself, necessitates a string of other suppositions still more improbable. Some of them are these: that the dynasty known to Hindu writers by the name of *Turushka* was known to Patanjali by the name of *Yavana*, though there is the clearest evidence to show that the latter name was applied to the Greeks during the two or three centuries immediately preceding the Christian era; that Kanishka, himself a Buddhist, persecuted Buddhists and pushed his conquests up to Sāketa or Oude; and that all the events concerning the Mahābhāṣya recorded in the *Vākyapadīya* and the *Rājataranginī* took only about twenty years to occur, *viz.*, that the Mahābhāṣya was written, that it obtained very great reputation over a large part of the country from Kashmir in the north-west to the Deccan, and came to be acknowledged as a work of authority, that it was studied generally, that in the "course of time" it ceased to be studied, and that it was brought into use again by Chandrāchārya and others. There is also a philological objection to the interpretation. Some other explanation, therefore, of the word *Mādhyamika* must be sought; and this is furnished to us by Dr. Kern, who has called attention to a passage in the *Varāha-mihira Sanhitā* in which a people of the name of *Mādhyamikas* is mentioned. My argument will be found fully stated in my reply to Prof. Weber spoken of above.—Yours truly,

RAMKRISHNA G. BHANDARKAR.

Bombay, 19th April, 1873.

#### PEHLEVI INSCRIPTIONS.

To the Editor of the ACADEMY.

Mangalore, S. Canara, Madras Presidency, May 12th, 1873.

SIR,—During a recent tour through the Cochin and Travancore States I found some Pehlevi inscriptions which go to prove that there were once large settlements of Persians, probably Manichæans, in S. India. This fact will be of interest to Sanskritists since Prof. Weber's admirable essay on the *Rāmāyana*. Prof. Weber has shown reasons for suspecting Greek influences in the composition of that poem; and it will now, in consequence of this discovery, be possible to prove that much in the modern philosophical schools of India comes from some

form of Christianity derived from Persia; and this fact at once explains also the origin of the modern Vedānta sects in Southern India exclusively.

In a Syrian (*i.e.* Nestorian) church at Koṭṭayam in Travancore, said to be one of the oldest in the country, I found at the back of a side-altar a granite slab with a cross in bas-relief on it, and round the arched top a short sentence in Pehlevi; at the foot of the cross a few words in Syriac. On looking round the church I found a similar but evidently older tablet built into the wall. This tablet is nearly covered by white-wash, but shows only a Pehlevi inscription. There is a similar tablet in the Mount church (near Madras) which has long been the property of the Portuguese.

Since my return to Mangalore I have found in Friar Vincenzo Maria's *Viaggio all' Indie Orientali*, p. 135 (Roma, 1672), mention of several such tablets; he particularly mentions the ones at Cranganore and Meliapore (*i.e.* Madras), and takes them to be relics of the mission of St. Thomas to India. As there is hardly a trace left of Cranganore, it would be useless to search there; but the older Syrian churches (at Niraṅam, Kāyaṅkulam, &c.) will no doubt furnish other copies. In this very out-of-the-way place I have nothing to help in deciphering the Pehlevi inscription, which is nearly the same on the three tablets I have seen; the first few signs, only, differ. The last word in all looks like *afzūd* (may it be increased). As soon as I can get it lithographed I shall send copies to the principal European scholars who occupy themselves with Pehlevi.

The number of these tablets proves that there must have been communities in several places, and those large enough to have churches both on the S. W. and S. E. coasts of India. Cosmas (beginning of the sixth century A. D.) mentions Christians in Male (*i.e.* S. W. India), and that there was a Persian bishop at Kalliana, *i.e.* Kalyāṇapūr, near Udipi, and in this province—a place always reputed to be one of the earliest Christian settlements in India. Nor were these Persians disliked as foreigners are now by the natives of India. Before the beginning of the ninth century A. D. they had acquired sovereign rights over their original settlement, Manigrāmam, by a grant from the Perumā. These Persians were thus established long before the origin of the modern schools of the Vedānta, and the founders of these sects were *all* natives of places close to Persian settlements. Časikarācārya was born not far from Cranganore where the Persians first founded a colony; Rāmānuja was born and educated near Madras; and Madhvācārya, the founder of the sect which approaches nearest of all to Christianity, was a native of Udipi, a place only three or four miles south of Kalyāṇapūr. A comparison of the doctrines of these sects with those of the Manichæans will I think settle the question; but I must reserve that for another occasion. That these Persians were Manichæans is, I think, to be concluded from the name of their settlement, Manigramam. This can only mean "Manes-town;" the only other possible meaning, "Jewel-town," is utterly improbable.

Prof. Weber has shown that the Brahmasamāj doctrines are an unacknowledged result of Christian missions in this century; the S. Indian Vedānta sects must be taken as a similar result of perhaps the earliest Christian (though Manichæan) mission to India.

How close the connection between Persia and India was in the sixth century A. D. is also known from the history of the European versions of the *Pañcatantra*. The existence of this work in India was then known to the Persians, and this knowledge presupposes a greater knowledge of Indian matters by foreigners than has ever since been the case up to the end of the last century.

I may remark also that the facts I have mentioned above render it probable that Būrzweih or Barzūyeh, who first translated the *Pañcatantra* into Pehlevi, was actually a Christian, as the Arab historian, Ibn Abu Oseibia, states. The S. Indian Sanskrit *Pañcatantra* is the oldest yet discovered (see Prof. Benfey's note, *Academy*, vol. iii. pp. 139-140); may not Bārzūyeh have got his copy in S. W. India?

Patriotic Hindus will hardly like the notion that their greatest modern philosophers have borrowed from Christianity; but as they cannot give an historical or credible account of the origin of these Vedāntist sects, if we take the above facts into consideration, there is

more against them than a strong presumption, for these doctrines were certainly unknown to India in Vedic or Buddhistic times.

I mentioned in my last letter the discovery of an old Jain version of the *Rāmāyana* in Canarese. This is certainly more than a thousand years old, and differs greatly from the *Vālmiki-Rāmāyana*. The Tamil version (by Kampan) is also very old, and deserves examination if the question of the original form of the Sanskrit epic is to be *really* decided. I hope soon to be able to give you some account of the Canarese version, as I have found an excellent MS., written about 420 years ago, which is wonderfully correct.—I am, faithfully yours,

A. BURNELL.

### Notes and Intelligence.

Mr. Alexander J. Ellis is engaged on an English translation of Helmholtz's great work on the theory of musical tones, *Die Lehre von den Tonempfindungen*.

Mr. Ellis hopes to complete the printing of the text of the fourth part of his *Early English Pronunciation* by the 1st September of this year. But as the preparation of the indexes will be very laborious, the issue of the volume cannot be expected before the middle of May, 1874.

Edward Thomas, Esq., F.K.S., has been elected a Corresponding Member of the Institute of France.

We learn from *Triibner's Record* that a complete set of the *Jaina Aṅgama*, with commentaries, has recently been added to the Royal Library of Berlin—the first complete set ever brought to Europe.

We learn that the Government of Dutch India has just presented to the Royal Asiatic Society, through the Batavian Society of Arts and Sciences, a collection of upwards of 300 magnificent photographs representing part of the antiquities of Java. In 1862 the late Rev. J. F. G. Brumund was, at the suggestion of the Batavian Society, appointed by the Dutch Government to survey, and furnish a detailed account of, the Hindu remains in Java. This important undertaking was unfortunately cut short in the following year by the untimely death of the reverend gentleman. He left, however, a highly interesting account of several of the most important monuments, which was afterwards published in vol. xxxiii. of the *Verhandelungen van het Bataviaasch Genootschap* (1868). Shortly after Heer van Kinsbergen was entrusted with the task of reproducing by accurate photographs the most interesting and characteristic of these monuments, in detail and from a scientific point of view. The collection, of which a copy has now reached England, is the first instalment of a series which when finished will furnish an excellent and pretty complete view of the pre-Mohammedan remains in Java. The same gentleman is at present engaged in reproducing the splendid and extensive remains in the residency of Radoe, generally known under the name of Boro-Boedoer, after which his photographic apparatus will be brought to bear on monuments of still earlier periods in that part of Java. Thanks to the enlightened policy of the Government of Dutch India and the praiseworthy and successful labours of the Batavian *Genootschap* the student of Eastern art will thus in a few years be able to avail himself of what will have to be considered as the first comprehensive view of the antiquities of an Eastern country. It may also be hoped that the Batavian Society will soon be able to procure the services of a competent scholar to continue in the same efficient manner the archaeological labours of the late Mr. Brumund.

Mr. Burnell will shortly issue the *Sāmaśiddhāntabrahmaṇa*, with Sāyana's comment, a translation and index of words, to be followed by the *Devatādhyāyabrahmaṇa* and the *Shatimsabrahmaṇa*. He is also publishing specimens of some minor dialects of the western coast of Southern India, consisting of translations of St. Matthew xiii. 1-34. Two of these, viz. in the Konkani, spoken by the Roman Catholics of South Canara, and in the Kodagu (Coorg) language have already been issued.

The same industrious scholar intends to prepare, together with the Rev. C. E. Kennet, a new translation of Beschi's *Shen Tamil Gramma*. The translation of Dr. Babington has long been out of print. "This new translation will be based on additional MSS. of the original Latin (which have never been printed), and one of which is partly in Beschi's autograph. The introduction will give an account of the origin of the Dravidian Grammars and their Sanskrit originals, most of which exist in manuscript and are unknown to European scholars except perhaps by name."

The address of M. Paparregopulos, the President of the National University at Athens, contains an account of his visit last year to our English Universities. Although he was not more than two months in England, his account of them is remarkably accurate. The University of London especially excites his admiration, but he was also much pleased with Oxford and Cambridge, where the hospitality of the Master of Trinity calls forth a warm acknowledgment. He notices the criticisms passed upon the system of Fellowships by the Rector of Lincoln and Prof. Max Müller; and warmly praises "the combination of freedom and obedience, of spiritual and bodily exercise" in the life

of the undergraduates, which he holds up to the imitation of his hearers. He also commends "the fatherly love of the colleges for the students and graduates," as well as the life in common which characterizes our English system. Possibly, however, his views would have been considerably modified by a longer acquaintance with Oxford and Cambridge; and he has not failed to be struck with astonishment at the inadequate influence of the professorial body and the neglect of study for its own sake which are too evident in our Universities. "At Oxford," he says, "I had not the good fortune to meet the famous Max Müller, as he had just gone to Strasburg to be present at the re-opening of the University there; but I can assure you that out of 1400 undergraduates who are supposed to study Greek about fourteen only generally attend his learned lectures, in which the oldest and apparently most irregular forms of Greek are explained by means of the Sanskrit." The Athenian University seems to be at present in a highly flourishing state. The number of students attending it has been steadily on the increase. Whereas in 1837-8, the date of its foundation, there were but 127, and in 1850 but 397, there were in 1871 no less than 1239, 955 of whom were subjects of the Greek Government.

Rudolf Hercher's edition of Theodore Prodromus' *Calomyomachia* (Lipsiae, Teubner, 1863) is an interesting little work. It is a kind of jocular tragedy in 384 iambic lines (in Byzantine prosody, the only law being that each line shall terminate with a paroxytonon and not exceed the number of twelve syllables), describing a contest between the Mice and the Cat (ἡ κάτα). Ψυχάρπας, the beloved son of the king of mice, is killed by the inexorable enemy, and his death is described by an ἄγγελος quite in the style of ancient tragedy. Finally, however, the cat is killed by a beam (ξύλον κατελθὼν τῆς υπερτάτης στέγης, "Ἐτεῖ παλαιῶν καὶ χρόνῳ τετραυσιμένον, Ἐπλήκην αὐτὴν ἐν μέσῳ μεταφρένῳ), and the mice are freed from their everlasting dread of her depredations. The editing is very careful; but in v. 55 we find what is probably a mere misprint, ἰσημαί instead of ἰσημί; v. 63 we should write τοῦ λάθρα ποσειδάει; v. 135 correct the misprint σρατεύει; and v. 145 we consider the correction σύμπαντες instead of ἀπαντες very unnecessary, comp. 208. An important correction is v. 265, where Hercher's edition reads αὐτὴν διαχρήσαμιν, though it should be αὐτῇ. The Byzantine writers often use the reflective pronoun of the third person instead of the first and second.

W. W.

A complete edition of K. O. Müller's minor works on art and archaeology, in five volumes, has just been published by Messrs. Calvary, of Berlin. In the preface to the fifth volume it is stated that this valuable collection of the great philologist's smaller essays and treatises is to be considered as the forerunner of a new and enlarged edition of the well-known *Handbuch der Kunstarchaeologie* by the same author.

We understand that a new edition of Bentley's Dissertation upon the Epistles of Phalaris, together with his short dissertations on the Epistles of Themistocles, Socrates, Euripides, and the Fables of Æsop, by Dr. W. Wagner, of Hamburg, is in the press. The new edition will be a faithful reproduction of the original edition, and will thus be superior to Dyce's edition, in which Bentley's spelling was modernized throughout. There will also be philological notes and an introduction.

A new edition of *Fronto*, by Professor W. Studemund (at Strasburg), is ready for press. The new edition of *Gaius* by the same scholar is likewise reported to be on the eve of publication.

Beside the *Studies* published by G. Curtius, and the *Acta societatis philologicæ* of Ritschl, we have to announce the publication of a new collection of similar "studies": *Studia in priscos scriptores latinos collata*, by W. Studemund. The first half of the first volume (viii. and 316 pp.) has just been published by Messrs. Weidmann at Berlin. It contains *Quæstiones metricæ* by A. Luchs, *De retractatis fabulis Plautinis* by L. Reinhardt, and a very full treatise *De Syntaxi interrogationum obliquarum* by E. Becker. The editor himself has added what may (though the expression seems odd) be termed quite an amiable preface.

G. Curtius is about to bring out a new edition of his work on Greek etymology, and a new treatise on the organism of the Greek verb.

The first volume of the *Ephemeris Epigraphica* (Berlin, Reimer) is now complete.

From Dorport (W. Glaeser) we receive a volume of *Addenda Lexicis Latinis* by C. Pauker, containing a pretty large number of words, mostly from late Latin authors.

Dr. O. Clason is working at a continuation of the well-known Roman history of A. Schwegler, and the first part of his work is already in the press. It will be published by Messrs. Calvary, of Berlin.

In July there will be a Congress of Orientalists at Paris. We hear that a considerable number of English and German scholars have been named honorary correspondents to this Congress.

### Contents of the Journals.

The *Indian Antiquary*, ed. by Jas. Burgess. Bombay. Part XIV. February, 1873.—The Chandel Thákurs; by F. N. Wright.

[This account of the Chandels is taken from two modern family histories, one of which is in Persian, the other in Hindi.]—The Early Vaishnava Poets of Bengal, i. Bidyapati; by J. Beames. [This poet, whose real name was Basanta Rai, is said to have lived from A.D. 1433 to 1481. His language may be regarded as the representative of the period of transition of an original branch of the Hindi into Bengali as a separate dialect. Several specimens in the Roman character are given with translations and a brief grammatical sketch.]—Notes on Junnar Táluka; by W. F. Sinclair. [Continued; account of the city of Junnar and its remains.]—Coorg Superstitions; by Rev. F. Kittel. [Worship of ancestors and demons among the Coorgs.]—The Menhirs of the Hassan District; by Capt. J. S. F. Mackenzie. [Account of the monumental stones in that district.]—Marasa Vakkaligaru of Maisúr; by V. N. Narasimmiyengar. [These people form a subdivision of the Rayat class of Mysore. Among them a peculiar rite is prevalent: their women on becoming mothers offering as a sacrifice to Bhairava Linga the first joints of their right hand ring and little fingers, which are cut off by the village carpenter. Some, however, substitute pieces of gold wire, while a few families repudiate the rite and worship Vishnu.]—Pyal Schools in Madras; by the late C. E. Gover. [Interesting account of a native school. The Pyal is a bench built against the front wall of every Hindi house in Southern India, usually sheltered by a verandah; on this the children are seated.]—Review (favourable) of J. Dowson's Grammar of the Urdu or Hindustani Language. Correspondence and Miscellanea. [Controversy between Profs. Weber and Bhandarkar on certain passages in the *Mahábháshya*.]

Part XV. March, 1873.—The Kulwadi of the Hassan District; by Capt. J. S. F. Mackenzie. [The Kulwadi, the headman of the Holiars or outcasts living outside the village boundary hedge, were originally the rightful owners of the villages. They now perform the duties of a headle or policeman. He still receives from the friends of any person who dies in the village a certain fee "to buy from him the ground from the dead."]—On the Subdivisions of the Bráhmán caste in Northern Orissa; by J. Beames. [List of the divisions according to the different vedas.] Patanjali's *Mahábháshya*; by Prof. R. G. Bhandarkar. [A third passage from the great commentary on Pānini bearing on the date of King Pushpamitra; also two passages from the same work, from which the Prof. B. infers that the Gonarda mentioned as the native country of Patanjali is identical with the modern Gonda, some twenty miles to the north-west of Oudh, whilst Prof. Weber thinks that he lived to the east of Patna; and that Kátyáyana, the author of the *Várttikas*, was a native of the south of India—not, as has been hitherto assumed, a grammarian of the Eastern school.]—The Date of Śrī Harsha; by K. T. Telang. [The writer states his reasons for doubting the authority of Rājasekhara, the Jain author of the *Harshaprabandha*, as to the date of Śrī Harsha, the author of the *Naishadhya*.]—The Embassy to Khatá or China, A.D. 1419; by E. Rehatsek. [Translated from the Persian of Muhammad Khavend Sháh, or Mirkhond's *Rousat-al-Ssaft*. The embassy was sent by King Mirzá Sháh Rokh, son of Tamerlane, and started from Herát.]—Progress of Oriental Research in 1870-71. [From the Annual Report of the Royal Asiatic Society, June, 1872.]—Cromlechs in Maisur [from a Memorandum by Capt. R. Cole.]—The Asiatic Societies.—Review (favourable) of W. G. Palgrave's *Essays on Eastern Questions*; by A. H. B.—Correspondence and Miscellanea [on Indian Dates, by Jas. Fergusson; on the Interpretation of Patanjali, by R. G. Bhandarkar, &c.]

## THE ACADEMY.

"INTER SILVAS ACADEMI QUÆRERE VERUM."

Vol. IV.—No. 73.

*Readers are reminded that the mention of New Books, Articles, &c., in our lists is intended as a guarantee of their importance.*

*The Editor of THE ACADEMY cannot undertake to return communications which are not asked for.*

*The Editor cannot reply to questions from authors respecting the notice of their books.*

*The next number will be published on Tuesday, July 1, and Advertisements should be sent in by June 27.*

## British Association for the Advancement of SCIENCE,

22, Albemarle-street, London, W.

The NEXT ANNUAL GENERAL MEETING will be held at BRADFORD, commencing on WEDNESDAY, September 17.

President Elect.

J. PRESCOTT JOULE, D.C.L., LL.D., F.R.S.

NOTICE to CONTRIBUTORS of MEMOIRS.—Authors are reminded that, under an arrangement dating from 1871, the acceptance of Memoirs, and the days on which they are to be read, are now, as far as possible, determined by Organizing Committees for the several Sections before the beginning of the Meeting. It has therefore become necessary, in order to give an opportunity to the Committees of doing justice to the several communications, that each Author should prepare an Abstract of his Memoir, of a length suitable for insertion in the published Transactions of the Association, and that he should send it, together with the Original Memoir, by book-post, on or before September 1, addressed thus—"General Secretaries, British Association, 22, Albemarle-street, London, W. For Section....." If it should be inconvenient to the Author that his Paper should be read on any particular day, he is requested to send information thereof to the Secretaries in a separate note.

Information about local arrangements may be obtained by application to the Local Secretaries, Bradford.

G. GRIFFITH, M.A., Assistant General Secretary, Harrow.

## School of Chemistry, 20, Gt. Marlborough-st.

Directed by  
ARTHUR VACHER, F.C.S.

The Instruction is essentially practical; there are no Lectures. Each Student works independently.

The Course of Study is arranged to qualify the Student as an Analyst and to enable him generally to apply the Science to any Branch of Industry. But the Students are free to pursue their own particular Object.

The Hours are from Ten to Four. On Saturdays the Laboratory is reserved for Ladies.

The Charge is five Pounds per Month. This includes Instruction, Chemicals, Apparatus, &c. Occasional Students are received at the same Rate, namely ten Shillings per month for each Half-day in the Week. Schoolmasters requiring personal Instruction pay Half-fees.

Just Published, price 6s.

## A Grammatical Analysis of the Hebrew

Psalter; being an Explanatory Interpretation of every word contained in the Book of Psalms, intended chiefly for the use of beginners in the study of Hebrew. By JOANA JULIA GRESWELL.

JAMES PARKER &amp; Co., Oxford, and 377, Strand, London.

Just Published.

## Homer's Odyssey. First Twelve Books. In

two vols., 8vo. Edited by HENRY HAYMAN, D.D., Head Master of Rugby School, with prefaces, notes, and appendices, and collations of several MSS. Price of each volume, 14s.

D. NUTT, 270, Strand.

CHEAPER EDITIONS.

Social Statics; Or, the Conditions essential to Human Happiness specified, and the First of them developed. 8vo cloth, 10s.

Essays: Scientific, Political, and Speculative. (Being the First and Second Series re-arranged, and containing an additional Essay.) 2 vols. 8vo, cloth, 16s.

WILLIAMS & NORGATE, 14, Henrietta-street, Covent Garden, London; and 20, South Frederick-street, Edinburgh.

Just published, crown 8vo, price 5s.

## The Dialect of Cumberland; with a Chapter

on its Place-Names. By ROBERT FERGUSON, Author of "The Teutonic Name-System," "The River-Names of Europe," &c.

By the same Author, 8vo, price 14s.

## The Teutonic Name-System, applied to the

Family Names of France, England, and Germany. "The interesting and comprehensive problem the author himself thus sets before us. His object is to bring into connection the family names of France, England, and Germany, so far as the German element is concerned, as members of one common family, and to arrange them on a definite system, in accordance with the nomenclature of the old Germans. He holds the opinion that a large proportion of French as well as of English names are of Teutonic origin, which, heretofore, has not been assumed to be the case to the same extent. . . . All this he has worked out with independent judgment, and, it must be admitted, with general correctness; he has, moreover, made some new suggestions, which commend themselves, for the explanation of French and English names."—*Professor Dietrich, in the Jahrbuch für Romanische und Englische Literatur.*

Also, by the same, post 8vo, price 4s. 6d.

## The River-Names of Europe.

"The most uninterested reader may find himself amused as well as edified."—*Athenæum.*

"Mr. Ferguson brings much learning and ingenuity to his self-imposed task."—*Notes and Queries.*

WILLIAMS &amp; NORGATE,

14, Henrietta-street, Covent Garden, London; and 20, South Frederick-street, Edinburgh. STEEL BROTHERS, Carlisle.

Just Published, in royal 8vo, price 10s. 6d. cloth.

## The Pandects: a Treatise on the Roman Law,

and upon its Connexion with Modern Legislation. By J. E. GOUDSMIT, LL.D., Professor of Jurisprudence in the University of Leyden. Translated from the Dutch by R. DE TRACY GOULD, M.A., Counsellor-at-Law.

London: LONGMANS, GREEN, &amp; Co., Paternoster-row.

No. I. in 8vo, 268 pages, price 4s. sewed.

## Hermathena: a Series of Papers on Literature, Science, and Philosophy. By Members of Trinity College.

Dublin. (To be continued Annually.)

London: LONGMANS &amp; Co. Dublin: E. PONSONBY.

## General Literature.

*Idylles Prussiennes.* Par Théodore de Banville. Paris : Lemerre.

THERE occurs in La Mettrie's hoaxing dedication of *L'Homme Machine* to Haller one of those *traits de flamme* which even Voltaire was obliged to recognise in the joyous doctor. Pronouncing a half sincere, half exaggerated encomium on the merits of science and art, he complains that intellectual and artistic pleasures are in fact too intense and entrancing. Their intensity blunts the enjoyment of them. But fortunately there is a remedy, and it is to be found in the pleasures of sense. In order, he says, properly to enjoy the delights of study and culture, "j'ai quelquefois été forcé de me livrer à l'amour." Even if allowance be made for the paradoxical irony of the sentiment (and La Mettrie is usually most nearly sincere when he is most paradoxical), it still affords glimpses of a reading of the life of enjoyment, which if not exactly new has not often been attempted in modern times. It would be interesting to consider how far an impartial devotion to Muse and Grace, to Athena and Aphrodite is a possibility; how far a genuine enthusiasm for sensual pleasure can be combined with a genuine appreciation of study and of art. The consideration, unfortunately, would have to be purely theoretic : for practical examples we must wait for a distant future—till sensualists are philosophers, or philosophers sensualists.

But should there ever arise a sect or society of aspirants to the perilous and doubtful glory of thus serving two masters, the poet whose name stands at the head of this article would have an undoubted claim to the honours of their laureateship. For almost alone among the modern romantic school of Europe, the descendants of Byron, of Shelley, and of Heine, M. Théodore de Banville has managed to introduce measure and order into the service of his peculiar gods. He takes the yew and the roses which form the crown of Aphrodite; but they are poisonless and thornless to him, or rather the poison produces but a generous intoxication, and the thorns act only as a harmless stimulus. His passion is neither forced nor stunted, his expression neither laboured nor over-confined—the rule of "not too much" appears to be observed without effort as without error. His muse is *chercheuse d'infini*, but not *ad infinitum*. In his celebration

of the mysteries there is neither howling, nor writhing, nor gnashing of teeth. Nemesis and Koros seem to pass him by. The utmost penalty paid for any raptures in which he may indulge—nor are they few or mean—is a graceful and rather salutary melancholy, which seems to have the effect at once of soothing the nerves for what is past and of strengthening them for what may be to come. Among his despairing brotherhood he alone despairs not of the earthly paradise, and evades by some happy expedient of temperament or of art, the fatal contact of the fiery sword.

Although ranking in point of form and character among the latest and most modern of writers, Théodore de Banville is by no means in the literal sense a young poet. He belongs in fact to the generation which came between the great stars of 1830, now, alas ! all but departed, and the rising celebrities of the Empire and the third Republic. It is thirty years and more since the *Cariatides* appeared. During this time the productiveness of the author has been constant; but his works have appeared in a very large number of small publications many of which have been for some time out of print, and the complete edition lately undertaken by M. Lemerre will afford the first fair opportunity of judging the author's work and genius as a whole. The present article will not attempt to do more than notice three productions which present M. de Banville under curiously different aspects—that is to say, the work now introduced as text, the *Odes Funambulesques*, and the most remarkable poems which formed part of the *Parnasse Contemporain* for 1869, the publication of which was interrupted by the war. Naturally the reader will not look for a very positive display of the qualities which we have praised, in such a work as the *Idylles Prussiennes*. The poetical merits of the vast volume of verse poured forth in France during 1870-71 are as a rule but small. Helpless rage is unfortunately apt to be undignified, and no Prometheus has yet appeared in France as an exception to the rule. Few if any French poets have resisted the temptation to console themselves for perpetual, not to say disgraceful, disaster by extravagant self-laudation. Now the only way of rendering such extravagance tolerable is to clothe it in rhetoric of sufficient power and gorgeousness; and declamation is by no means M. de Banville's forte. In this he differs strikingly from another great contemporary poet, Leconte de Lisle, from whose works specimens of

almost perfect declamation—such as for instance the wonderful passage in *Les Runoias* beginning “Vous ne chanterez plus sur vos harpes de pierre”—can be produced in profusion. But our author has neither miscalculated his powers nor attempted an unsuitable task; on the contrary he has given yet another example of the reticence and self-control for which he has already been praised. Avoiding the common and fatal error of pitching the voice in the popular key, he has by skilful depression and transposition obtained a suitable style—the style of meditative and almost humorous satire, of which he is a master. The result, making allowance for the enormous difficulties of subject and treatment, is certainly a success; perhaps it is not unsuccessful even if such allowance be not made. It is not to be denied that the wit is sometimes forced, and the mirth not unfrequently a mere *rire jaune*, but on the whole Théodore de Banville may be safely pronounced to have achieved more thoroughly than any other French poet the perilous and ungrateful adventure which he has undertaken. There are, of course, many pieces in the volume which are not entitled to any share of this praise. Some are trivial; a few, such as “Cauchemar” and “Le Mourant,” are not free from the immoderate invective and the theatrical patriotism which disfigured “L’Année Terrible.” “Le Turco,” whatever it may be to French taste, is to English critical eyes simply vulgar. But there are others which show none of these faults. “La Bonne Nourrice” gives a fine picture of Death, helmeted and purple clad, lulling her beloved Bismarck to sleep. “L’Ane” and “Les Rats” are two decidedly good satirical pieces, suggested by the omnivorous habits of the besieged Parisians. In the former the poet after a most quaint description of the merits, defects, and sufferings of the unlucky animal, who after all

“Nous croit bons, rêveur charmant !  
Nous flatte de sa longue queue,  
Et nous regarde tendrement  
De sa vague prune bleue :”

laments the final injury—the ass is actually eaten! Nay more, he is found so good that

“A l’avenir on mangera  
Toujours des ânes, sans nul doute !”

Then suddenly turning from asses literal to asses metaphorical, he begs various personages, in a formidable list, to reassure themselves. Some of them must escape:

“Jamais nous ne pourrons venir  
A bout de manger tous les ânes !”

“Marguerite Schneider” is a really fine address to the young damsel whose fondness for earrings gave her so evil a notoriety. The poet proposes as the most appropriate pendants two drops of blood, ruby-like and ever ready to fall. But the gem of the book is without doubt “L’Épée.” This piece forms a perfect and possibly a designed counterpart to the famous sword-song of de Banville’s namesake Körner. It deserves quotation at length, but we must unwillingly leave it unquoted here.

Of the whole volume it may be said that the form is incomparably superior to the matter, and this fact, which is not likely to render it popular with the average reader, must always give it a special interest in the eyes of the instructed and critical lover of poetry.

Still dearer to such a critic should be the *Odes Funambulesques*, and for the same reason. It is probable indeed that this wonderful book has not found many English readers, not merely because of its multitude of minute Parisian details and personalities, but still more, it is to be feared, because comparatively few Englishmen have the patience or the inclination to observe the artistic excellence of its grotesque extravagances. An English critic once held it up as a sort of scarecrow, an instance of the inevitable tendencies

of the romantic school. If it be so, so much the better for the school which can “inevitably” produce such poems as “La Belle Véronique,” “Variations Lyriques,” “La Ville Enchantée,” and above all the epilogue, and so to speak moral, of the book, “Le Saut du Tremplin,” where

“Enfin de son vil échafaud  
Le clown sauta si haut, si haut,  
Qu’il creva le plafond de toiles  
Au son du cor et du tambour,  
Et le cœur dévoré d’amour  
Alla rouler dans les étoiles.”

So much the better for the school which can thus vindicate the assertion, made in the fine poem which does duty here as prelude, that the artist, be he orator, prophet, or buffoon, whatever be his audience and whatever his message, is

“Toujours au dessus de la foule.”

In *Idylles Prussiennes* we have the poet struggling with, and in a great degree mastering an unpromising, uncongenial, but inevitable subject; in *Odes Funambulesques* we see him voluntarily assuming the motley that he may prove the omnipotence and omnipresence of his art, and its fitness at all times and in all places for making the common as if it were not common. But to relieve this view of Art Militant, now with helmet and sword, now with cap and bauble, it is only fair to give a glimpse of the poet’s Art Triumphant, in her peculiar sphere and treating congenial subjects, representing above all things

“The crescent life and love the plenilune.”

For this purpose Théodore de Banville’s contributions to the *Parnasse Contemporain* (November, 1869) are especially suited, being his last production before the disturbing events of 1870. They consist of one poem of some length, “La Cithare,” admirable in style and language, and recalling by its semi-classical manner the earlier works of the poet, and of ten ballads composed “à la manière de François Villon.” These latter are all good, especially that “Des Belles Chalonaises,” and “De la Bonne Doctrine;” but there is one of such supereminent beauty that it must be quoted at length. It is entitled “Ballade de Banville aux Enfants Perdus.”

“Je le sais bien que Cythère est en deuil !  
Que son jardin, souffleté par l’orage,  
O mes amis, n’est plus qu’un sombre écueil  
Agonisant sous le soleil sauvage.  
La Solitude habite son rivage.  
Qu’importe ! allons vers les pays fictifs !  
Cherchons la plage où nos désirs oisifs  
S’abreuvèrent dans le sacré mystère  
Fait pour un chœur d’esprits contemplatifs :  
Embarquons-nous pour la belle Cythère.

La grande mer sera notre cercueil :  
Nous serverons de proie au noir naufrage,  
Le feu du ciel punira notre orgueil  
Et l’aiglon nous garde son outrage.  
Qu’importe ! allons vers le clair paysage.  
Malgré la mer jalouse et les récifs,  
Venez, partons comme des fugitifs,  
Loin de ce monde au souffle délétère.  
Nous dont les cœurs sont des ramiers plaintifs  
Embarquons-nous pour la belle Cythère.

Des serpents gris se traînent sur le seuil  
Où souriait Cypris la chère image.  
Aux tresses d’or, la vierge au doux accueil !  
Mais les Amours sur le plus haut cordage  
Nous chantent l’hymne adoré du voyage.  
Héros cachés dans ces corps maladifs,  
Fuyons, partons sur nos légers esquifs  
Vers le divin bocage où la panthère  
Pleure d’amour sous les rosiers lascifs :  
Embarquons-nous pour la belle Cythère.

#### ENVOI.

Rassasions d’azur nos yeux pensifs !  
Oiseaux chanteurs, dans la brise expansifs,  
Ne souillons point nos ailes sur la terre,

Volons, charmés, vers les dieux primitifs !  
Embarquons-nous pour la belle Cythère."

What can or need be said of such a poem as this but that in thought, expression, language, metre, rhythm it is perfect? that the sequence of the ideas is only equalled in beauty and completeness by the cadence and harmony of the accompaniment? If lyric verse be, as it is in truth, the nominative of poetry, whence all other kinds are but cases and deflections, Théodore de Banville needs to advance no other proofs to assert his claim to a place among the first of contemporary poets. GEORGE SAINTSBURY.

*Kinder der Welt.* A Romance. By Paul Heyse. Hertz, Berlin. 1873.

*By and By.* An Historical Romance of the Future. By Edward Maitland, author of "The Pilgrim and the Shrine." Bentley. 1873.

THESE two works have this much in common, that they are both evidently intended to prove something, but what, and more especially to whom, is so obscure that we are inclined to echo the end of Mr. Maitland's preface: "Who but the artist knows the artist's ideal?" As works of art, however, it would be unfair to class them together, for though Heyse has always been least successful in his longest works, and in this, his first full-length romance, has further burdened himself with the dead weight of a didactic purpose, his style is always finished, and he has always some scenes and characters touched in with real grace and poetic originality; while *By and By* is both incoherent in design and careless in composition—essentially what Mr. Hamerton calls an "undisciplined" book. If, as seems probable, the purpose of both writers is to recommend the precise variety of theism or atheism professed by the principal character in each work, it may be doubted whether the means are discreetly chosen. It is usual in the early days of a religious movement for novels to be written to illustrate the doctrines and practices of believers and the iniquity of the outer world; but religious novels have a bad name in literature, and to the unprejudiced, profane public it will scarcely be a recommendation of the religious views of Dr. Strauss or our undogmatic English Theists that they too can inspire fictions which, like those of Mrs. Sherwood or Miss Sewell, may be extremely edifying to the faithful, but will hardly be found convincing except by the converted. On the other hand we can scarcely understand how the faith of full-fledged philosophers, in whose mouth Schopenhauer and Comte and Spinoza and the grey matter of the brain are familiar household words, should need strengthening by such an exercise of the novelist's prerogative as consists in making his villain a candidate of theology. But perhaps we ought not to assume that *Kinder der Welt* is exactly meant to prove the doctrines advocated by all the virtuous characters in the book: it may be only intended to illustrate the thesis that opinions about the cause and constitution of the universe have very little influence either for good or evil upon the passions or conduct. At least Edwin, the hero, who is an extremely enlightened philosopher, falls in love as violently and unreasonably as the most antiquated theist, and has to have a brain fever before he is ready to be consoled by a young lady to whom he had been giving lectures in philosophy until her father's orthodoxy took alarm. When the lectures were interrupted she begins to die for love, partly of Edwin, partly of philosophy, but is restored by a declaration in the following terms: "What I feel for you—he stopped with a gentle smile—we had not got so far as Spinoza for the scholastic term to be familiar to you:—but look! the feeling of man towards what that high sage called God, the absolute Substance which acts and wills and embraces everything, that exaltation of every feeling

which follows when we plunge ourselves in thought into the being of this All and One—he calls 'intellectual love.' It is neither a jest nor a blasphemy, but the simple expression of truth when I say, with such a love I love thee, Leah! That blind, daemonic passion otherwise called love is washed out of my blood, I hope for ever. What now lives in me is the blessed knowledge that thou art the best, the profoundest, most gracious, and most noble human shape that has ever appeared upon earth, the One and All in which my world is contained and resolved, and that the man whom thou shouldst love and to whom thou wert willing to belong were the happiest of mortals!" There are pages enough in this vein to be a severe trial to the patience or gravity of irreligious readers. The first half of the book is the best, and the character of Balder, Edwin's younger brother—a beautiful cripple, who never leaves his garret-lodging, but finds in his friends, his verses, his turning-lathe, and the shoemaker's daughter who waits on him all the elements of enjoyment which attach more fortunate mortals to life—is the most attractive feature in it: the author's bright, sympathetic treatment of the conception is in his best manner. But Balder dies, partly because the shoemaker's daughter is betrothed to somebody else, and his friends instead of arranging for his interment without religious rites, or with such rites only as they might please to invent, accept the ministrations of an orthodox clergyman and then are indignant at his thinking it necessary to pray for the sinful soul of the departed. If the "children of this world" are as numerous in proportion in Germany as Herr Heyse implies it is strange that their practice in this respect should be so much less logical than in France or even in England. The character of Toinette, Edwin's first love, is also open to exception, especially in a work containing a good deal of physiology. The author seems to consider that to be *von adel*, even if only on the father's side, is an organic disease affecting the blood, passing the powers of philosophy to remedy, and condemning the victim to take refuge in discreet and dignified suicide. He fails to see that a moral peculiarity if it could be accounted for scientifically by physical causes would cease to be a subject for imaginative treatment: constitutional insanity is of no more use to a novelist than hereditary gout: and on the other hand if the defects in Toinette's moral organisation were only such as ordinary mortals may have to encounter it is a confession of weakness on behalf of the doctrine which she shares with her friend the professor that it cannot help her under such a very ordinary misfortune as marriage to a stupid count. The book is unsatisfactory as a whole because, while it discusses serious questions at considerable length, it takes a solution of them for granted which would have been found much more fruitful if the grounds of its acceptance had been more clearly apprehended.

Of *By and By* there is really little to be said unless the author means this description of a successful book to be applied to it: "As it consisted of ideas already floating more or less vaguely in men's minds, and flattered the most popular feelings, it was very appropriately called, *In the Air; or, Made to Sell.*" Even an extravaganza wants to have some internal consistency, and the most obvious objection to this "romance of the future" is that it does not describe the future either as the author supposes that it will be or as he thinks it desirable that it should be. Ballooning and telegraphy are the only arts or sciences in which material progress is represented as having been made, and constant references to trifling controversies of the present day, which will certainly be forgotten before the end of the century, show how little trouble the author has taken to realize his own invention in all its details. It is extremely doubtful

whether in "*Pan trois mil*," or whatever is the date of Mr. Carol's life and adventures, the Albert Hall will still be regarded as a "noble monument," and it is scarcely conceivable that at that remote date, and after a great intellectual movement which is called the "Emancipation," the small surviving sect of Christians known as the "Remnant" should be able to resist the spread of aerostatics as irreligious and generally preserve intact the traditions of the religious school against which the author's animadversions are directed. But if the picture given of the future is too inconsistent to be meant for prediction, it is so unattractive that it cannot be intended as a model or ideal to be aimed at. Besides the limitation implied in the nature of things—for of course an author cannot make his wisest characters utter more wisdom than he can himself invent for them—it is certainly high treason against the race to represent posterity as actually more foolish than the present generation, and this is what, consciously or otherwise, Mr. Maitland certainly does. Not content with traducing men and women, he actually invents bodily angels who can be reached by balloon; but he does not explain how their existence has escaped the telescope if they reside in regions where the atmosphere is dense enough to support human life. The author has been at some pains to re-arrange the marriage laws of the future, apparently in the interest of unborn novelists who would have a fresh way of tormenting their heroes and heroines when it was possible not only to make them marry the wrong person, or fail to marry the right one, but to make them marry the right person in what might turn out to be the wrong way. These and other innovations are represented as leaving the world in essentials very much as they found it, and since Heyse's graver speculations tended to the same result, which is not an attractive prospect to the hopeful and credulous public which the religious novelist must be supposed to address, it may be doubted whether on this occasion it can be said that "the children of this world are in their generation wiser than the children of light." EDITH SIMCOX.

#### LITERARY NOTES.

The incontestable reputation which Sir Arthur Helps has earned as a lay preacher has on the whole been rather diffused than lowered by his unremitting productivity, which is always bringing him within the reach of new readers. This portion of his public will probably thank him for calling their attention by a very pretty reprint to his tragedy of *Oulita the Serf* (Strahan & Co.) The hero is a reforming Russian nobleman intimate with the Czar, who endeavours to cheat the hostility of the head of the police by marrying an influential princess. Before the marriage is accomplished he falls in love with the princess's favourite serf. His first scheme of buying his mistress is made very unnecessarily to subject her to peril of the lash, and he is driven to arson and homicide in order to rescue her. The princess has the generosity to provide him with a paper certifying that Oulita has been legally sold by her father to the hero's agent.

Oulita after living happily for a month under the protection of her lover gives herself up to the princess because she observes that anxiety to protect her is absorbing his powers and diverting him from his career of reform. The princess is of course won by her magnanimity and determines to make the lovers happy. Unfortunately the hero is arrested and sent off without delay to Siberia: Oulita however forces herself into the presence of the Czar, who for some incomprehensible reason decides that the scandal of a pardon will be mitigated by a loveless marriage (to be followed by a separation) between the hero and the princess. The princess is as eager as Oulita to sacrifice herself, but the hero whom they overtake on the road to Siberia explains that he cannot accept his pardon at such a price, whereupon Oulita kills herself in his sight under the absurd idea that he will then feel free to marry the princess.

This is not a more ridiculous story than that of most of the

Elizabethan tragedies, but in the Elizabethan age passion was not incompatible with dignity and habitual self-restraint was not a condition of self-respect: in *Oulita* the characters maintain an unbroken decorum which is only thrilling in combination with the most exact and finished realism; they are incapable of doing more than thinking aloud about the situation so as to bring in as much of the author's philosophy as can be done without too glaring incongruity. Even under these conditions the author philosophises with his usual measure of insight, though perhaps the limits of his insight become more conspicuous in a tragedy than in an essay or a dialogue: lookers on it is said see most of the game, but they never see what makes the game worth playing, if it is worth playing—which such books make us doubt. It should be added that the situations of the play, especially the last, are fine in themselves, though the author has known neither how to introduce them rationally nor how to use them passionately. The play contains several lyrics, which are not the only feature which reminds us of Sir Henry Taylor.

The turbid reveries that lie between boyhood and manhood are generally unconscious and inarticulate: people think little of them, and speak of them when they are over as nonsense that it does a young man good to have had knocked out of him. Mr. Sinclair's poems (Provost & Co.) are an attempt to embody and interpret these moods of morbid exaltation and depression. A sympathetic reader will find in them much heat, some sweetness, a little strength, even light enough for misty brightness but not for clearness or beauty. The verse moves stiffly but not without something of a manly gait, that might march or even dance—if it could get its lameness cured.

Mr. Drummond's book on the Life and Character of Erasmus (Smith, Elder, & Co.) is as good as it could be within the limits which the author has imposed upon himself. He has confined himself strictly to Erasmus' personality, and he has treated Erasmus as his own best biographer. In one sense this is true: Erasmus' letters contain materials for a copious life, and they are very lively and amusing, though to a certain extent monotonous. But without being deliberately uncandid Erasmus was continually posing; he was querulous, and he looked upon himself with the eyes of a man always repelling detraction and extorting recognition; moreover he had the tact, the modesty, the rhetorical skill to do all this with effect. The consequence is that a copious life of Erasmus based upon his own letters gives an impression of the man which perhaps his contemporaries would find it hard to recognise even when the necessary rectifications have been made. We doubt whether even in the account of Erasmus taking the vows Mr. Drummond's rectifications go far enough, and there can be little doubt that M. Du Laur has appreciated the true character of the sponging correspondence with Battus better. Both biographers have been duped by the audacious anachronism whereby Erasmus took up the position of a victim in his controversies with Bedda and other Catholics, though in fact he was treated with a forbearance which his reputation and plausibility of statement are hardly sufficient to explain, especially when we remember that he had no speculative basis for his unfailing loyalty to Rome in practice.

As it is impossible to write Erasmus' life fully except from the letters it is to be wished that Mr. Drummond had condensed the personal narrative, and utilised the space thus gained for a discussion of some of the numerous questions which naturally arise out of the relation of Erasmus to his age. What was the real internal condition of the great monastic and scholastic corporation which he attacked? how came it to be so completely separated in its interests and tendencies not only from the papal court but from the higher clergy? how far was the mendicant temper of Erasmus personal to himself? how far was it the result of the dependent condition which he shared with other scholars of the age? Of course these are collateral points, but they are quite as relevant to the main subject as the trite distinction between the Lutheran and Roman doctrine of Justification to which Mr. Drummond has thought it necessary to devote a chapter, or the comfortable commonplace about civil and religious liberty which he repeats as complacently as if it were certain that Luther was a precursor of Locke.

Again, has everything been said about Luther and Erasmus when it has been explained to the comprehension of Exeter Hall that Erasmus really was a Roman Catholic except so far as he was a Rationalist? Would not a more detailed and chronological treatment of the subject have done something to confirm the popular impression that fear partly for his person, partly for his position, was the dominant though not the only motive of the great humanist's conduct throughout the last nineteen years of his life? It is true that he never had to do actual violence to his conscience, but was there not a time when his conscience reproached him for not supporting Luther with the whole weight of his authority yet unimpaired by tergiversation on the question of indulgences, when he believed he was substantially right? (to the last he recoiled much more from the lawlessness of Luther's action and from the headlong unreason of his method than from the brutality of his doctrine). Was there not another time when his conscience reproached him, though less loudly, for his complaisance to the tyrannical iconoclasts who had driven him from Basle?

The shortcomings of Mr. Drummond's book are at once more definite and less conspicuous than its merits: of the latter it is enough to say that the writer is always clear, trustworthy, and readable, and that his matter is always full enough and well digested. It is hardly a fault that he has made himself so much at home in Erasmus that he Latinises a proper name now and then in a way that might puzzle the uninitiated, giving us *e.g.* Pannonia for Hungary.

## Art and Archaeology.

**Monuments of Early Christian Art, Sculpture, and Catacomb Paintings.** By J. W. Appell, Ph.D. Chapman and Hall. 1872.

A COMPLETE manual, with descriptive notices however slightly drawn up, of the monuments of early Christian art, comprising those to be found in all European cities, churches, cemeteries, &c., would satisfy a want generally felt; and if supplied with breadth of knowledge, with impartiality and clearness superior to all prepossessions of sectarianism, such a work might avail for determining the true import of evidences, in the monumental range, to the doctrines and practices of the ancient Church.

The small volume by Dr. Appell which is before me has somewhat higher claims than those modestly announced in its preface, being indeed a good deal more than a "catalogue" of such relics as "early Christian sculptures to be found in ecclesiastical buildings of Rome and other cities," and "the more curious catacomb paintings."

One may regret that such an opulent and highly valuable class of art-works as the Christian mosaics should be omitted from this learned writer's scope and pages. The productions of that art, applied to the illustration of sacred subjects in Rome and Ravenna alone, form a cycle for monumental records throwing light on the religious ideas, the devotional usages, the symbolism and priesthood of ancient Christianity. Marked by many analogies with the primitive art found in the cemeteries called catacombs, those mosaics display more of vigour and freedom, and at the average amount of the excellence distinguishing them, prove more impressive than the earlier or contemporary art fostered by the Church in other walks. A principal witness fails to obtain hearing, a chain of evidence is wanting, if these valuable and expressive art-works are omitted.

In the task undertaken, and within the limits prescribed to himself, our author fulfils his promise carefully, conscientiously, and with earnestness of feeling. Alike free from bigotry and from levity, he writes for no party, aims at no theological advocacy of preconceived doctrinal views; and his estimate of the bearings of early Christian art upon the dogmas and life of the ancient Church could not pos-

sibly offend either the Roman Catholic or the Rationalist. Arrangement, selection, citation of and reference to authorities are just as one can desire in this acceptable volume. The numerous engravings, shaded or outline, from well chosen subjects, add greatly to its value, and are all (so far as I can bear witness) correctly designed from the originals—the drawings thus produced having been, we are informed, executed with much care on wood by Mr. Andrew Reid. A few inaccuracies may be pointed out in the letter-press; and an occasional want of precision, where the author describes or particularizes, reminds us of what indeed there is no attempt to conceal—that he does not write from personal observation of all the objects mentioned, but satisfies himself with citations from others, and sometimes from authorities accredited indeed, but not always agreeing with each other. In reference to the sense and value of the range of art in the Roman "catacombs," it is difficult to strike the balance justly between such conflicting testimonies, as De Rossi, Northcote, and Brownlow on one side, and on the other Maitland, Marriott, Parker. But highly important is it that that balance should be correctly adjusted. One may accept with unreserved reliance, and be glad to see so often cited in these pages, such authorities as Bottari, Agincourt, Piper, Martigny; but Perret's *Catacombes de Rome* may be objected to on account of the manifestly embellishing, and indeed almost idealizing process to which the olden and quaintly characteristic originals are subjected in the chromolithographic illustrations of that splendidly got-up work.

It is an inaccuracy, occurring on almost the first page of the volume before me, to rank the museum of the Capitol in Rome among those "containing monuments and remains of the early Christian ages." Some Christian epigraphs have lately been added to that gallery, and several others referring to the Christian emperors have long been placed there; but the fine art contents of the Capitoline sculpture gallery are exclusively classic and Pagan.

With regard to some of this author's statements and inferences I venture to differ from him.

Among Christian emblems the dove is mentioned in these pages as that of "Christian charity and peace." Rather, I believe, are those right who agree with the generally received explanation that doves (as also other birds of the gentle and lovely species) symbolize the freed and beatified soul—and are therefore so frequently introduced in sepulchral paintings or incised beside epitaphs on Christian tombs. An object sometimes seen in the paintings of the ancient cemeteries (or catacombs), the milk-pail, either in the hands of the Good Shepherd, or placed by itself upon a kind of altar or rock, with two sheep beside it, is more than "probably"—*certainly* (as I believe) to be understood as representing the Holy Eucharist.

The picture in the cemetery of S. Callixtus, in which we see a man of venerable aspect seated, with scroll in his hands, and a woman drawing water from a well, can hardly be meant (as here assumed) for "Christ and the woman of Samaria"—an explanation with which its grouping no way accords; and I may prefer the more satisfactory key to this mystical subject supplied by Northcote and Brownlow, who conclude that the male figure is some holy pastor, perhaps Pope Callixtus himself, and the woman an allegoric figure of the faithful drawing water from the well of life—the Truth of Evangelic Doctrine.

The head of the Saviour (finely characterized even in its present dim and imperfect state) on the ceiling of a chapel in the SS. Nereus and Achilleus cemetery seems to me of earlier date—the purity and simplicity of the conception being taken into account—than the "second half of the

fourth century." A still greater mistake is it, I believe, to assign to the "second half of the ninth century" the better preserved solemnly and benignly beautiful head of the Saviour in the cemetery of S. Pontianus. The contrast, remarkably manifest, between this finely conceived picture and the repulsively ascetic character of the mosaic compositions in Roman churches known to be of that date, the ninth century—a decline from higher models still more apparent in the second half of that century—is more than sufficient for the refutation of this theory. Comparing that head with the full-length figure of the Saviour in the finest Roman mosaic of the sixth century, at the SS. Cosmo and Damiano church on the Forum, we may be led to assign about the same date to both works—the mosaic and the fresco. I should alike claim earlier origin than the period of deep decline in art for the other memorable picture, the "Baptism of Christ," in the S. Pontianus cemetery; yet this also is assigned by Dr. Appell to the same period.

The date here assumed for the well-known Madonna picture in the S. Agnes cemetery—the eighth century—is questionable; but perhaps given only on authority which our author does not stop to question. From that picture the nimbus is absent; yet the holy monogram is placed on both sides of the Virgin Mother's head. Remembering the decrees of the Council of Ephesus, A.D. 431, and its formal decision that the title *θεοτόκος* should be bestowed on Mary, may we not suppose that this picture, one of the earliest known in which the Mother and Divine Child are presented as a devotional, not historical group, pertained to the numerous class of those produced and in demand, kept (it is known) in houses and churches as a token and symbol of orthodoxy soon after the dispersal of that Eastern Council? The figure of the blessed Mother would certainly have the nimbus in an eighth century painting; for that accessory appears, common to all saintly heads, from the century previous.

Differing even from such an authority as Aringhi (here cited) with respect to a group among the interesting reliefs in the sarcophagus of Junius Bassus, prefect of Rome (*ob.* 359) in the crypt below S. Peter's, I conclude that the subject is not "S. Peter's Denial of the Saviour," but the arrest of that apostle, who is here seen standing between two Jews; and in this, as in the many other presentments of the same subject in early Christian art, I believe the intention is to prefigure or symbolize the persecutions awaiting the Church—not (at least not evidently) from any such starting point, in the artist's conception, as the hierarchic supremacy of that apostle.

The account of the "S. Januarius Catacombs" at Naples, the last section of this volume, seems to me the most interesting, and the part which best meets a demand hitherto unsatisfied—at least by any work in our language. Having visited and explored to the fullest extent then possible those Neapolitan hypogaea, first in the year 1870, next in 1872, I came back into daylight from their far-extending corridors and oratories impressed with a sense of the value and significance of the art-works, epigraphs, &c., contained in them, and with increased surprise at the comparative neglect in which they have hitherto been left. A full report of works carried out in them within recent years is supplied by De Rossi in a *fasciculus* of his *Bullettino* of Christian archaeology (*Anno II.*, second series, No. 1).

Among the paintings seen in these hypogaea which Dr. Appell fails not to appreciate some are admirable, others quaint and curious. None seem to be of the very highest antiquity within this range of illustrations left by the early Church. Nothing leads us to infer the state of persecution as that of the Neapolitan Christianity, for whose

worship and sepulture these retreats have served. The most important epigraphs (there are some in Greek among the many in Latin) have been transferred to the National Museum. I find no mention in these pages of two painted figures beside a tomb, which struck me as among the best, in half-lengths, of S. Peter and S. Paul, the holy monogram under one, three small crosses above the other head, and between them a half-length of the lady here interred with the epitaph *Bitutia in pace*. Another, a life-size figure of a young man holding a cross (probably a deacon), is like a pleasing and faithful portrait, this being without any inscribed name. A lately discovered hall in these subterranean retreats has the appearance of having been used for Pagan interment, if not for worship—its paintings of a gaily decorative, no distinctly religious character.

In taking leave of Dr. Appell's work I can earnestly recommend it as a manual suited to awaken intelligent interest in the aggregate of monuments here considered, and to guide, whilst suggesting method for, the pursuit of careful studies directed along certain paths within an ample and richly fertile field.

C. I. HEMANS.

#### ALBERT VON ZAHN.

THE death, on the 16th instant, of Albert von Zahn at Marienbad is announced. But thirty-seven years of age and of slender build, von Zahn gave promise of a long and useful life. His loss is deeply regretted, not only by those who were personally acquainted with him, but also by those who were aware of the position which he held amongst critics and historians of art. As keeper of the museum at Leipzig he distinguished himself by contributions to periodical literature and an essay on Dürer's relation to the art of the Renaissance. His work on ornament was deservedly successful. Promoted to the office of keeper at Weimar, he superintended the transfer of the treasures of art in that duchy to the new museum, and wrote an interesting paper on the drawing of Fra Bartolommeo in the Grand Ducal archives. Promoted again in 1870 to the office of keeper of the royal collections at Dresden, he introduced a new and more liberal spirit into the administration of the gallery; and we owe it to him that a series of photographs has been made directly from the masterpieces of the Dresden Museum which equals, if it does not surpass, anything of the kind that has yet been done elsewhere. He was an indefatigable workman, editor of the *Jahrbücher für Kunstwissenschaft*, to which he contributed valuable articles, editor of Burckhardt's *Cicerone*, which has been translated and published in England. It will be remembered as a proof of his manliness and frankness that, after holding a decided opinion as to the originality of the Madonna assigned to Holbein in the Dresden Museum, he went over to the other side when that picture was confronted with its Darmstadt rival.

Born in Saxony, and connected by feeling as well as by position with the court of his native country, he refused in 1872 an offer made to him to take an appointment as privy councillor attached to the department of art in the ministry of public worship at Berlin. His place at Dresden will be filled up with very great difficulty.

J. A. CROWE.

#### NOTES ON ART.

The American papers state that the site is already chosen for the great International Exhibition at Philadelphia which is to astonish the world in 1876. The largest building ever yet devoted to a similar purpose will, say the journalists, be erected upon it. As it is feared that the custom-house duties may prevent many persons from exhibiting it has been resolved that no tax shall be levied on articles intended for exhibition unless they are sold in America.

The School of Art at Geneva established in 1869 in order to raise artistic taste as applied to the manufactures of the country has adopted a new and we should think a most encouraging mode of rewarding its most successful pupils. All those namely who have so distinguished themselves as to earn a

prize during the past year are to be sent under the conduct of one of the professors to visit the exhibition at Lyons and all the museums and collections of that town that may be of interest or advantage to them.

Such art tours as this can scarcely fail to be of great benefit to the youthful student by making him acquainted with other art manufactures besides those of his own country and school. We recommend this Geneva mode of award to the authorities at South Kensington.

A catalogue has been recently published in Paris of the engraved and lithographed works of R. P. Bonington, one of our English artists who strange to say has met with more appreciation in France than in England. The editor, M. Aglais Bouvenne, has done his work very thoroughly, and it is only to be wished that he had at the same time described and catalogued the painted works of this charming artist. A portrait of Bonington engraved by Delauney and the facsimile of a letter addressed by the painter in 1825 to his friend M. Colin increase the value of the little volume.

*La Fédération Artistique* is the title of a new artistic journal that has recently appeared in Brussels. M. Gustave Lagye seems to be one of the principal contributors. It is published every Thursday, and the subscription is 15 fr. for the year, so that it is considerably cheaper than the older Belgian journal *Le Beffroi*.

It is announced that the jury of the *Salon* of 1873 have awarded first class medals to MM. Louis Félix Merson and Luc-Olivier Merson for painting, to MM. André Allar and Jean Baptiste Baujault for sculpture, to MM. Édouard Corroyer and Louis Ernest Lheureux for architecture, and to M. Adrien Didier for engraving.

The *Chronique des Arts* reports a curious case that has recently been tried in Paris. A certain M. Aldema had given the late artist Adrien Dauzats a commission for four pictures the subjects of which were to be taken from the "Arabian Nights." The price of each picture was fixed at 2,000 fr., that is to say 1,000 payable on the sketch and the other 1,000 on the reception of the finished picture. The first of the four pictures was begun by Dauzats, and he received according to agreement the 1,000 fr. for the sketch, which represented Sindbad the Sailor; but before the work could be finished the artist died, and his brother and heir when the sketch was demanded of him by M. Aldema, who generously offered to pay the additional 1,000, refused it on the ground that his respect for the memory of an artist did not permit of his selling one of his unfinished works. The Tribunal has however decided that the heir could not refuse to deliver a work already sold, and if the purchaser was content it was not for him to dispute the state to which the picture had advanced. Besides it was found that the picture had already been publicly exhibited since the death of the artist, so that the alleged ground of "respect" was to say the least of it open to suspicion.

The mediæval collection at the British Museum is not large, and seldom, we imagine, attracts the attention of visitors; nevertheless there are many objects of interest in it, especially several ivory carvings and other articles of early English workmanship. Among the latter is a small silver gilt casket or shrine that was acquired by the Museum from the Goodrich Court Collection formerly in the possession of the well-known antiquaries Ducarel and Douce. The shrine is richly engraved with the arms of Margaret, second wife of Edward I., and her step-daughter Isabella of France, the betrothed wife of Prince Edward, afterwards Edward II. It is supposed that it was given by the former to the latter between 1303, the date of the betrothal, and 1307, the date of the death of Edward I.

## Theology.

*Introduction to the Science of Religion*. By F. Max Müller, M.A. Longmans.

THE peculiar character of these lectures makes adequate criticism of them peculiarly difficult. There is discernible on every page the easy strength and graceful cunning of a hand that is a perfect master in its own craft. The felicities of expression and style and the lucidities of exposition that made the *Sanskrit Literature*, the *Lectures on Language*, and the *Chips* so pleasant to read, exercise their charm here. There is the same fine blending of scholarly and scientific accuracy with philosophic insight and poetic beauty of form. There is the same exuberance of fancy and abundance of illustrative matter, which often, indeed, becomes a superabundance, the illustration not unfrequently running away with author and reader alike and becoming a sort of Moses' rod to the argument. But while these *Lectures* interest they can hardly be said to satisfy, or realise one's idea of what an *Introduction to the Science of Religion* by Professor Max Müller ought to be. He has done so much to lead inquiry and stimulate thought on this and related subjects that the minds he has quickened and directed instinctively expect him to do much more. But there is no evidence in these *Lectures* that his mind has grown with the growth of his science, and is prepared to collect and develop into system the suggestive germs that he has from time to time thrown out. There is little here that can be called new, that Professor Müller had not said, often much better, elsewhere. The lectures, too, are fragmentary, even considered as being no more than they claim to be; discuss many questions about which one cares very little, hint at, rather than discuss, graver questions about which one cares a great deal. The science of religion, like every new science, or what claims to be one, raises many new issues and demands the re-discussion under altered relations of many old principles, and

it is rather tantalizing to see such points indicated only to be neatly passed by. Perhaps, however, the fault may lie not so much with Professor Müller as with our expectations, and he may think it well, having introduced us to the science, to leave us to master its ultimate principles and bearings for ourselves.

These *Lectures* are, like all that Professor Müller writes on questions touching theology, remarkable for their tact. His skill in the *μαενητική τέχνη* is so perfect that he has made the *μαενοίς* of his science almost painless to ancient prejudice. Had some other studies, which bear no harder on the old *Rechtgläubigkeit*, been as diplomatically introduced to English thought, there had been more of friendliness and mutual profit in the relations of critical scholarship and religion.

This volume is made up of four lectures on the Science of Religion, and two essays, one on False Analogies in Comparative Theology, another on the Philosophy of Mythology. In the lectures a great variety of subjects are either discussed or glanced at, from the beliefs of savages to the opinions of Mr. Matthew Arnold. The first lecture shows at once the possibility and difficulty of the science, states its divisions, defines its province and method, describes and illustrates the action of the tools with which it has to work. The second lecture sketches the materials that have to be mastered before the student of religion can proceed to construct its science, discusses and rejects various proposed classifications of the religions of mankind, such as the true and false, natural and revealed, national and individual, polytheistic, dualistic, and monotheistic. The third lecture starts with a preliminary discussion as to the relation of religion, nationality, and language, and then goes on to the author's own classification, which is the same as his classification of languages, for Asia and Europe, Turanian, Semitic, and Aryan, and argues that as we have proofs of an original unity of language in each of these families we have also proofs of an original unity of religion in each. The fourth lecture describes "the right spirit in which ancient religions ought to be studied and interpreted," and explains the author's theory as to how primitive man attained and expressed his idea of God, and how from this primitive faith the later religions were developed.

A categorical examination of these *Lectures* were needless, but a few salient points may be selected for notice.

Professor Müller holds a qualified degeneration theory as to the religions of man. The ancient African faith was much higher than the modern, and what of it has been preserved has a "not altogether faded reminiscence of a supreme God, the Father of the black as well as of the white man" (p. 119, cf. 165). Man started in his religious career from a comparatively high level. What his original faith was, how he reached and expressed it, and how it degenerated into a very material polytheism, are eloquently described (pp. 269 ff.). But there is nothing that can be called valid proof or sober argument advanced on behalf of this theory. There is no attempt to explain the facts or answer the speculations of Charles Darwin or Herbert Spencer, E. B. Tylor or Sir J. Lubbock. The discussion throughout is based on the author's peculiar linguistic and mythological doctrines, finds in them its illustrations, and is conducted in their interest. Now, I by no means undervalue or pronounce against these doctrines, but simply complain that so great a theory is raised on so narrow a basis, especially when the question has been so much debated of late and the other side has been so well defended and maintained by some of the greatest names in England. The question is fundamental, for as it is decided Professor Müller's theory as to the origin and growth of religion, not only in the Indo-European, but in the human, race will stand or fall.

But, again, there is the question as to the origin of our

religious ideas. It has two sides—a psychological and historical—the one falling under what Professor Müller terms theoretic theology, the other under comparative. The one inquires, Why did man begin to believe or worship? the other, What was the earliest form of the belief he held, or the worship he practised? The first question is in the lectures answered thus:—There is in man a "faculty which independent of, nay in spite of sense and reason, enables man to apprehend the Infinite under different names, and under varying disguises" (p. 17). Again, "there is clearly a place for a philosophical discipline that has to examine into the conditions of that faculty of man, co-ordinate with sense and reason, the faculty of perceiving the Infinite, which is at the root of all religions" (p. 18, see also p. 20). Now, it is strange that a phrase so vague as "faculty of apprehending the Infinite," with its action described in terms still more vague, should satisfy so great a master of language as Max Müller, and one, too, so deeply versed in German speculation from Kant to Hegel and Schelling, and therefore in the ambiguities of meaning and varieties of thought that can hide themselves in so large a phrase. Is it a simple or complex faculty? Is its action direct or indirect? does it reach its object by intuition or does it proceed by induction? To what extent and in what order does it call into exercise or stand rooted in the conscience, or the emotions, or the intellect, severally or collectively? In other words, does religion proceed from the dictates of the practical reason, a feeling of dependence, or an act of the intellect searching after a first and final cause? These points need to be defined to determine, not only how far and under what forms this faculty can be active in primitive as in civilized, in civilized as in primitive, man, but also what elements are necessary to constitute a religion, and what laws regulate its growth. The fears, dreams, and fancies out of which certain ethnologists derive religion may be the modes in which this faculty operates in the savage, while meditation or devotion may be its forms among civilized men. But what we need in order to understand the matter and bring it to an issue is, a psychological analysis and exposition of this "faculty of apprehending the Infinite."

The primitive religion which this faculty created is painted in very glowing colours. Man has a "feeling of incompleteness, of weakness, of dependence" which "we can as little explain as we can explain why the newborn child feels the craving of hunger and thirst." "He looks for a guide, for a friend; he wearies for some one on whom he can rest; he wants something like a father in heaven" (p. 270). So he wrestled with the idea of God within him "till he had conceived it, and brought it forth, and given it its name" (p. 273). "The brilliant sky was, no doubt, the most exalted, it was the only infinite and unchanging being that had received a name, and that could lend its name to that as yet unborn idea of the Infinite which disquieted the human mind" (p. 272). And so the name of the sky became the name of God. The man who first used it distinguished well enough between "the blue canopy above" and his God; "but when that name had to be used with the young and the aged, with silly children and doting grandmothers, it was impossible to preserve it from being misunderstood" (p. 273). The process downward is—the sky is regarded as the abode of God; then the double sense of the name forgotten, and "the visible canopy over our heads" implored and worshipped as God; and, lastly, "many things true of the visible sky would be told of its divine namesake," and so legends and mythology would arise. And so religion becomes "a sacred dialect of human speech" (p. 154), and its inevitable changes "the *dialectic growth and decay*, or if you like, *dialectic life of religion*" (p. 274).

Now, all this is very beautiful, but very unscientific and unreal. The "faculty of apprehending the Infinite" has become in the first place a faculty of creating myths. The process of creation and growth thus described, while admirably adapted to explain the rise and development of a solar mythology, is curiously insufficient to explain the evolution of the religious ideas embodied in the worship and politics of man. Religion is not so much made up of names as of acts; worship is as essential to it as speech. Man, too, is not quite so much the victim of language as this theory implies. If he had faculty enough to create names for objects of sense, he had as much as create names for those of thought. And as the need to find God and a name for Him came, according to Professor Müller, not so much from the perceptions of sense as the emotions or wants of the spirit, it seems certain that the subjective element would assert itself in the name even more than the objective. Then, the theory is of limited application, can, indeed, solve most of the riddles of Indo-European mythology, but is only in part applicable to the so-called Turanian religion of China, on the one hand, and totally inapplicable to the Semitic religions, on the other. In the one case, the process ceased before it was well begun; in the other, the Semitic mind framed for its deities names that show it had never passed through the experiences and stages Professor Müller describes, either as to the finding and naming of God, or as to the so identifying of Him and His attributes with physical objects as to generate a mythology. In short, the comparative theologian is here dominated by the Indo-European comparative philologist and mythologist, who errs simply by giving too wide an application to principles and methods which he has found of pre-eminent service within a narrower sphere of inquiry.

The classification of religions Professor Müller proposes is also open to criticism. It is the same as his classification of languages, and proceeds from his conception of the relation between language and religion. No doubt, it is within limits both correct and convenient. There is a genetic relationship, possibly between the several Turanian religions, certainly between those of the Semitic and Indo-European families respectively. There are, too, certain characteristics which distinguish the religions peculiar to the one family from those peculiar to the other. But, then, the great religions of the world cannot be so classified. Christianity can be described neither as a Semitic nor as an Aryan religion, because it contains elements which it owes to both races and to neither. Buddhism though Aryan in origin has long since passed over to men of another race, and Mahomedanism, though true on the whole to the Semitic spirit, owes much of its dominion to men of alien blood. The classification fails, too, at the other end of the scale, and, while leaving the religions of many savage peoples unclassified, either leaves isolated a worship so elaborate and cultured as that of ancient Egypt, or brings it into suspicious, not to say impossible, relationship with the rude Fetishisms of Africa (cf. 118-9, 164-6). Races so mix and religions with them, race religions become so universalized, that, while classification by race may be adopted provisionally, or while investigation remains at a given point, classification by character can alone be ultimately valid.

Of minor points and incidental allusions a few here and there are open to question. Such as the ingenious explanation of the story as to the creation of Eve from the rib of Adam (pp. 45-8), the religious character marriage has had from the very beginning of history (p. 153), and the relation between nationality and religion (pp. 145-52), which is expressed, perhaps, rather too absolutely. But it were needless to push criticism into details. Professor M. is often more

instructive and suggestive in his digressions than in his leading arguments, and there is no quality in him one admires more than his rare faculty of striking out unexpected parallels, and illuminating by a side light some obscure corner of an intricate and difficult subject. He has served, as perhaps no man now living in England has done, the cause of scientific philology, and has helped to create a new era for scientific theology. If the tendency to criticize is greater the spirit and capacity to admire are no less, than when he began to publish his theories as to language and his speculations as to the origin and growth of mythology and religion. And these few criticisms of his latest book cannot more appropriately close than with the hope, that, when next we meet him on the field he has so successfully cultivated and stimulated others to cultivate, it may be with a work entirely worthy of his great name.

A. M. FAIRBAIRN.

#### NOTICES OF NEW BOOKS.

**Heyse and Tischendorf's edition of the Vulgate version of the Old Testament, with readings of the Codex Amiatinus.**

"THE only MS. of the Latin translation of the Old Testament by Jerome which has not been corrupted, is at Florence, and a collation of it for me is being made by Dr. Heyse, which is to be completed by September 15." Thus wrote Bunsen to a friend in 1857 (*Life*, vol. ii., p. 431), and in 1873 this much needed work is given to the public. The text in the body of the page is taken from the Clementine edition of 1592 and that of Vercellone, variants of the Codex Amiatinus being placed at the foot, with occasional references to the readings of the Hebrew and the other ancient versions. Dr. Heyse being prevented by ill-health from seeing the latter part of the work through the press, this friendly office was undertaken by Professor von Tischendorf. Latinists and students of the Old Testament have at last a text of the translation of Jerome which can be used with some confidence for critical purposes. The only regret now left us is that the text of the Old Testament has not been given in full, as was so excellently done by von Tischendorf in the case of the New.

**Messe und Pascha.** Von Gustav Bickell. Mainz: Kirchheim.

DR. BICKELL, whose edition of the writings of S. Isaac of Antioch we mentioned in a recent number, has set himself in the present work to prove that the Roman liturgy of the Mass was in all essential points fixed and determined by Christ and the Apostles. He compares the liturgy of the Apostolic Constitutions with the corresponding Jewish ritual, and arrives at the conclusion that the former is derived from the Passion-service expanded and transformed by our Lord. Whatever be their opinion of this result, all students will appreciate the evidence so carefully brought together of Jewish influence on Christian forms and ceremonies.

**Le Concile de Nicée d'après les textes coptes.** Par E. Révillout. Paris: Lafitte.

AN extract with separate pagination from the February-March number of the *Journal Asiatique*. Gelasius long ago told us that the Acts of Nicaea consisted of three parts—1, the dogmatic, which contained the "symbol," the anathemas, &c.; 2, the disciplinary, summed up in the canons; and 3, the moral, which contained rules for leading the Christian life. M. E. Révillout has now demonstrated the accuracy of this statement. He has published two long fragments from MSS. in the Turin collection, one of which relates to the dogmatic part of the Nicene Acts, while the other contains gnomes, or maxims, written in an elevated, parallelistic style, and belonging apparently to the third of the divisions mentioned by Gelasius. Both frag-

ments are edited in the Coptic text with a French translation. They are said to have come from the convent at Alexandria known as "the place, or sanctuary, of St. John the Baptist."

*Ueber den Ursprung und den ältesten Gebrauch des Christen-namens.* Von Dr. R. A. Lipsius. Jena.

THIS is an academical programme presented by Dr. Lipsius in the name of the theological faculty of Jena to the venerable Dr. Hase, senior professor of the faculty, who celebrates this year the jubilee of his doctor's degree. The author's object is to show that the name *Christiani* originated among the heathen population of Asia Minor in one of the latter decades of the first century. It is possible that this took place as early as the close of the reign of Nero, though it may not have been till the destruction of Jerusalem and its temple, which put an end once for all to the original confusion between the followers of Christ and the professors of Judaism. The mention of the name of Christian in the Acts of the Apostles is shown, on this hypothesis, to involve an anachronism. It is true that it is first traceable in Asia Minor, and was possibly invented, as the writer in the Acts says, in Antioch, but its absence from the other books of the New Testament, except the first epistle of Peter (1 Peter iv. 16), which is of doubtful genuineness, shows that it was not in use as early as the time of S. Paul. This view is confirmed by an examination of the Jewish-Christian literature and the writings of the Apologists. The name first occurs in the works of Latin authors (Tac. *Ann.* xx. 44, Sueton. *Nero* 16, Plin. *Epp.* 96 and 97). Tacitus and Suetonius speak of it as in use at Rome in the reign of Nero, but this may possibly be an anachronism. Their evidence is beyond dispute only for their own period, *i.e.* from A.D. 116 to 120. The passages in Pliny show that there was as yet no settled judicial policy with reference to Christianity at the court of Rome. This circumstance, and the tendency of the Romans to confound Christianity with Judaism, are against the view that the appellation arose at Rome in the reign of Nero. The form of the word Christian points on the whole to Asia Minor. A Roman origin is not absolutely impossible, since the imperial rule was marked by a growing irregularity in the formation of names. To be good Latin, it should be *Christinus* or *Christanus*. But the probability is that *Christiani* belongs to that very large class of names in *ἡρώς, ανός, and ιανός*, which the grammarians describe as *τύπος Ἀσιανός*. It is remarkable that the only passage in the New Testament where the name occurs is in an epistle addressed to the strangers scattered in Pontus, Galatia, Cappadocia, Asia, and Bithynia, the very regions where, according to the official report of the proconsul of Bithynia, the delation of the Christians was in full bloom. In a note on p. 7 Dr. Lipsius retracts his assertion of the genuineness of the three letters of Ignatius in the Syriac text. He still maintains them to be older than the shorter Greek text, but denies that any part of the text in any recension can be the work of Ignatius of Antioch.

*A Comparative View of the Doctrines and Confessions of the various Communities of Christendom, with Illustrations from their original Standards.* By Dr. G. B. Winer. Edited from the last edition, with an Introduction, by Rev. W. B. Pope. Edinburgh: T. and T. Clark.

THE comparative study of confessions of faith forms a recognised branch of the theological curriculum in Germany, and, as Mr. Pope shows at length in his thoughtful though ultra-conservative introduction, is well deserving of more attention in England. The most conscientious and dispassionate guide to the subject is probably the handbook now translated. The author, as Mr. Pope well observes, "still stands alone in his three characteristics: first, that of exhibiting all the standards of the Christian world . . . secondly, that of

giving the very words of the standards themselves in apt juxtaposition, and thirdly, that of abstinence from polemical dissertation or harmonizing" (Introd. p. xxix). There are however some obvious objections to Winer's mode of treatment. It tends to confirm the student in the false belief that the history of dogma is a mass of dry unconnected details. It leaves out of sight the fact that heterogeneous elements often if not always co-exist in the same religion. And it ignores the capacity of assimilating new truths possessed by all healthy religious communities. It is true that Winer has made some slight provision for the study of the respective confessions in their entirety in the comparative tables placed in the appendix. Mr. Pope speaks of "the tact with which a multitude of harmonious and discordant elements are articulated into one homogeneous structure" (Introd. p. xxxix). But these tables merely suggest the existence of a hidden unity in the midst of diversities; they do not show how this unity is produced. If the student is to use them to any profit, he must enter the thorny region of controversy, which his guide so studiously avoids. He must give up the dream of the exclusive possession of religious truth, and learn to estimate his own and the other confessions on well-defined critical principles.

T. K. CHEYNE.

*Geschichte Jesu übersichtlich erzählt.* Von Dr. Theodor Keim. Zürich: Orell, Füssli und Co.

DR. KEIM has shown his astonishing activity by bringing out a popular or condensed edition of his larger History of Jesus. He has carried out this new task with characteristic thoroughness and vigour. The book has not been mechanically abridged, but re-written from beginning to end. On a somewhat cursory examination we do not find that the earlier positions of the writer have been materially altered. His views respecting the composition of the Synoptics, the Fourth Gospel, the details and development of the history, the date and circumstances of the Crucifixion, and the Resurrection remain very much as they were. Only on the first and last of these points Dr. Keim seems to be rather more conscious that his position is temporary and provisional. The elaborate preliminary chapters of the earlier book have been much curtailed, and the attention is concentrated rather more upon the dynasty of the Herods—for the history of which Dr. Keim is now acknowledged as the highest authority. The appearance of the work in a double form gives it a distinct advantage over all others of the kind; and we gladly admit that some of the objections brought in this journal to the original edition have now altogether lost their point.

W. SANDAY.

#### NOTES ON THE HEBREW TEXT OF THE PSALMS.

1. Ps. lxxv. 6 (5) *תִּבְטָח בְּקִרְבָּן יָם*  
*וְיִתְּנֶנּוּ לָהֶם יָם וְיָבֵשׁ*

The two last words are difficult. The translation of the authorized version—"and of them that are afar off upon the sea," is obviously incorrect. Some take *וְיִתְּנֶנּוּ* for a noun, for which there is no authority; others, assuming it to be here, as everywhere else, an adjective, connect it, not with *יָם* but with *יָבֵשׁ*, and translate, "The confidence of all the distant ends of the earth and sea," thus destroying the rhythm of the verse, and turning poetry into prose. The Syriac version suggests another mode of removing the difficulty, viz., the substitution of *יָם* for *יָבֵשׁ*. This would give,

*תִּבְטָח בְּקִרְבָּן יָם*  
*וְיִתְּנֶנּוּ לָהֶם יָם*

The confidence of all the ends of the earth,  
Of the nations afar.

וְיִרְדּוּק is found Joel iv. 8 (iii. 8). And the following passages may be compared, in which 'the nations' and 'the ends of the earth' are found in parallel clauses, viz., Ps. ii. 8; xxii. 28 (27); Is. xlix. 6; Jer. xvi. 19; xxv. 31.

2. Ps. lxix. 9 (8): כָּמוֹן דִּיחִי לְעַד  
וְנִכְרִי לְבָנֵי אִמִּי

כָּמוֹן is explained as a Hophal participle: but the root וִי is not elsewhere found either in Hiphil or Hophal. I think it, therefore, extremely probable that the original reading was כָּמוֹר. Compare Job xix. 15, and the numerous passages in which וִי and נִכְרִי are found in parallel clauses. The text would, then, stand thus:

כָּמוֹן וְ דִּיחִי לְעַד  
וְנִכְרִי לְבָנֵי אִמִּי

I am as a stranger to my brethren,  
An alien to my mother's sons.

3. There are several passages in which it is unquestionable that כָּמוֹן has been substituted for מִנְחָה, the two letters מ and נ, in some of the forms of the Semitic writing, being not unlike. Thus, in Ps. cxliii. 10, there can be little doubt that those MSS. are correct which read מִנְחָה בְּמִנְחָה מִשְׁדֹּר, "Thy good spirit will lead me in the path of uprightness," instead of the received text מִנְחָה בְּמִנְחָה מִשְׁדֹּר, "into the land of uprightness." Comp. Ps. xxvii. 11.

But this is not the only passage in which מִנְחָה appears where we should expect מִשְׁדֹּר.

(1) In Ps. lxvii. 5 (4), the present text is מִנְחָה בְּמִנְחָה מִשְׁדֹּר  
וְנִכְרִי לְבָנֵי אִמִּי

which is translated in the A. V., "For thou shalt judge the people righteously, and govern the nations upon earth." But מִנְחָה does not mean 'govern,' but 'guide' or 'lead' (as it is everywhere else rendered in the A. V.); and this at once points to the substitution of מִנְחָה for the meaningless מִשְׁדֹּר. The passage would then stand

כָּמוֹן בְּמִנְחָה מִשְׁדֹּר  
וְנִכְרִי לְבָנֵי אִמִּי

For thou wilt judge the peoples righteously,  
And guide the nations in the way.

Comp. Ps. xxv. 8, 9, "Therefore will he teach sinners in the way;" and Prov. xxiii. 19, "Hear thou, my son, and be wise, and guide thine heart in the way."

(2) Still less doubt is there that the same substitution should be made in Ps. cxvi. 9: מִנְחָה לְפָנֵי דִיחִי  
וְנִכְרִי לְבָנֵי אִמִּי

"I will walk before the Lord in the lands (not *land*, as in A. V.,) of the living." For this we should clearly read:

מִנְחָה לְפָנֵי דִיחִי  
וְנִכְרִי לְבָנֵי אִמִּי

"I will walk before the Lord in the paths of life." Comp. Ps. xvi. 11. Prov. x. 17; xv. 25.

4. Ps. lxxi. 7: כָּמוֹן דִּיחִי לְעַד  
וְנִכְרִי לְבָנֵי אִמִּי

I am as a wonder to many;  
But thou art my strong refuge.

What are we to understand by כָּמוֹן 'wonder,' in this connection? Some think the Psalmist describes himself as a marvel of divine grace, others, of divine judgment; but there is no evidence that the term, when applied to persons, is ever used in either sense. Compare Is. viii. 18; xx. 3; Ezek. xii. 6, 11; xxiv. 24, 27; Zach. iii. 8, the only passages in which it is so applied. Besides, and the present text, it is not easy to account for the insertion of the particle of comparison. Why כָּמוֹן, and not simply מִשְׁדֹּר? It is possible כָּמוֹן may have stood in the original text, and not מִשְׁדֹּר; this would well correspond with v. 20, "Thou . . . shalt quicken me again, and shalt bring me up again from the depths of the earth;" and is in some measure confirmed by comparison of Ps. xxxi. 13, 14 (12, 13), "I am forgotten, as a dead man (נִכְרִי) . . . I have heard the slander of many, fear on every side,

while they took counsel together against me, they devised to take away my life." So it may have been here:

כָּמוֹן דִּיחִי לְעַד  
וְנִכְרִי לְבָנֵי אִמִּי

I have been to many as one dead,  
But thou art my strong refuge.

DUNCAN H. WEIR.

## Contents of the Journals.

*Theologisches Literaturblatt* (Bonn).—The Nos. from February to June contain valuable articles on history, philosophy, and general literature, treated from a liberal Catholic point of view. Among the works of this class reviewed are Strauss' *The Old Faith and the New*, the same author's *Voltaire*, Crowe and Cavalcaselle's *History of Italian Painting*, the Letters of Frederic the Pious, Lotze's *Mikrokosmos*, and the Basel Chronicles. Works of Catholic theology receive their fair share of attention, though Protestant divinity is not altogether neglected. The last No. contains a short notice of vol. 2 of the *Speaker's Commentary*, which is however entirely descriptive. We doubt whether Dr. Reusch can be in earnest when he remarks that Bishop Hervey does not emend the text of the books of Samuel to the extent recommended by Wellhausen in his critical essay. The fact is that the Bishop regards the Masoretic text as on the whole sound, in spite of the manifold deviations of the Septuagint.

## Science.

On the Chlorophyll Colouring-Matters. [Zur Kenntniss der Chlorophyllfarbstoffe und ihrer Verwandten.] By Dr. Gregor Kraus. Stuttgart. 1872.

THE object of the author in writing this work was to draw the attention of his countrymen to the value of the spectrum microscope in studying certain branches of botany, and to illustrate its use by showing what may be learned by the investigation of the spectra of some of the coloured substances found in the leaves and flowers of plants. It appears that the instrument is very little known in Germany, and the author expresses his regret that it has not yet been appreciated out of England. Having described the Sorby-Browning spectrum eye-piece and other instruments used, and, as I think, very truly pointed out the importance of having a very bright spectrum, without great dispersion, he proceeds to the consideration of the colouring-matters of plants. One great value of the work consists in the very complete account of the observations of previous experimenters, many of which however are of very little more than historical interest; since the methods employed were usually very unsuitable, and the materials used so impure that the results cannot be referred with confidence to any one particular substance. The description of the spectra of

the different colouring-matters, and the lithographed illustrations, are in my opinion very good and accurate; but I am compelled to differ from the author in many of the conclusions at which he has arrived.

In studying this subject I have been more and more convinced of the importance of distinguishing the various constituents of complicated mixtures, and my own knowledge has to a great extent advanced in the same proportion as I have been able to discover methods which could be employed with advantage in deciding whether a coloured solution was or was not of compound nature, and in determining the character of the different constituents. I have therefore paid very particular attention to this question, and have been led to a somewhat peculiar use of bisulphide of carbon, alcohol, and water, in various proportions, in order to separate the constituents more or less perfectly, and also to the employment of what I have named *photochemical analysis*, being the use of light as a re-agent to decompose some of the coloured constituents and leave others, when it is difficult, or even impossible, to separate them by chemical methods. Anyone who has not tried them would scarcely believe what can be done by the use of such simple means. The application of these methods, and the comparison of the coloured constituents of all the leading classes of plants, especially those of fungi, lichens, and algae, growing in various conditions, have led me to find that there is a considerable number of what may be called fundamental colouring-matters, which are absent or occur in very different proportions in different kinds of plants, and also in the same kind, when growing in different circumstances, besides a still larger number of apparently unessential coloured substances, which may be present or absent without materially interfering with the healthy growth of the plant. I have given a general account of these researches in a paper recently read at the Royal Society, on "Comparative Vegetable Chromatology," and need not describe them now; but the results derived from these methods lead me to differ from the author in some important and fundamental particulars. In some cases preparations which he looks upon as different substances are in my opinion the same, only in one instance mixed with one, and in another instance with another colouring-matter, whilst in other cases he attributes certain variable spectra to the same single substance, modified by some unknown, and, as I believe, altogether imaginary, cause, whereas it can easily be shown that all these variations are due to variable mixtures of substances well known in an approximately pure state, having perfectly definite and constant properties. For example, he describes and figures the spectra of the blue-green colouring-matters from *Deutzia scabra*, and from *Oscillatoria*, and shows that they differ in constant and important particulars. He hence concludes that they are two distinct substances without any simple and definite connexion, whereas by employing the methods I have alluded to it may be most conclusively proved that what I have called blue chlorophyll is the principal constituent of both, but that it is mixed in the one case with a substance found in all green leaves, though not in *Oscillatoria*, and in the other case with another, occurring in large quantity in *Oscillatoria* grown in bright light, though in relatively very small quantity in green leaves, and even in *Oscillatoria* when grown in a very shady place. It is chiefly in the case of the colouring-matters belonging to what I have called the xanthophyll group that the author attributes the variation in the spectra to some unknown cause, and I look upon it as very important to be able to show that this variation is simply due to a variable mixture of two or more substances, for it would lead to loose and inaccurate observations if we were to

suppose that the optical characters of any separate compound could vary when dissolved in the same liquid. On the contrary, now that it can be shown by various methods that the solutions giving these variable spectra are mixtures of substances that can often be separated, and that the results can be easily imitated by artificial mixtures, there is no kind of reason for supposing that in like circumstances the optical characters of any of the separate constituents are variable. Not only is it important to establish this fact, but by distinguishing the different constituents, and determining their relative quantity in different cases, we have a perfectly simple and intelligible method of comparison, which otherwise would not be the case. The value of such principles in studying comparative vegetable chromatology will be seen at once, since it enables us to understand the exact connexion and difference between the coloured constituents of different classes of plants. With such exceptions as these, which are to be attributed in great measure to the application of new methods of research, I must express my high opinion of the merits of the work, and I trust that its publication will be the means of leading to the more complete and accurate study of a branch of research which will probably yield most valuable results; only, as I believe, these will be derived, not from the discovery of rare and exceptional colouring-matters, but from the careful and accurate qualitative and comparative quantitative analysis of complicated mixtures of the most common and fundamental, which may not have attractive properties, but yet probably play an important part in the economy of particular classes of plants. When we thus study the subject, and do not ignore what might be looked upon as insignificant details, it seems possible to draw a number of important conclusions, and to examine some of the most fundamental questions of biology from a new and independent point of view.

H. C. SORBY.

### Notes on Scientific Work.

#### Geology.

**The Ancient Glaciers of the Sierras.**—Prof. Le Conte, after having lived for four or five weeks in camp on the Sierras of California, has published a description (*Amer. Jour. of Science and Art*, No. 29, 1873, p. 325) of the existing evidences of former extensive glacial action in that region. The district examined comprises the Yosemite or Merced, Tuolumne, Lake, and American River valleys; and Bloody and Carson cañons, with their tributaries. In all distinct traces of glacial scoring and polishing are visible though much obliterated in many places by the disintegration of the coarser and more friable granite rocks; numerous moraines were likewise recognized. The lower part of Little Yosemite Valley is strewn with erratics of a coarse porphyritic granite, the felspar crystals of which are often four or five inches in length, and stand out from the weathered surfaces so as to resemble a coarse conglomerate or breccia. These were traced up Felspar Valley to their parent rock the Cathedral Peak and other similar peaks in the vicinity. In the upper part of the track of the Tenaya, one of the tributaries of the Yosemite glacier, which emerged from the Cathedral Peak, acres of glaciated surfaces are to be found of so smooth a surface that it is difficult to ride over them; rock basins are also abundant. Owing to the porphyritic character of the granite, the faces present the appearance of polished brecciated marble. Above Lake Tenaya appears a mass of granite 800 feet in height and more than half a mile long, polished on every side as well as over its top, where it is rounded like the carapace of a tortoise. The Tuolumne glacier from its source in Mt. Lyell to the mouth of Hetchy-hetchy Valley must have been at least forty miles in length, and have had many tributaries, all of which met above Soda Springs. Near this point and in the track of the glacier, stand two masses of rock from 500 to 800 feet high, which are smoothed and rounded on every side and on the summit, being perfect examples of *moutonnée* forms on a large scale. The main branch of this great glacier still exists, not as a true glacier, but as a mass of snow and névé, still it exhibits differential motion and has a well marked terminal moraine, about twenty feet high, fifty feet wide at the base, and about one mile long. The movement was determined by driving stakes along a line across the snow; when examined after forty-six days they had moved as follows:—No. 1, 11 in.; No. 2, 18 in.;

No. 3, 34 in.; and No. 4, which was near the middle, 47 in. The frozen mass occupies a sheltered cove in the vast amphitheatre formed by Mt. Lyell (13,300 feet high), Mt. McClure and other unnamed peaks, and is about one mile in length and half a mile wide. Among the highest peaks of the Sierras are many more similar remnants of the ancient glaciers. Bloody Cañon exhibits admirable examples of the two kinds of glacial lakes, those contained in rock basins scooped out by glacial erosion, and those accumulated behind terminal moraines; the latter graduate insensibly into marshes and meadows at the lower levels. From the top of Mt. Dana more than fifty of these lakes and marshes can be counted. The scorings in Carson Cañon are those of a glacier fifteen miles long and three to four miles wide, which descended in a southerly direction along Hope Valley and then turned at nearly right angles into the Carson Cañon. Prof. Le Conte believes that the deep narrow cañons of the Sierras have been "sawn out" by the action of glaciers, and that the coarse "perpendicular cleavage" structure of some of the granite has determined "the peculiar verticality of the walls." He points out that the erosion in this region has been enormous, for in addition to the whole thickness of the slates which, as is shown by various still existing patches, must once have covered the whole of the granite, there is reason to believe that several thousand feet of granite have also been removed. The highest peaks are composed of slate, the higher valleys of granite; lower down, the Cathedral and other peaks and ridges are of very coarse felspathic granite. The erosion here has been through at least 2,000 feet down to the harder and more siliceous granite. Still lower, about Yosemite, only this harder granite exists, the slate and the softer granite having been entirely removed.

**The Silurian Formation on the Dniester.**—In a letter to Prof. Geinitz (*Neues Jahrb. für Min.*, 1873, Part 2, p. 169) F. Schmidt gives the results of an examination of the fossils and their *gisement* in the Silurian which occurs on the banks of the Dniester in Podolia and Galicia, undertaken at the request of the Imperial Mineralogical Society of St. Petersburg. He finds the beds identical with those of the Ludlow group in Oesel and Gothland, and regards them as a continuation of Baltic Silurian. In Podolia, in the vicinity of Kamenetz, the prevailing rock is coral limestone which encloses *Strematopora*, *Heliolites*, and *Labechia conferta*, as well as *Euomphalus alatus*, *Lucina prisca*, and *Pentamerus galeatus*, all being characteristic species. This is accompanied by thin-bedded calc-marl, both underlying a clay-bed containing no fossils. The deposits in Galicia are characterized by thin beds of lime-stone interlaminated with slaty clay and abounding in *Tentaculites ornatus* and *tenuis*, and *Leperditia baltica*; *Orthonota rotunda* and *Pterinea retroflexa* are likewise present. Individual shields of *Pteraspis* are not rare. The lower division of the Upper Silurian is but sparsely developed on the Dniester, only two localities being known which can with certainty be identified with the Wenlock group. They are, the grey marl near Studenitz and Kitaigorod in Podolia, bearing the characteristic Wenlock shells *Spirifer radiatus*, *Orthis elegantula*, *Leptaena transversalis* and others; and a greenish-grey marl which extends from Mot-Biskupje to Borscow in the Niklaw valley, which contains, in addition to the foregoing, *Orthis hybrida*, *Strophomena pecten* and *filosa* and a few new forms.

### Physiology.

**Physiology of the Brain.**—At the recent congress of German naturalists at Berlin M. Flechsig gave an account of some investigations he had made on the development of the white substance of the central nervous system of the human brain. The observations of M. Flechsig were made on foetuses varying in age from 4½ months to 5, 6, and 7 months, on one foetus of 7½ months, on one which had only lived one day, and on others which had lived for some time. He finds that the process of development in the brain follows a definite type for a different period both of intra and of extra uterine life. Certain well defined tracts turn white whilst others retain their grey colour. Extra uterine life exerts a powerful influence on the development of the white substance of the brain which before birth possesses only a whitish colour. The optic thalami do not become white until the third day after birth. The phenomena thus presented are identical on both sides of the brain.

**New Mode of Estimating the Absolute Quantity of Blood contained in the Body.**—It has long been known that in the process of bleeding to death, though several vessels may have been simultaneously opened, a relatively large proportion of blood remains in the smaller vessels of various organs. Welcker proposed to estimate this quantity by washing out the vessels thoroughly with pure water, and comparing the colour of the washings with certain standard test-solutions previously prepared by the dilution of known quantities of blood with definite quantities of water. This plan has been adopted by Heidenhain, Bischoff, Panum, Gescheidlen, Ranke, and Spiegelberg. Brozeit has recently made use of another method suggested by v. Wittich; he obtains the Haematin from a definite quantity of the blood by means of ether and hydrochloric acid, and this constitutes a standard. The quantity obtained from a measured quantity of the washing is then

ascertained, and the amount of blood in the washings is then easily ascertained. Steinberg having noticed that some difficulty exists in estimating the fine shades of colour in Welcker's colorimetric method, dilutes a definite quantity of the natural blood of the animal till a green colour appears in the spectrum. The washings are diluted till the same band is developed and data are thus obtained for the calculation of the amount of blood contained in the washings. Carrying out this plan Steinberg finds that the total quantity of blood in the rabbit is  $\frac{1}{10}$  to  $\frac{1}{15}$  of the weight of its body. In the guinea-pig the weight of the blood to that of the entire body is as 1:12.0—12.3; in an adult dog as 1:11.2—12.5; in a puppy as 1:16.2—17.8; in an adult cat as 1:10.4—11.9; in a kitten as 1:17.3—18.4; and in an adult fasting cat as 1:17.8.

**The Source of the Urea of the Animal Body.**—In the *Zeitschrift für Biologie* Dr. O. Schultzen and M. Nencki discuss the question of the probable nature of the secondary compounds which immediately precede the production of urea in the animal economy (see also the *Academy*, iii., 331). It has long been known that albuminous substances, if acted on by acids or alkalis or by the pancreatic juice, yield leucine, tyrosine glycocholl, &c. Dr. Schultzen and M. Nencki hold that these are the preliminary stages of urea. To reduce it however as far as practicable to certainty they diminished the food of a small dog till a minimum of urea was eliminated. Then on certain days a definite quantity of one or other of the above substances was administered, and the amount of urea eliminated on this and the following days was carefully estimated by the method of Bunsen. It was found that acetamide caused very slight increase in the amount of urea. Ten grammes of glycocholl caused an increase of nine grammes of urea; leucine acted like glycocholl; tyrosine on the other hand caused no material increase, but was found both in the faeces and urine. The authors conclude that the amido-acids form the urea, but not by a simple process of disintegration, since in one molecule of urea there are two atoms of nitrogen, while in one atom of amido-acid there is but one atom of that element. They believe that albuminous substances split up into amido-acids and non-azotised compounds. The amido-acids form urea and the non-azotised bodies undergo further oxidation into carbonic acid and water.

### Botany.

**The Gonidia of Lichens.**—In the *Annales des Sciences Naturelles* (Botanique), vol. 17, M. E. Bornet records a series of observations on the gonidia of lichens, made on species belonging to sixty different genera. The conclusion to which his examination has led the writer is that the relations of the hypha to the gonidia of lichens are of such a nature that they exclude the possibility of one of these organs being produced from the other; the theory of parasitism being the only one which can give a satisfactory explanation of these relations. He believes that in every known instance the gonidia of lichens can be produced upon a species of alga.

**The winter propagation of Duckweed.**—In the *American Naturalist* for May, Prof. T. D. Biscoe gives an interesting account, illustrated by drawings, of microscopic work undertaken with a view of testing the mode by which the minute white "winter fronds" of *Lemna pteryrrhaea* develop into the well-known green summer flowering and rooting fronds. He finds that the rudiments of both leaf-buds and roots are to be detected, by careful dissection, in the apparently dead winter fronds.

**The Fertilisation of Cereals.**—Mr. A. S. Wilson contributes to the *Gardeners' Chronicle* of May 24th some additional notes on this important and much controverted subject, differing in some respects from those already recorded. He agrees with Delpino in believing that insects have no share in the fertilisation of cereals, and, like that observer, does not think it correct to maintain that the wind is the agent in the same sense that this is asserted of dioecious plants. The essential agency is probably the sudden extension of the filaments causing a few grains of pollen to be emptied out of the anthers before they are entirely ejected from the flower. In the case of rye this extension of the filaments takes place with extraordinary rapidity. Before flowering the filaments will be found to measure about  $\frac{1}{16}$  of an inch in length; in the course of five minutes or less from the instant the pales begin to open the filaments will, in many cases, have extended to  $\frac{1}{16}$  of an inch, the whole of the pollen having fallen out, with the exception of a few grains which probably cause the fertilisation. Mr. Wilson questions the accuracy of Hildebrand's statement (see *Academy*, vol. iv. p. 94) that the majority of the flowers of barley never open, at all events in Scotland; as also another statement by the same writer that the flowers of the oat do not open in wet weather. Although clouds of pollen may be seen passing over a field of wheat, rye, barley, or oats on a windy day, Mr. Wilson does not consider it by any means proved that cross-fertilisation takes place in this manner.

**Development of the Ovule and Fertilisation in Primulaceae.**—Prof. P. M. Duncan read a very important paper on this subject at the meeting of the Linnean Society held June 19th. He controverts the published views of Duchartre that the "free central" placenta of Primulaceae is formed perfectly free within the cavity of the ovary and never at any time has any connection with the ovarian wall, and finds

on the contrary that the placenta and ovarian wall separate from one another by a process of differentiation. The ovules are of very simple structure, consisting of nothing but a single integument covering the embryo-sac; there is no inner integument and no nucleus. The lower part of the style consists of dense tissue absolutely impermeable to the pollen-tubes; and even if these were able to enter the ovary in this way they would be quite unable to reach the micropyle of the ovule, from its close contiguity to the placenta. Prof. Duncan has traced the course of the pollen-tubes from the base of the style through the loose tissue of the placenta itself, from which they emerge in the immediate neighbourhood of the micropyles of the ovules, which they then enter.

### History.

The Early History of the Property of Married Women, as collected from Roman and Hindoo Law. A Lecture delivered at Birmingham by Sir H. S. Maine, March 25th, 1873.

IN this lecture (which is reprinted for the Married Women's Property Committee) Sir H. Maine sketches the gradual emancipation of women, and shows that it formed part of the larger process by which the children, and in fact all parts of the family, have been gradually set free from the despotic power of the eldest male of the eldest ascending line, to whom the patriarchal family was absolutely subject. In Roman law the wife ultimately acquired full rights over her own property, but the Brahminical lawyers succeeded in checking the process of emancipation after it had proceeded some way in the same direction as at Rome; and there is but too much reason to believe that, as a childless widow in Bengal enjoyed her husband's property for her life, the custom of widow burning was introduced as a religious duty to get rid of her and her rights, and hence the anxiety of her family that the rite shall be performed, which seemed so striking to the first English observers of the practice—a practice which has no warrant whatever in the oldest monuments of Hindoo law and religion. In all this Sir H. Maine is only condensing what is already known, though he takes a larger view of the subject than is common; but he concludes with a most interesting sketch of the consequences of Augustus' law compelling opulent parents to create portions (*dotes*) for their marriageable daughters. The Christian Church, which strove to maintain the beneficent Roman law, tried to secure for the wife a provision of which the husband could not wantonly deprive her, and which would remain to her after his death, and hence the promise of the husband in the Marriage Service, "with all my worldly goods I thee endow," a formula which at first sight is puzzling. Hence the very strong feeling in France in favour of *dotation*, or portioning of daughters. Hence too the admirable contrivance in the Code Napoleon of having, so to speak, model settlements set forth ready-made in the law, which may be adopted or not at pleasure, and if adopted require only a few words on paper—whereas an English marriage settlement of any sort is cumbrous enough. We have only just obtained a partial improvement by the Married Women's Property Act. We would point too to the admirably clear account of the way in which the rule of distributing an inheritance *per stirpes* instead of *per capita*, shows that a given system of law has undergone development. We are glad to

hear that the lecture is to form part of a forthcoming work by the eminent author.

We would draw attention to Laveleye's article in the *Revue des deux Mondes* for June 1, on the Swiss "Allmends," that is, the property held in common by the villagers and other small bodies, by a custom of law which has been handed down from those primitive times which Sir H. Maine describes in his *Village Communities*. Laveleye strongly urges the political importance of the system as tending to prevent the frightful struggle between the richer and poorer classes which seems to threaten modern society. The detailed account of the mode of using the common woodlands, pastures, and commons is most valuable. C. W. BOASE.

*Fasti Monastici Ævi Saxonici.* By Walter de Gray Birch. (Published under the direction of the Royal Society of Literature.) Trübner and Co.

A COMPLETE index of the persons mentioned in Kemble's *Codex Diplomaticus* and other similar collections has long been a desideratum. Mr. Birch has partially supplied the want by compiling a comprehensive list of the heads of religious houses in England and Wales during the Saxon period, and promises further lists at a future time. He has of course made full use of Dugdale's *Monasticon*, Hardy's *Fasti*, and other works—ten in all; and has prefixed a chronological list of 300 religious houses established in England and Wales previous to the Norman Conquest. Mr. Birch had prepared the way for his work by a valuable monograph on the succession of the Abbots of Malmesbury, and we are also indebted to him for a detailed account of the life and writings of William of Malmesbury himself. It is obvious that it is only by means of such carefully prepared lists that we can gradually attain greater accuracy in dating the early charters, as the lists of witnesses (bishops and abbots always forming a large proportion of them) are often our best means of fixing the date. The same lists help us in detecting the numerous forged charters, as people are often made to sign as witnesses who were dead some time before or were not contemporaries at all. Of course too every improvement in dating the names accurately in one charter helps us as to the relative chronological position of others, and gives us firmer standing ground for our early history. We hope Mr. Birch will be able to still further add to and improve his list, and would suggest that some more names and dates may be got from the various monastic chronicles, which sometimes give things wanting in Dugdale, as even the last edition of the *Monasticon* is executed in a very unequal manner. Something too may be got from Boniface's and Alcuin's Letters, and others in Jaffé's *Monumenta*, e.g. Guthbert, abbot of Wearmouth and Jarrow 767 x 781 in Jaffé 3, p. 289-90 and 300; Eaba of Malmesbury 3, 300; 3, 97 gives the date 735 for Duda; 3, 166 supplies Sigebald of Chertsey 732 x 746; 3, 31 perhaps gives an abess Sigegyth before 705. It would be convenient to have the Latin names of the monasteries added; and a few more identifications, e.g. Nursling = Nutshalling between Winchester and Southampton. How much correction is needed in the common lists William of Malmesbury's inaccurate account of Glastonbury sufficiently shows. In p. 28 Mr. Birch suggests Newminster as the place where the old Saxon calendar printed by Hampson originated. It has been already suggested in our columns that it was formed at Malmesbury. We understand that Mr. Birch is about to print this calendar together with other matter, and give a fuller list of the obits entered on it than Hampson's space allowed him to do. We trust his new publication will soon enable us to report his final conclusions on the subject.

C. W. BOASE.

### Notes and Intelligence.

Dr. Adolf Schwarz' pamphlet on the History of the Jewish Calendar is a work of real value to chronologists. The author has, first of all, carefully sifted the writings of Slonimsky, Pineles, and other Jewish scholars, without neglecting the chronological works of Ideler and others. Subjects which have been studied for a generation by such eminent men can hardly be expected to yield a large harvest to new-comers. The author has perhaps given too much attention to the astronomical calculations in his last part, while the history and especially the Biblical period is insufficiently treated. We should rather have expected a mention of the Assyrian calendar, and perhaps also of the Samaritan system of the Jubilees.

A compilation which will be found exceedingly useful by all students of mediæval history has just issued from the press at Ratisbon. Its title is *Series Episcoporum Ecclesiae Catholicae*, ed. P. Pius Bonifacius Gams, O.S.B. The book professes to include all the bishops of the Western Church from the earliest times down to the date of publication. This design seems to have been carried out very fairly. As was to be anticipated the bishops of the English Church and the (so-called) Jansenist Church of the Netherlands are not included, but from the Roman point of view the catalogue seems to be very complete. At the end of each table a list of authorities is given. In many instances these lists are very complete, and for the German dioceses especially are of great use in directing the student to books which otherwise he might never have heard of.

An important omission has been made with regard to some of the ancient dioceses. No sign is given to indicate the point at which vague church tradition ends and history based on record evidence begins. It is no doubt important that the whole muster-roll should be given in each case, but we ought to know on every occasion whether faith or reason be the faculty that has guided the compiler.

We would draw attention to the 26th volume of the *Histoire Littéraire de la France* (period of the fourteenth century). In it Paulin Paris completes his account of the early French *chansons de geste*, and endeavours to trace the connection between the successive poems and poets. Hauréau analyses the extant volumes of early sermons preached at Paris during this period. The mixture of French words and sentences with the Latin is very curious, and the familiar, not to say gross, tone of some of the preaching friars remarkable. Legends and anecdotes are introduced everywhere: one preacher tells how when he was a child he was afraid to pass through the "Septem viis" (a sort of "Seven Dials") because of the sort of people who lived there. A collection of ready-made sermons occurs—"Sermones parati, Dormi secure"—a significant title. The most important of the shorter notices concerns Pierre du Bois, the audacious writer in the time of Philip the Fair, with whom commences the series of legists who gave such powerful help to the crown in its struggle with the Church and the feudal nobles. We doubt the statement, p. 461, about Pierre de Limoges' library: "sex viginti" can hardly mean "126 volumes;" surely "26" is the proper interpretation, though classical Latin would have preferred "sex et viginti."

### Contents of the Journals.

*Revue Archéologique*, Jan.-May, 1873, contains several series of articles on the excavations at Rome and in Cyprus; and the Abbé Cochet continues his account of recent finds in Normandy, especially in the old cemetery of S. Ouen at Rouen, where the lowest layers of tombs go back to early Christian times. E. Miller describes the inscriptions he has found in Thasos and other Greek islands, and adds a fragment of Appian's Roman History (on Arab divination). Böckh's great collection only contains six inscriptions from Thasos, we now possess more than two hundred. Two new inscriptions also come from Skyros. A good account is given (with plates) of the frescoes in the underground church of S. Clement at Rome, some of which are later than was at first supposed. Heuzey contributes notes on ancient Macedonia (Deuriopos and the course of the Erigon), and Rayet some late documents from Patmos, and E. Miller some Greek poems by Theodorus Prodrumus in the time of Manuel Comnenus (the essential requisite in these verses is to have an accent on the last syllable but one). Perrot begins an interesting history of ancient art in Asia Minor. Lastly, Michel Bréal writes an essay on the place which comparative grammar ought to hold in classical education. There are many interesting short articles—one of importance on the bronze age, with an approximation to a date for it, and a denial that in South Europe it can be separated from the age of iron. Some Celtic notes may be commended to our scholars.

*Literarisches Centralblatt*, May 24, describes Böhm's important catalogue of the MSS. in the Austrian Record Office, and criticises Palacky's *Urkundliche Beiträge zur Geschichte des Hussitenkrieges*, vol. i. (1419-28) and Sohm's *Die altdenke Reich's u. berichts-verfassung*. A very full comment follows on Beames' *Comparative Grammar of the modern Aryan Languages of India*.—May 31 supplies some remarks on verses contained in the new volume of Mommsen's *Corpus Inscript-*

*tionum*, on Lange's *Roman Antiquities*, vol. iii., and on Krebs' book about Christian of Anhalt, the adviser of the Elector Palatine in the Bohemian war.—June 7 criticises Nitsch's book on the early Roman annalists, and describes the Brescian lawyer Albertano's *Liber Consolationis et Consilii*, which though a French adaptation became the source of Chaucer's "Tale of Melibe." Fournier's *Le théâtre français avant la renaissance 1450-1550* is praised, and Grimm's translation of Vasari's *Life of Raphael* reviewed a little less unfavourably than has been done in other journals.

In connection with the early French romances mentioned above as analysed in the *H. L. de la France* we would notice Suchier's *Ueber die Quelle Ulrichs von dem Türlin und die älteste gestalt der prise d'Orange*. The story of William of Orange forms a subcycle in the Legend of Charlemagne, and the poems on it are of great beauty and interest. We may refer to Ludlow's excellent analysis in his *Popular Epics of the Middle Ages*, which ought to be more generally known. The introductory poem to the well-known German form of the legend in Wolfram's "Willehalm" was written by Ulrich von dem Türlin, a Carinthian poet in King Ottocar's time, and Ulrich dedicated it to Ottocar somewhere between 1261 and 1275, perhaps about 1270. By an analysis of the MSS. Suchier shows that in its original form the introduction was written in sets of thirty-one verses, a rhymed triplet marking the close of each set. The whole poem consisted of 310 such sets. Türlin adopted the merest outline of the story from Wolfram, and filled it up from his own imaginative stores; for there were many ways in which it might be told how William took Orange and married fair Orable the Saracen queen, and fought the great battle of Arleschans (the plains of Arles). In Victor Hugo's *Légende des Siècles* will be found a vivid modern version of the early part of the legend. Türlin's "Willehalm" has come down to us in five recensions, which shows the popularity of the story and of the poet; in its original form it contains 9,610 verses (310 × 31). It is followed in the Heidelberg MS. by Ulrich's other poem, "The Knighting of Vivian," written in sets of thirty verses, without the concluding triplet. The popularity of the story in England is shown by Ordericus Vitalis' statement that a clerk named Gerold at the court of William the Conqueror sang of "the holy athlete William, who after a long knighthood renounced the world, and under the monastic rule gloriously did knight's service to the Lord." Ordericus says too "vulgo canitur a jocularioribus de illo cantilena."

*Bullettino dell' Istituto*, March, contains a notice of the prehistoric tombs and walls of Corniculum (on one of the three peaked hills N.E. of Rome), and a review of Kiepert "On the Topography of Ancient Alexandria"—to which is appended an account of the Vatican MS. of Zeineddin's "Account of Alexandria and Antioch," which appears to rest simply on Edrisi's well-known book.—May, explains the Etruscan word *Malavisch* by the Latin *mollis*, which was originally *molvis*, the *ll* being (as in other words) an assimilation of *lv*, and the form *mollusca* occurs in Plautus.—De Rossi gives an inscription relating to an "arbitrix emboliarum," i.e. apparently an *impresaria* of ballet girls; her name Theoro Bathylliana seems to refer to the rival pantomimic schools of Bathyllus (Mecenas' freedman) and Pylades.—Some tombs at Corneto are described, one of which has an admirable painting of a hunting scene; the inscriptions lately found at Rome and at Formiae are printed, and a notice follows of Friedländer's new edition of his monograph on the letters CONOB on coins, in which he refutes the objections to the old interpretation of the letters OB, viz., that they are the Greek numeral letters for 72, Constantine having ordained that a pound of gold should be coined into 72 solidi.

*Altpreussische Monatschrift (and Provinzialblätter)*, April-May.—Hipler contributes a notice of the Biographers of Copernicus, and Töppen an account of the Marienwerder low lands on the Vistula, the embanking of which was due to the Teutonic order of knights.—A review of Emmer's *Regesta diplomatica necnon epistolaria Bohemiae et Moraviae*, vol. i. and ii. (1253-72), points out the valuable references to the history of Prussia, since Ottocar of Bohemia twice led a crusade against the heathen people there in support of the Teutonic knights. Helm reports that the funeral urns found in Prussia are really of clay, and not, as some think, composed of ashes and blood.—Perlach publishes five letters of the Minorites in the North German towns, 1276-82—one of them refers to the Great Fire at Lubeck in 1276.

### Philology.

On Numerals as Signs of Primeval Unity among Mankind. By Robert Ellis, B.D. Trübner & Co. 1873.

MR. ELLIS has shown praiseworthy diligence in collecting and comparing the numerals of all the languages and dialects of the world, known and unknown. But his success is not equally satisfactory. The object of his work is to prove the primeval unity of mankind by pointing out the fundamental identity of the numerals throughout the globe, and their common origin from words which mean "finger" and "finger-finger" or "hand." The human race is supposed to have spread from the Paropamisus; the inhabitants of S. Africa, Australasia, and N. Asia and Europe having started first, and including at least two other rings of later emigrants.

The method by which these results are gained is simple enough. The numerals are assumed to be derived from words which signified "finger," "hand," "foot," and the like, either separately or in composition with one another. Any resemblance between these in two languages, however remotely separated, is taken to be a proof of a common origin; and as great laxity is allowed in the equivalence of letters, while it is considered indifferent for the purposes of comparison what numerals or parts of the body may be denoted, it is not difficult to discover resemblances and co-incidences all over the world. The number of different phonetic sounds employed in language is, after all, but limited; and when we find the English *white* grouped with the Lesgi *tsa*, "fire," the Esthonian *ku*, "moon," the Bornu *bul*, "white," the Hebrew *dseph*, "silver," and the Basque *gorri*, "red," it is plain that we have to deal with an elastic principle by means of which anything may be made out of

anything. Mr. Ellis has revived the art of making the vowels count for nothing and the consonants for very little.

If there is anything which comparative philology lays down clearly, it is that in comparing languages we must set aside all apparent coincidences in the vocabulary. The only legitimate sign of relationship between two dialects is likeness of grammar, structure, and phonology. When a connection has once been established by means of these, we may proceed to compare the lexicons. Nothing is more illusory than chance resemblances between words, with whose history we are unacquainted. What, for instance, can be more like at first sight than the North American *potōmac*, "river," and the Greek *ποταμός*, or more unlike than *wig* and *pilus*; and yet we know that the words are related in the second case, whereas *ποταμός* comes from a root *πά*, "to drink," while *potōmac* is a polysynthetic compound. The canon ought never to be forgotten that we may compare roots but not derivatives. Mr. Ellis, however, is not even satisfied with bringing together words of similar sound and meaning: provided the letters may interchange in some family of speech—Aryan, Semitic, or Altaic—or the vocables may represent in one idiom what is assumed to be the origin of a like-sounding numeral in another totally unconnected language, their relationship is regarded as indubitable. Where other means fail, the numerals are arbitrarily divided into what are supposed to be their component elements; the Sanskrit *chatur*, "four," for example, is resolved into 2+2 in the masculine and 1+3 in the feminine. But it is in this part of the subject especially that the consequences of neglecting to trace the history of a word are most evident. It is always dangerous to manipulate the vocabulary of a language with which we are unacquainted, and a slight knowledge of Basque phonology would have taught Mr. Ellis that the *r* in *bederatsi*, "nine" (1—10) and *zortzi*, "eight" (2—10) is euphonic as in the genitive and dative sing. of the article and personal pronouns. So, too, *hamar*, "ten," has nothing to do with the African *omo-ka*, "finger," but must with Schott be referred to the same source as the Mordvinian *kämen*.

It will be seen from this that those who believe in the aboriginal diversity of the various races of mankind have little to fear from Mr. Ellis's researches. Indeed, were his conclusions founded on ever so firm a basis they would still be insufficient to support his main thesis. Linguistic and physical unity are not convertible terms; and those who confound them together show that they have yet to learn the first principles of a scientific philology. A. H. SAYCE.

**Mélanges Philologiques.** Par Wilhelm Naumann. 1. Prononciation du C Latin. Paris: Sandoz et Fischbacher.

M. NAUMANN is determined to present the Romans of the classical period, will they nill they, with a sibilant *c* before *e* and *i*. What is the exact sibilant which this letter represented to them is, he admits (p. 79), hard to determine amid the variations exhibited by the Romance languages; and he therefore thinks that the best practical solution of the matter will be that every nation should pronounce its Latin *c*, and indeed its Latin in general, in its own fashion. This every nation has a perfect right to do; but, according to M. Naumann, *c* before *e* and *i* never was pronounced like *k*: never, and by no class in Rome. "Il n'y a pas une classe de la société romaine qui eût accueilli une telle mutilation de l'harmonie originale, et cela pour aucun autre but que pour complaire aux chimères d'une certaine coterie savante dont on détestait toujours à Rome hautement l'influence et les théories." For this conclusion, which may be surprising to some scholars, reasons thick as blackberries are forthcoming through M. Naumann's eighty pages. It has indeed been

urged by scholars who vaunt a seeming erudition that in the age of classical Latin the Greeks transcribed the Latin *c*, before whatever vowel it occurred, by *κ*: and conversely that the Latin *c* represented the Greek *κ* under all circumstances; but then the Greeks, nay Plautus himself, called the Romans *βαρβαροι*; and what does this imply but that the Greeks were destitute of linguistic sense? The Greeks, the captors of their conquerors, could never learn their conquerors' language. There was an "abyss" between the two nations, created by the "almost impossibility" which existed for a Greek to pronounce Latin with correctness. The hungry Greekling was an accomplished being, but there was one thing which he lacked, at least in the first century A.D.: for his successors four centuries later improved in this matter, and managed to represent the sibilant *c* by a more expressive combination than a mere *κ*. And if it be asked why the Romans represented a Greek *κ* by *c*, the answer is plain: they had given up their own *k*. Why they gave it up is indeed at first sight hard to see: perhaps the following vowel was sufficient to mark the character of the preceding consonant. As for the Goths, with their *lukarna* for *lucerna*, *akeits* for *acetum*, &c., they were writing in Greek characters: and besides, there was no *c* sibilant in Gothic, because in Gothic *haims* answers to the Latin *civis*. But indeed, if Gothic is to be our guide, why should we not adopt Gothic forms in the lump? And if Celtic words, taken from the Latin, represent the Latin *c* by a *c* (hard) at the beginning of a word, and a *g* (hard) in the middle, this shows that the Latin *c* had a variable pronunciation.

Another argument advanced in favour of the pseudo-science which would attribute to the Romans a guttural *c* before *e* and *i* has been that there is no hint in any Roman grammarian, or in Varro, or in Quintilian, of any difference in the pronunciation of *c* determined by the following vowel. This argument gives M. Naumann as little trouble as that from transcriptions. Swift justly complains of the absence in Homer of all mention of a save-all, and cannot away with the unsatisfactory character of his long dissertation upon tea. With equal justice M. Naumann finds, in the silence of the grammarians on a point which must have obtruded itself upon their notice, an additional proof of their incompetence. Varro was a bad hand at etymology: of what weight then can the authority of a Roman grammarian be on a point of pronunciation? Probably his attention was concentrated on smaller points: on the nature and right use of the aspirate, or, if so be, on the difference between Greek *φ* and Roman *f*: problems far easier of solution and clear explanation than the difference between a guttural and sibilant *c*.

Everywhere, indeed, in Latin and out of it, are found traces of a "certain assibilation" of *c* before *e* and *i*. The French found a soft *c* in Latin when the Romans came to Gaul: it existed in the Messapian dialect, nor was the Umbrian without it. The Oscan *k* and *g*, apparently so much against us, were perhaps due to Greek influence. Then there are Sanskrit and Lithuanian and Slavonic, giving us sibilants as the etymological equivalents for Greek *κ* and Latin *c*: what indeed can be plainer than that the Latin *c* represents the Sanskrit *ś*, and that where Latin turned this into a guttural before *a*, *o*, and *u*, the conversion was due to the force "d'une énergie intrinsèque"? There is also the Greek *σσ* = *κ* and *δδ* ("comparaisons bien vagues, il est vrai, bien rapidement jetées ici") and other etymological and grammatical facts. The author's conclusion, in short (to be serious for a moment), is taken for granted throughout; and it is a pity that he should have taken the trouble of supporting it by arguments such as those of which we have endeavoured to give a fair specimen. H. NETTLESHIP.

ON THE LANGUAGE OF LOOKS, EXPRESSION BY MIEN,  
GESTURES, AND MODULATIONS.

To the Editor of the ACADEMY.

A recent invitation to lecture before an anthropological society reminded me of a train of thought on the above subject which perhaps might repay fuller development than I am at present or may hereafter be able to give it. It may be of use to sketch briefly the line of ideas which I should have proposed to follow out, either in case I should be able to return to the subject at a future time, or to direct to it the attention of fellow students inclined to pursue the same inquiry.

It is usual to understand by the word language nothing but articulate speech, and to overlook the fact that this is always more or less—and chiefly when it aims at being most forcible—accompanied by the accessories referred to in the above heading; that these accessories sometimes even serve as a substitute for speech, and that it is possible to communicate perceptions, sentiments, feelings, thoughts, and intentions by their use without any assistance from articulate words. Three of these accessories—looks, play of feature, and modulation of voice—seem to agree in all nations; the fourth, gestures, does so at least in part, so that they form the *connecting* element in the reciprocal interchange of ideas between the whole of mankind, in complete contrast to articulate language, which makes itself felt as an element of *division* separating mankind into nations. These accessories of speech seem accordingly to deserve more attention than has hitherto been paid to them, and this on several grounds:

1. In themselves, as essential and very important utterances of the human soul, which require to have their whole extent apprehended in order that if possible their deeper causes may be comprehended.
2. In order to ascertain what utterances of this kind are common to all or many nations, which are peculiar to a few, and wherein they differ from each other, that we may be in a position to determine what part of them belongs to humanity in general, and what is restricted to special aggregations of men hanging naturally together; what rests upon universal laws, and what upon convention.
3. Because they make the purely human origin of articulate speech more easily intelligible; for we certainly must credit them with the capacity of assigning to any sound or combination of sounds the meaning which the first man who joined together these articulations and their accessories was impelled or intended to express by them.
4. Because they are in like manner calculated to explain many phenomena in the development of articulate speech, or at least to make them intelligible and conceivable. It is, for instance, an undeniable fact that families of nations belonging to the same race have developed families of languages which from a philological point of view are perfectly irreconcilable. Thus the Indo-Germans are reckoned, on physical and psychical grounds, as forming one—the so called *curly-haired*—race, which also includes the Semito-Hamites, Basques, and Caucasian tribes, and even the Dravidians of East Asia and the Nubians of Africa. These national groups have within historical times formed groups of languages that philology can neither connect with the Indo-Germanic group nor with each other. This fact becomes intelligible if we may assume that, at the time when the ancestors of these national groups separated themselves from the common root or base of the whole race, these accessories of articulate speech were so far predominant over the articulate speech itself that articulate sounds and sound combinations were used only in a few cases with a connotative value assigned to them, or if the practice of giving a value to them had already reached a considerable development, the value was so little assured by habit that after separation other sounds and sound-combinations might take their place by association with the same accessories.

With respect to the significance of these accessories of, or even substitutes for, articulate speech, it is to be desired:

1. That travellers should pay great attention to everything that seems to bear in any way upon the subject and describe their observations as exactly as possible.
2. That authors engaged in compiling grammars of living languages, instead of limiting their attention to immediate practical acquirements,

should allow themselves to be guided by the thought that it is the business of a scientific grammar to characterize and describe as accurately as possible all the means of which a language makes use in order to attain to complete understanding of the communications exchanged in living intercourse. An exact description of the above mentioned accessories of articulate speech might certainly be begun with living languages, and completed by degrees. It would give to the grammars of the latter a value as compared with those of the dead languages which could never be surpassed, hardly indeed equalled in, importance by the deeper insight which these give us into the construction and development of articulate speech.

THEODOR BENFEY.

THE CHALDEAN ACCOUNT OF THE DELUGE.

To the Editor of the ACADEMY.

SIR,—In my article on the Chaldean account of the Deluge in the *Academy* for April 15th I noticed the geographical difficulty which alone seemed to stand in the way of our identifying the Tam-zi of the story with Anu or Susru. Nizir, where the Babylonian ark rested, lay eastward of Assyria; whereas Guti or Kutu, which is called "the fortress (*gisgal*) of Anu," has generally been supposed to be the country between Syria and the Euphrates. I now find, however, that this is not the case. In W. A. I., ii. 51, i. 21, Nizir is called a country of Guti or Gutium, and this fixes the situation of the latter to the north-east of Babylonia, besides removing the geographical discrepancy already mentioned. We may thus understand how Sargon is able to place Gutium between the Hittites on the north-west and Media on the east.

A. H. SAYCE.

June 19th, 1873.

Transactions of the Society of Biblical Archaeology. Vol. I.  
London: Longmans. 1872.

IT is a great step in the right direction that a society should be formed in England for the systematic illustration of the Bible from a purely archaeological point of view. Theologians as well as Orientalists are under deep obligations to Dr. Birch and Mr. Joseph Bonomi, who in November, 1870, conceived the idea of its institution. And it is highly gratifying to find that so respectable a portion of the general public has responded to the appeal for funds. The tranquillizing, liberalizing effect of such a society as this will, we trust, be perceptible in the gradual diminution of those ungenerous suspicions which now harass the investigators of Biblical antiquities.

We have now before us, completed, the handsome and well-printed first volume of the Transactions of the society. It is therefore not inopportune to inquire how far the promises of the founders have been redeemed and their anticipations realized. A society supported by such eminent names as the present, and so firmly rooted in public estimation, can afford to dispense with flattery, and court an unbiassed criticism. In the first place theological neutrality has been strictly maintained—a condition of primary importance for its well-being which deserves to be pressed on the attention of both writers and speakers at the meetings of the society. Secondly, the scope of the institution has been interpreted with praiseworthy liberality, as is shown by the admission of such apparently remote subjects as the Cypriote inscriptions and the hieroglyphic tablet of Alexander described by Dr. Birch. Thirdly, its scientific character has been adequately though far from universally maintained. It would be useless to judge the Transactions of so mixed a body by too severe a standard of scholarship. We must be thankful if only a few of them are distinguished, either by the publication of fresh material, or by a criticism of facts new or old based throughout on definite principles. There are, it seems to me, but few papers in this volume which satisfy a high standard of criticism, few which are not to some extent injured, from a scholar's perhaps too partial point of view, by a regard for the "general reader," or by want of sound method and sufficient width of knowledge. Even such learned and really gifted writers as M. Chabas, Mr. Fox Talbot, and Mr. Cull will probably be thought to fail in one or both of these particulars. But every one, I think, will agree with me that the papers of most permanent value are those of Mr. G. Smith on the early history of Babylonia, of Mr. G. Smith and Dr. Birch on the Cypriote inscriptions, of Mr. Sayce on the origin of early Semitic civilization, and of Dr. Eisenlohr on the so-called Harris Papyrus.

I. Mr. George Smith gives extracts from the inscriptions of sixty-eight Babylonian kings. The chronology is uncertain till the reign of Kara-indas (cir. B.C. 1475), whose affairs are referred to in the Synchronon History of Assyria and Babylonia (W. A. I. ii. 65). The catalogue ends with Kin-zim, who was finally put down by Tiglath-Pileser in 727. We learn (p. 42) that *abda* in the famous *abda Martu* (an appellation of Kudur-mabuk, identified by Rawlinson with Chedor-

laomer) is a lithographic error for *adda*, king or lord, as well as father. On page 46 we have a story about Sargon I. which singularly resembles that of Moses, just as we have an Egyptian parallel to the story of Joseph in Potiphar's house, a Buddhistic to that of Solomon's judgment, and several in various mythologies to those of Samson and Jonah. Mr. Fox Talbot (p. 272) also compares the Sargon-story with that of Romulus. On page 48 it is shown that the title "king of the four races" referred not to Mesopotamia, nor to the four quarters of the world, but to the four states of Syria; cf. Gen. x. 23. On page 53 Mr. Smith retracts two of his conjectures in *Academy*, vol. ii., p. 507. On page 89 a translation is given of a fragment relating to the Deluge which if M. Lenormant is correct (*Le Déluge*, p. 19) corresponds to a portion of the legend lately translated by Mr. Smith. Yet the versions do not at all coincide.

II. Mr. G. Smith has also the credit of having discovered forty of the fifty-one or fifty-four characters of the Cypriote alphabet or syllabary, as well as several names, and the personal pronoun *anuku*. The first clue was derived from a mutilated bilingual inscription found at Daly (Idalium) by Mr. Lang, British Consul at Larnaca. Mr. Smith would have made further progress had his knowledge of Greek been equal to his talent for deciphering.

III. Dr. Birch's paper on the same subject is fuller and more interesting. It is clear that "the general structure of the language, and many if not most of the words are Hellenic," yet "there is, no doubt, a foreign element extensively mixed with it, either a Pelasgic dialect, or else that of an aboriginal population, to which must be added words that may have been introduced by Phœnician settlers or foreign conquerors." Dr. Birch gives the transliteration and translation of the Cypriote portion of the bilingual inscription, as well as of an inscription on a bronze plate also found at Daly. The date of the former is supposed to be about B.C. 370, that of the latter about 353.

IV. Mr. Sayce's paper is perhaps the one most suggestive of new ideas. After some trenchant remarks on the difficulties attending comparative Semitic philology, he points 1. to the sub-Semitic dialects of Africa as throwing light on the obscurities of Semitic grammar, owing to their descent from a more primitive stage of Semitic speech, 2. to the inscriptions and papyri of Arabia, Egypt, &c., as exhibiting the development of the different cognate dialects, and above all 3. to the cuneiform inscriptions, which have proved that "a thick substratum of Turanian civilization underlay Semitism in Western Asia" (p. 298). The receptive nature of the Semites has shown itself in the largely foreign character of their Pantheon, their science, and vocabulary. The Semitic traditions are equally Turanian in their origin. This part of the essay is too slightly worked out to be quite convincing, yet it is clear that there is much evidence in favour of the doctrine inculcated. I am certain of one point, that the parallels copied sedulously from one commentary into another between "Genesis and the Zendavesta" will not for the most part stand examination. But I still question whether any single key is sufficient to unlock the recesses of this cabinet of secrets. Then as to the vocabulary, Mr. Sayce thinks that "most of the so-called biliteral roots, and words relating to civilized life, are taken from Turanian Babylonia" (p. 304). Thus *'ir*, city, is the Accadian *Uru*, which is translated by the Assyrian *du* = Heb. *dhel*, tent. "This takes us back to a time when the Semite nomade lived in tents, and had to derive his idea and name of 'city' from his Accadian neighbours." So again *gan* (in *gan-Eden*) is the Accadian *gun* or *gunu*, enclosure; *hêkal*, palace, temple, is the Accadian *'t-gal*, great house, as was already pointed out by M. Oppert. "Crown" is *ega* or *aga* in Accadian, *egu* or *agu* or *agagu* in Assyrian, and "the word in the primitive signification of 'circle' is known to the other Semitic tongues." I abstain reluctantly from further details on this really important subject. There is no doubt whatever in the mind of any candid student of Assyrian of the existence of such a linguistic relation as that here described; the question is whether Mr. Sayce has not pressed it to an extreme—whether the coincidences may not be sometimes accidental, and the Semite have had a greater degree of originality than is here supposed. *Adhuc sub judice lis est.*

V. Dr. Eisenlohr supposes that the great Harris Papyrus contains not only the history of the exploits of Ramses III., but also of the establishment of the Jewish religion by Moses and the subsequent emigration of the Jews out of Egypt. There are certain discrepancies, it is true, between the book of Exodus on the one hand, and Manetho and the papyrus on the other; but these may be surmounted by distinguishing between the political head of the revolution and the reformer of Egyptian religion, *i.e.* Moses. An article has already appeared on this subject in the *Academy*, vol. iv., p. 33. I need only add that the text is here given in full with a transliteration and interlinear translation, followed by a commentary.

T. K. CHEYNE.

### Notes and Intelligence.

The interest excited by the proceedings of the Biblical Archaeological Society has encouraged a number of leading Orientalists to prepare a series of translations of Assyrian and Egyptian texts for the benefit of historical students. The selection of the records will not be confined

to those bearing directly on the text of the Bible, but embrace the entire range of Egyptian and Assyrian literature. The first volume will be issued by Messrs. Bagster and Sons, at a price to bring it within the reach of all who are interested in such subjects. It is highly satisfactory to learn that Dr. Samuel Birch has undertaken the general arrangement of the materials.

Sir H. Rawlinson writes to the *Athenæum* that he has just received from Baghdad (we presume from Mr. G. Smith) a clay contract-tablet dated in the first year of Evil Merodach. This is the first documentary evidence for the name of this king, which is thus seen to denote "man or servant of Marduk" (*amûl* = *avil*). Sir Henry forgets to notice that the true etymology has already been proposed by Dr. Schrader in his recent work *Die Keilschriften und das A. T.* Indeed it can hardly be doubted that it has suggested itself independently to very many Assyrian scholars.

The May number of the *Revue Archéologique* contains a letter from M. Renan on the Inscription of Mesha, on which he has lately given a course of lectures at the Collège de France. M. Renan only indicates briefly those conjectures which he thinks have not yet been proposed by other scholars.

Messrs. Trübner & Co. have issued a prospectus of a new and "international" edition of Marsden's *Numismata Orientalia* to be published by subscription. They contemplate nothing less than a complete revision of the descriptive letterpress by the editor or editors who have established a claim to the confidence of scholars in each numismatic department. Besides the fifty-seven original plates, fresh illustrations will be incorporated from time to time in the form of woodcuts or special plates.

We have received information from Leipzig of the expected publication of a Neo-Syriac Dictionary with exact descriptions of the pronunciation and accentuation, as well as of the origin of loan-words. The Syriac portion of the manuscript, which belongs to Mr. Cobb, formerly missionary to the Nestorians, was composed by a Nestorian named Mushe of Geog Tapa (in Aderbijân); the meanings of words were added by another Nestorian, Benjamin of Taka, under the eye of Mr. Cobb. The work has been carefully edited with a view to publication by a member of the American mission born and bred in Urmia.

The Philological Society has just published the second annual address delivered by the president, Mr. A. J. Ellis. This interesting paper contains—besides the president's own five reports on *Phonology*, on the *Papers* read before the Philological Society in the three years ending 31st December, 1872, on *Basque* (in which he has received the invaluable assistance of Prince Louis Lucien Bonaparte), on the formation of an *English Dialect Society*, and on Prof. Max Müller's latest views of the *Philosophy of the Origin of Language*—six other reports, on *Hungarian* by A. J. Patterson, on *Sanskrit lexicons* by J. Muir, on *Sanskrit grammars* by Prof. Aufrecht, on *Greek* by J. Peile, of Christ's College, Cambridge, on *Latin* by Dr. W. Wagner, on *Early English* by F. J. Furnivall and the Rev. W. W. Skeat. English scholars will hardly fail to regret one omission: nothing is said of the attempt now in its third year of progress to alter our pronunciation of Latin. The experiment is perhaps a dubious one, but surely it deserves to be chronicled.

The authorities at Leiden intend to commemorate the three hundredth birthday of their university by publishing a chronological list of all the students who have matriculated there from 1575, the year of its foundation by William the Silent, down to the present time. We have seen some of the proof-sheets of the early pages of the book. It is evidently being produced with great care. To Englishmen, and perhaps still more to Scotchmen, it will have considerable interest, as many eminent men of both countries were educated there in the course of the seventeenth and eighteenth centuries.

The names will of course be taken verbatim from the register, and as they were inscribed therein by persons who had no knowledge of English the surnames of some of our countrymen have suffered no little distortion.

### Contents of the Journals.

The *Indian Antiquary*, ed. by Jas. Burgess. Bombay. Part XVI. April, 1873.—On the Dialect of the Palis; by G. H. Damant. [List of some eighty words used by the Palis, but not found in Bengali].—Abhinanda the Gauda; by G. Bühler. [Extracts from two works of that writer, the *Râmacharitra* and *Kâdambarikathâsâra*, of which MSS. have been discovered by Dr. Bühler, and which contain some important historical statements. It appears from them that Abhinanda belonged to a family of Gauda or Bengal Brahmins, and that his sixth ancestor, Sakti, emigrated to, and settled in, Dârabhisâra, then forming part of the kingdom of Kâshmir. Dr. B. however believes that the poet, whom he places about 830-850 A.D., did not himself live in Kashmir but in Bengal, as is indicated by his surname Gauda as well as by the name of the ancestor of his patron, *Dharmapâla*, who belongs to the Pâla dynasty of Gauda.] The Seven Pagodas; by Rev. M. Phillips. [Account of the rock-cut temples at Mavaliveram.]—On the Rules which govern Kanarese Poetry; by Capt. J. S. F. Mackenzie.—The Calendar of Tipû Sultân; by P. N. Pûrnaiya. ## General Literature.

*Studies of the Greek Poets.* By J. A. Symonds. Smith, Elder, & Co. 1873.

MORE than one of these very rich and musical essays have been noticed in the *Academy* at the time of their first appearance. It need not be said that they gain by being brought together, that for instance the essay on Pindar, with its admirable fulness and actuality, which keeps us close throughout to a single poet, whose characteristics are adequately and imaginatively presented in the concrete, finds its natural complement and preparation in the more abstract and theoretical treatment of the Greek lyric poets, where the tendencies and filiation of the chief schools are admirably laid down. It is always a gain too when a sincere and earnest writer, even when he is so clear as Mr. Symonds, explains exactly the purpose of his work. His principal object has been "to bring Greek literature home to the general reader, and to apply to the Greek poets the same sort of criticism as that which modern classics receive." He fears that "with this aim in view" he "may have been led into extravagances of style;" it is not an extravagance to say "Pindar combines the strong flight of the eagle, the irresistible force of the torrent, the richness of Greek wine, the majestic pageantry of Nature in one of her sublime moods;" but it is something like an extravagance to call this figurative eloquence "plain critical language," even when it comes after a cascade of yet more gorgeous similes about sunsets and thunderstorms and the Motettes of Mozart.

Unfortunately it is impossible to bring Greek literature home to the general reader unless the general reader can read Greek with ease enough for enjoyment: and we are almost inclined to regret that Mr. Symonds, who does not postulate this impossible condition, has kept his benevolent purpose before him with so much pertinacity. If he had been content to write for cultivated readers he might have carried the discussion further and have kept it on a higher level: as it is the didactic and æsthetic tendencies cross each other, and it cannot be said that they always reinforce each other. Essays like those on the *Anthology* and the *Satirists and Græmic Poets* give well selected information pleasantly, the quotations are relieved by well placed and well

chosen epithets; and we come now and then upon a good suggestion, e.g. that the pithy terseness of Archilochus and his "racy epigrams, in which the subject was set forth with exquisite point and without circumlocution, must have been an acceptable novelty to an audience" jaded with epics. But upon the whole they are idle reading: classical scholars would be better employed in re-reading the originals; those who are not classical scholars would be better employed on the literature of languages which they know or the history of periods they may hope to understand. It is difficult to imagine with what purpose, didactic or æsthetic, a learned and accomplished writer can sit down to treat the periods of Greek literature in thirty-six pages. Mr. Symonds escapes as well as could be expected; he skips from one summit to another without leaving out any or losing his balance: only he is rapid at the price of being breathless, and glowing at the price of being inflated. It is not pleasant to have to say such things of a writer who proves even in this unfortunate essay how well he ought always to write.

The essay on Empedocles is chiefly remarkable for a sort of opulent grandiosity of thought and diction that is highly appropriate to the subject. The essay on the Idyllists deserves higher praise; it is nothing but pure nectar; if it did not contain a single trustworthy statement or a single original idea it would still be worth reading for the warmth and grace and clearness of a style which the author's example encourages us to call fragrant and sunny. And the style is very far from being the chief merit of this brilliant and delightful essay: the questions which arise about the canon of Theocritus and his disciples are treated with a luminous tact which is almost a substitute for a solution. Moschus and Bion are characterised with a very rare combination of firmness and subtlety with sympathy, though the critic might have spoken more gently of the *Europa* if he had remembered that the "casket" of Moschus was the original of the "counterpane" of Catullus. A zealous Hellenist might even maintain that the Greek idyll is better arranged, though the Latin is a work of genius. But the chief value of the essay is in the lovely descriptions of Mediterranean coast scenery, and in the way in which the writer brings out Theocritus' sentiment for its beauties as shown partly in his epithets and still more in his natural use of the anthropomorphic symbolism by which the ancients were able to give concrete

shape to much sentiment which we can only express by language which if suggestive is vague and incoherent. The account of the myth of Acis and Galatea is especially good. The idyll on Hylas is made the text for some dainty and circumspect remarks upon the very delicate subject which Mr. Symonds by an euphemism which is not too misleading designates Greek chivalry.

The elementary contrasts between ancient and modern tragedy are treated with great depth and clearness in an essay that is perhaps remarkable rather for fulness of knowledge than for originality of suggestion; though there is a new and good remark, the remark that the practice upon which Horace founds his precept *Ne pueros coram populo Medea trucidet* was originally determined rather by mechanical than æsthetic considerations. Perhaps it is hypercritical to notice that the author has scarcely been enough upon his guard against leaving an impression that Greek tragedies were deliberately constructed out of the doctrines which Schlegel and others have traced in them. Mr. Symonds sometimes seems to write as if the art of Æschylus were as self-conscious as the art of Plato, and this is a most improbable assumption: the very limited and technical precepts of Lionardo da Vinci's treatise on painting show how late it may be before the most subtle artist realises the theory of his art. The final essay on the genius of Greek art is very beautiful, and brings out very clearly the value of *αυφροσύνη* as a substitute for what we are accustomed to call morality, and the selection of Walt Whitman of all men as the representative of the Greek spirit in our own day is a really luminous paradox. Perhaps it is a defect that Greek art is treated too much as an ideal unity without making sufficient allowance for the different tendencies of the different races which made up the Greek nation and the different periods of Greek national life. Mr. Symonds builds too much without qualification on the principle that sculpture was the typical Greek art: the Lesbian and Ionian lyristes lived before sculpture, which was created by Dorian gymnastic, and the Dorians, as he points out, had no indigenous poetry. In fact, though it is almost ungracious to say so, Mr. Symonds' benevolent fervour, though it never carries him beyond the limits of refinement in expression, tends to become a substitute for accuracy of thought.

G. A. SIMCOX.

**Monographs Personal and Social.** By Lord Houghton. John Murray. 1873.

It is not often that an author describes what he has aimed at and attained, so simply and felicitously as Lord Houghton has done in the following paragraph of the dedication of these monographs to Mr. Venables: "It seems to me that a truthful impression may be produced by a combination of general and personal observation, which, while it leaves the characters in the main to speak for themselves, aims at something like a literary unity of design. And when, as in the greater part of these notices, this interest is cemented by individual sympathy, there is a chance of the production of a more than transitory record." It does not affect the value of the impressions of an observer whose insight and opportunities are both above the average that he has not ever chosen to carry his analysis very far or to mar his finished sketches by a laborious completeness. Another less ideal reason for this incompleteness may be found in the fact that three at least of the Essays, those on Landor, on the Berrys, and on Sydney Smith, seem to have been planned as supplements to formal biographies, while that on Humboldt is *apropos* of his correspondence published by Varnhagen. Lord Houghton's method varies little: he sketches a character in outline; he brushes away controversies that have gathered

round such points as the alleged paganism of Heine, as the alleged indifference of Sydney Smith to a bishopric, as Miss Berry's chances of marrying Lord Orford, with a few words of easy authority. He seems to dislike discussion; in dealing for instance with such a subject as the works of Landor he searches for words of lofty and delicate homage to which Landor's title is incontestable, and is satisfied when he has found them. When he has measured the depth of the elder Miss Berry's melancholy and assured us of its genuineness, and brought out the contrast between inner sadness and outward prosperity, he does not ask whether her discontent was reasonable. He likes to rise at the end of a paper to consider some topic of general interest in the light of the character just described. Thus Colonel Selvis is an example of the blind disinterested devotion of officers of the Grand Army to France and the person of Napoleon: Humboldt at the Court of Berlin suggests the relation between men of thought and men of action: Sydney Smith suggests the contrast between Parsons then and Parsons now, where we are so apt to think without much reason that all the advantage is on the side of the present.

The chief interest of the paper on Cardinal Wiseman lies in the writer's perception of the irony of his career; it makes us feel what a misfortune it was to him from a secular point of view to be set to restore hierarchies and issue pastorals from the Flaminian gate. The paper on the last days of Heine is full of happy translations of well chosen poems, and contains the very touching reminiscences of a lady who consoled Heine at last after having been amused by him in his brilliant days at Boulogne. Of course the paper on Sydney Smith overflows with anecdote, though those which have appeared in Lady Holland's life are excluded. Here is an epigram manifestly prompted by his regret for a bishopric: "They now speak of the peculiar difficulties and restrictions of the Episcopal Office. I only read in Scripture of two inhibitions—boxing and polygamy."

The gems of the volume however are the social papers on the Berrys and Lady Ashburton. In the rest of the book we do not get beyond a pleasant acquaintanceship (and what an art it is to give us a pleasant acquaintanceship with a man like Landor); but we feel we know Miss Berry, with her pathetic consciousness of strength in excess of her opportunities hardening into something like cynicism; and though the treatment is at once more reserved and more intimate we almost know Lady Ashburton, whose impetuous gaiety and aristocratic frankness were indulged till they almost amounted to genius. The paper on Lady Ashburton includes a tribute to Charles Buller, with an account of two of his immortal squibs, one of which (the imaginary debate in the French Chamber on the Fancy Ball at St. James') Lord Houghton helped to concoct. Both will be often quoted, as well as the anecdote of Lady Ashburton's reconciliation with Thackeray. Perhaps the very delicate and suggestive appreciation of Lord Ashburton and his relation to his brilliant wife gives us a higher sense of the author's powers.

We shall look forward with great interest to Lord Houghton's political and literary monographs which are announced as in preparation: but we hope he will employ another corrector of the press—his present volume is very incorrectly printed.

G. A. SIMCOX.

#### LITERARY NOTES.

We have received a volume of *Essays und Studien*, by Dr. Hermann Ethé, consisting mainly of reprints from various German periodicals. About half the volume is devoted to critiques of decidedly second-rate modern German poets or

novelists, like Lappe, Lange (Philipp Galen), Adolph Böttger, and others, whose exact degree of literary merit the author believes to be slightly in excess of the comparative favour accorded them by the general run of readers and reviewers. It is obvious that studies of this class can only possess a limited kind of interest, and in some cases the reflection suggests itself that the critical balance might be most simply readjusted. Additional severity in judging popular favourites, instead of more scrupulous recognition of the small merits of authors who deserve popularity as little, but not less. In an article on the chief representatives of a very popular school of fiction, "the transatlantic exotic romance," there is a slight want of proportion in the writer's judgments, which are careful and conscientious to a fault, since he forgets how much contemporary fiction really falls below the minimum standard of literary intelligence which it is the business of the literary critic to apply; and it is curious to find a serious critic apparently still convinced of the veracity of Fennimore Cooper's delineations of the North American Indians. On the other hand, the merits of Böttger's verse, which are real as far as they go, and the intelligent, chivalrous sentimentalism of the unfortunate Maximilian of Mexico are well characterized; Julius Grosse deserves the space accorded him as a respectable lesser light in the literary firmament, and the appreciation of Richard Wagner as a dramatist is interesting because of its parallelism to the impression which his music itself makes upon those who are not his fanatical admirers and yet, unlike Dr. Ethé, do find music in his works. The rest of the volume is taken up with subjects more nearly akin to the author's special line of study, *i.e.* Persian and Oriental literature. There is a complete and readable account of the origin, fortunes, and doctrines of Babism, chiefly founded upon Gobineau, an original romance *The Maid of Bagdad*, which is half fairy tale, half study of Oriental scenery and sentiment, a class of work of which it is difficult to see the *raison d'être*, now that the poetical merit of genuine fairy tales is as generally appreciated as their literary and scientific importance. The article which should have been the most interesting in the volume, on the relationship between the legendary materials of Persia and the West, is rather desultory and inadequate. The author wastes a good deal of time in tracing parallels, with Shakespeare for instance, where the resemblance is either vague or accidental and quite independent of the skeleton of the legend. Dr. Ethé has not studied the subject of folklore or fairy-tales sufficiently to develop the special faculty which seizes the essential kernel of a myth and compares that, and that alone, with the parallel traditions of other lands. Those who have not read either the German or the French translation of the *Shah-nâmeh* will be interested by his extracts from that mine of legendary romance; but as he promises in his preface a "kritisch gesichtete und erschöpfende Darstellung" of the matter in hand, we are entitled to complain that he tells us nothing more than lies on the surface respecting the history in Persia of the *märchenhaft* element of Firdusi's great work. In 50 pp. it would, of course, have been impossible to give a comparative account of all the features common to the Persian epics and the nursery tales of most countries of Europe, but a Persian scholar might, we should have thought, have done something towards tracing the history of the legendary matter accepted purely as legend. Dr. Ethé compares the episode of Sal and Rudabeh with the loves of Romeo and Juliet, but it is a much more essential part of the tale that Rudabeh lets down her long hair, to serve as a ladder for her lover to ascend to her chamber, an incident found in the French story of Finetta, in the *Pentamerone*, and in modern folk-tales; Firdusi makes Sal decline the offer from politeness and find another mode of ascent, a piece of modern rationalism which shows how cautiously any version of a myth that rests on his authority must be received; but the fact that he did not venture to omit an incident which he makes appear preposterous shows the strength of the tradition which he followed. Dr. Ethé, again, compares the mysterious worm kept by Heftwad's daughter and slain by Ardeschir with all the treasure-guarding dragons of Norse and German Sagas, but he does not refer to Mohl's conjecture, which one or two phrases seem to make very plausible, that there is at least an allusion in the text to the introduction of silkworms, and the abnormal, dangerous growth of the reptile seems less akin to the stories of dragons or snakes than to the fancy, most frequently met with in mediæval fiction,

of an overgrown animal that preys upon its master; like the Jewish legend of a fly as big as a pigeon with copper beak and iron claws that preyed, for his sins against the Temple, upon the brain of the Emperor Titus.

M. Carrière contributes to the *Allgemeine Zeitung* (June 22 ff.) an account of the relations between Liebig and Graf von Platen, who were fellow students at the University of Erlangen, with some interesting details respecting the early life of the great chemist.

The Autobiography of Lucas Geizhöfner, recently published at Vienna, is a simple and straightforward account of the adventures of a wandering scholar and professor at the end of the sixteenth century; he had the fortune to escape death during the Massacre of St. Bartholomew, at which time he was lodging at Paris, in the house of a priest (of whose high charges and poor fare he complained in pathetic terms), by the connivance of his host, who stood at the house door, in full priestly garb, and steadily denied the presence of any Huguenot in his dwelling. The memoirs conclude when, at the age of forty, the writer settled at Augsburg and married, and are not without interest as a picture of the citizen life of the period.

Professor Hartt, of Cornell University, has published in the *Transactions of the American Philological Society* some valuable notes on the "Lingoa Geral" of the South American Indians, the modern form of the old Tupi language, which, however, has changed so much from that reduced to writing by the Jesuit missionaries of 200 years ago as to be almost unintelligible to travellers only acquainted with their grammars and dictionaries. Professor Hartt is preparing for publication a volume of legends, myths, &c., taken down from the natives as he was collecting materials for a fresh vocabulary. Many of the tales are old friends: the adventure of Jack the Giant-killer and the Welsh giant, the bird-maiden (with a dress of parrot feathers), water spirits of the Lorelei class, and wood spirits, with reversed feet, whose tracks lead the traveller astray, a race between the tortoise and the deer, won by the former, who stations her relations along the course at short distances, the gift to a hunter of arrows that cannot miss their mark, &c., are a few of the points of contact with the folklore of the Old World mentioned in this introductory paper.

Under the title "La Grande Armée à Moscou d'après les témoignages Muscovites" M. A. Rambaud paraphrases in the *Revue des deux Mondes* (July 1) a recent Russian publication, by the lady who uses the pseudonym T. Tolytchef. She had taken down, in the words of the few surviving witnesses of the events of 1812, such accounts of the burning of Moscow, the conduct of the invaders, and the temper of the vanquished as she could meet with. M. Rambaud not unnaturally selects for reproduction anecdotes which prove the French soldiers (and after them the Poles) to have been the most amiable and popular of invaders, but there are also stories of prudent revenge and resolute assassination which help to account for the rapid dwindling of the victorious force; the other point fixed in the narrators' memory was the destitution and suffering of the troops before the retreat, from the first entry into Moscow; the starving natives used to give clothes and food to the still more miserable foreigners.

An article on the Fall of O'Connell by R. Pauli in the June number of *Preussische Jahrbücher* (a chapter from the author's forthcoming third volume of the History of England from the Peace of 1813-14) may be profitably read in connection with the vindication of the Liberator's private character attempted in *Macmillan*.

*Im neuen Reich* (June 20) has an interesting paper on the Prussian *Abiturientenarbeiten*, or leaving examinations of the Gymnasium, by a commission of university professors. It appears that the schoolmasters (as it was surmised would be the case in England) are by no means content to accept the verdict of the commissioners when it chances to be unfavourable, while the universities complain of a gross ignorance of German literature and grammar and an undue taste for phrase-making, as characterising the students sent up for

examination from many if not most of the schools in the neighbourhood of the Rhine.

Prof. J. Frohschammer has just published a work *Das neue Wissen und der neue Glaube*, the tenor of which is sufficiently indicated by the same writer's paper on Dr. Strauss in the *Contemporary Review* for June.

## Art and Archaeology.

**A Theory of Harmony founded on the Tempered Scale.** By John Stainer, M.A., Mus. Doc., Organist of St. Paul's Cathedral. Rivingtons. 1872.

DR. STAINER has prefixed to the second edition of his work on harmony two prefaces containing remarks on the relation of the physical laws of sound to the art of music. The first of these prefaces appeared in the original edition. In the second, the author disclaims the intention, apparently attributed to him by some critic, of discarding or underrating the value of scientific research in this field. No fair-minded man can suppose, for a moment, that Dr. Stainer desires to assign to musical acoustics a lower position than that which he thinks it legitimately entitled to occupy. There still remains, however, the question whether he has rightly estimated the claims of that branch of physical science. This question I now propose to examine with the care due to opinions deliberately expressed by a musician of Dr. Stainer's reputation and official position.

Dr. Stainer holds that "the real bearing of the science of acoustics on the art of composition is exceedingly slight:" let us see then whether he gives it credit for the results which it has indisputably attained. Any one who has attended to the progress of acoustics during the last ten years knows that the physical causes on which dissonance in music depend have been completely determined by Professor Helmholtz. It was to be expected, therefore, that if Dr. Stainer had occasion to touch on the cause of dissonance in any particular interval, he would state what was at least not opposed to Helmholtz's demonstrated theory. At p. 11, however, he assigns, as the reason why the interval C—F $\sharp$  is discordant, *that the note D is implied*—an assertion which has no place in the true theory of dissonance, and is, in fact, entirely erroneous. The real reason is, of course, that the first harmonic (F $\sharp$ ) of the upper note is only separated by a semi-tone from the second harmonic (G) of the lower note. On p. viii appears the following passage, apparently meant to describe the method by which the consonant intervals of the scale are determined in the "mathematical theory of harmony":—

"From a few natural harmonics exhibited in a diagram about a dozen of the hundreds of chords in use are constructed; the insufficiency of the number of chords being then too apparent, Nature is taxed with being out of tune, and tempered intervals are introduced to allow of the construction of some of the most ordinary chords in music."

This may perhaps be a fair representation of the views of some theoretical musicians, but it is the merest caricature of the only doctrine which can properly be called a "mathematical theory of harmony," viz. that of Helmholtz. Only "a few" harmonics are, it is true, taken into account by this theory, because no more than a few are well developed in the sounds employed in music. So far from taxing Nature with being out of tune in order to introduce tempered intervals, the theory on the contrary taxes the tempered scale with being out of tune with Nature, and admits none but natural intervals.

Dr. Stainer's views as to the practicability of pure intonation are as follows:—

"It is said voices and instruments of the violin class, not only can, but do make use of an enharmonic scale. This is tantamount to saying

that singers and violinists, when reading from a separate part, know whether a note they are sounding is used by the composer according to its apparent notation, or as a part of a chord of a different nature, or as both interchangeably; and not only this, but are also aware in each case what the fundamental sound is, from which the ratios of vibrations are calculated, and what is the exact ratio of the note they are sounding, and in defiance of notation are altering the pitch of the sound, or in other words are making two or more notes out of the one before them, so as to adapt it to its various combinations. Such a statement may be taken for what it is worth" (p. vii).

The assertion that voices and violins can and do perform *natural intervals* is entirely untouched by the above arguments, which are valid only against a totally different assertion, viz. that such intervals can be executed at sight from a *single part* written in the *established musical notation*. In fact Dr. Stainer has here merely dressed up a dummy, and then demolished it to his own satisfaction. All that is requisite in order to execute a natural interval is to have that interval definitely indicated. A single part written in the established notation does not supply such an indication. But let the performer know, either from a glance at the score or from previous experience, in what relation the notes set down for him stand to the key-note for the time being, and the impossibility of pure intonation is at once done away with. A single part written in the "Tonic-Sol-Fa" notation gives, by the very principle of the system adopted, exactly this information at every step, and thus enables the executant to surmount with the utmost ease all the difficulties so unnecessarily heaped up by Dr. Stainer. The body of Tonic-Sol-Faists constitute a standing refutation of his assertion that voices cannot sing an enharmonic scale. With regard to violinists a decisive piece of evidence is to hand in an experiment made by Professor Helmholtz with the aid of Herr Joachim. By means of a harmonium containing stops tuned according to both the natural and tempered systems, it was conclusively ascertained that this eminent violinist played the enharmonic, and not the tempered scale.

The opening statement of our author (p. vii) that "the whole of our musical literature from the works of Bach to those of Wagner would be unavailable for instruments with an enharmonic scale" is at once overturned by the well-known fact that the most intricate concerted music has been published in, and is constantly being performed from, the Tonic-Sol-Fa notation, which is based exclusively on an enharmonic scale.

The above examination of the positions taken up by Dr. Stainer seems necessarily to point to but one conclusion, viz. that he has not sufficiently acquainted himself with the latest results obtained in the domain of acoustics, and with the easily accessible facts by which those results are confirmed, to be able duly to appreciate the bearing of that science on music.

In passing to the subject of the classification of chords to which the bulk of Dr. Stainer's work is devoted, I desire to drop the confident tone hitherto adopted, and to speak simply as an amateur expressing the mode in which the practical conclusions of a musician of eminence and experience strike him. The principle of classification employed is "to begin with the tonic and to go on adding thirds from the scale until the whole of the notes of the scale are exhausted." The chords so obtained are named after the largest interval contained in them before inversion. The following considerations appear to be of some weight in estimating the value of this mode of classification. It can be carried out consistently only in the fundamental position of each chord; on inversion, other intervals besides thirds enter as constituents. Further, it artificially increases the number of inversions of particular chords, and involves the frequent mention of intervals wider than an octave, which

are not very easily recognized. The experience of teachers must decide how far, for instance, the two chords BDF♯C' and E♭B'DG' are best described as respectively "the sixth inversion of the major thirteenth of D" (p. 37) and "the sixth inversion of the chord of the minor thirteenth of G minor" (p. 46).

Two more points in which Dr. Stainer has deviated from the practice of his predecessors remain to be noticed. The first is that he has replaced the dull bald "examples" of the old harmony-books by a series of extremely well selected and most interesting citations from the works of the great writers. He is further to be congratulated on having shaken off the traditional maxims about "licences" and "forbidden sequences" to which the older harmonists were in so rigorous a bondage. SEDLEY TAYLOR.

#### THE MONASTERY OF SAN FRANCESCO AT ASSISI.

VISITORS to the monastery of San Francesco at Assisi will have observed great changes of late years in the aspect of the two churches which contain so many of the treasures of old Italian art. The friars who were allowed to end their days in the sanctuary of St. Francis have, most of them, passed away to a better world. Those that remain still say a mass for such as can pay for it; but even this will shortly cease, and Assisi will be the rendezvous exclusively of pilgrims not seeking for "the pardon of St. Francis." Under these circumstances it has been found possible to achieve what no one could have achieved so long as the friars had power, namely the restoration of the churches to their primitive condition.

As the traveller, at dawn, made his way into the lower church to see the rising sun illuminating the low vaultings of an edifice all covered with Florentine and Siennese paintings of the thirteenth and fourteenth centuries he found the grand effect of these masterpieces marred in many places by modern woodwork of orchestras and altars,—Giotto's Miracle of the Resurrection of the Child cut in two by a chorister stand, St. Hilarius in Lorenzetti's fresco of St. Francis receiving the Stigmata half covered by an orchestra. Fragments broken off in recent times for the sake of these needless additions have been sold for fabulous prices. Under the supervision of Signor Cavalcaselle these incongruities are rapidly disappearing, and the lower as well as the upper church are assuming something like the form they were intended to display when first they were planned. The same process is being carried out in both churches, namely the removal of modern additions particularly of woodwork, and the restoration of the pictures to their original size and importance. With the help of Signor Botti, who so ably cleaned and strengthened the frescoes of Giotto in the Scrovegni chapel at Padua, the frescoes are subjected to a necessary process of renovation which seals the painted surfaces to the intonaco as well as the intonaco to the substructure, due diligence being used to fill up with a durable medium the gaps which time and neglect have made in the walls. In the upper church a grand simplicity of lines has been attained by the removal of the wooden choirs, the wooden altars, organ and choir lofts. Of these all that is valuable, such as the choir ornaments and woodwork, are to be set up in one of the halls of the monastery. Wherever the old surfaces have been laid bare pillars and paintings have been brought to light which add to the beauty of the building. Two doors have been found leading from the choir to the wells of two spiral stairs forming an external communication between the upper and the lower churches. It is to be hoped that after all opposition has been overcome from clergy, local art committees, municipal councillors, prefects, and fiery members of the Italian parliament, new obstacles may not be raised to the completion of this most useful and interesting undertaking. The general clearance now made has greatly contributed to increase the magnificent effect produced by the grand proportion of the building. The transfer of the high altar of the upper church to the centre of the transept where it originally stood, the restoration of the steps which parted the transept from the nave, will it is confidently believed only heighten the effect realized in a manner so striking and so happy by the earlier changes already enumerated. J. A. CROWE.

#### DISCOVERY OF THE MISSING RAPHAEL TAPESTRY.

THE history of the Raphael designs and of the tapestries worked from them for the decoration of the Sistine Chapel forms quite a long episode in the history of Italian art. The survival of the seven cartoons now in the South Kensington Museum, under the barbarous treatment they have received, is in itself as remarkable as the survival of some of the weak, defenceless species of animals in the Darwinian account of the "struggle for existence." Every one knows that these cartoons were originally ten in number, and that the ten tapestries worked from them may still be seen on high festival days hung on the walls of the chapel for which they were designed. But besides these ten compositions from the lives of the apostles, it is known that Raphael designed an eleventh cartoon for the decoration of the high altar representing the coronation of the Virgin Mary. Both the cartoon and the tapestry of this grand altar-piece have been supposed by most writers on the subject to have long since perished. Passavant however gives a hint that this may possibly not have been the case, for in his *Life of Raphael* (tome ii., page 211) he says "Et maintenant que cette tapisserie soit encore enfouie dans quelque coin du Vatican, ou que pendant les orages de la Révolution elle ait été enlevée et détruite par l'appât de l'or qu'elle pouvait contenir, c'est un point que nous ne sommes pas parvenu à éclaircir."

Acting probably on this suggestion M. Paliard determined some time ago to search for this missing treasure, and in a letter addressed to the editor of the *Gazette des Beaux-Arts* of this month he announces for the first time the fortunate result of his labours. "I am happy," he says, "to announce to you that this tapestry (the Coronation of the Virgin) exists. I have found it."

After having carefully explored the atelier painted by Giovanni da Udine where the numerous tapestries of the Vatican are stored and repaired, after having visited the pontifical manufactory established at Saint Michel where old tapestries are often restored as well as new ones executed, and having searched every place where he thought the lost work was at all likely to be stowed away, M. Paliard was, he tells us, about to give up his quest in despair, when one day on questioning one of the foremen of the Saint Michel manufactory he was conducted by him to a room in the Vatican called "La stanza della predica dei famigliari" containing eight tapestries, among which he immediately recognised the "Coronation of the Virgin." The room in which it was hung was one of the private apartments of the Pope on the second story of the Vatican, and contained besides Raphael's altar-piece a tapestry of the "Last Supper" of Leonardo da Vinci apparently of the original size, a large tapestry from the Gobelin looms representing Athalia and Joas, Joas being a portrait of Louis XV. when very young, and five other smaller and less remarkable works.

The description M. Paliard gives of the tapestry that he has discovered does not differ from that of Passavant, except that the latter not having seen the original was not able to name the colours of the drapery of the figures.

God the Father clothed in red with a triangle of gold behind His head is over all. He holds a globe surmounted by a red cross in His left hand and extends the right to bless the world.

The Dove of the Spirit flies beneath, his rays descending upon the head of Christ, who is seated, clothed in red, and holds the crown above the head of his mother. His looks are directed towards her and not towards the Father as in the "Coronation" of the Maddalena Oddi. The Virgin, clothed in a red robe and blue mantle, is seated to the right of her Son and bends her head lowlywise to receive the crown. Two large angels, one on each side, hold the canopy of the throne on which she and her Son are seated. Below on the left is St. John the Baptist pointing to Christ, and on the right St. Jerome with his lion. These last two saints were probably introduced in honour of Leo X., St. John in allusion to his name, Giovanni de' Medici, and St. Jerome on account of the lion, *Leone* the designation chosen by him on his elevation to the Papacy. In the drawing at Oxford for this subject the saints are St. Peter and St. Paul.

The tissue of this latest discovered tapestry is the same as that of the other ten, and was probably brought with them from Arras, or as M. Paliard asserts, from some other town in Flanders.

In measuring the tapestries of the Sistine Chapel M. Paliard found them somewhat smaller than the corresponding cartoons at South Kensington, a fact he accounts for by the shrinking of the tissue when withdrawn from the looms, for it is evident by the prickings made in the cartoons, which extend to the edges, that the tapestries were woven direct from the designs.

One other circumstance is noticeable in the tapestry of the "Coronation of the Virgin." It has not been inversed in the weaving, as are the other ten tapestries. This inversion, which has in many respects marred the harmony of the other tapestries, would indeed have been ridiculous in this, for we should have had God the Father blessing with His left hand and holding the globe in His right; the Virgin crowned by the left hand of her Son and seated on his left side, besides the two saints below being respectively in the wrong position.

Such is the history that M. Paliard gives of this last treasure-trove in the world of art. After this, it is to be hoped that the missing cartoons may yet turn up in some nook or corner of the world. Would that South Kensington might be fortunate enough to secure them.

M. M. HEATON.

### NOTES ON ART.

The *Gazette des Beaux-Arts* for July contains: 1. A description of a large Salon in the Château de Saint-Roch, on the borders of the Garonne, a newly-built mansion that has been artistically decorated by its proprietor, M. George de Monbrison. The Salon of the Château especially has been magnificently adorned by the artist employed upon it, M. Lechevallier-Chevignard, in the style of the French Renaissance under Henri II. M. Olivier Merson, the writer of the article, considers that M. Chevignard has achieved a complete success in this work, "aussi savamment conçue dans son ensemble et ses parties, qu'heureusement poursuivie et terminée," but after all, judging from the two designs of panels given in the *Gazette*, the artist has only imitated old models. We seem to know every curve and Renaissance grotesque in the "Fragment du dallage en Faïence." Why cannot decorative artists find something new? —2. M. Ernest Renan continues and finishes his instructive account of Phœnician art. Unfortunately his subject is limited by reason of the very few remains that have been discovered of the art of this industrial nation. Nevertheless M. Renan divides the ancient monuments, &c., of Phœnicia into three distinct classes, corresponding it would seem, as in other countries, to three different epochs—viz. the monuments anterior to Greek influence, the monuments in which Greek or Græco-Roman influence is perceptible, and the monuments purely Greek or Roman. He recommends all future explorers of Phœnicia to keep to the sea-coast, as ancient Phœnicia was but a series of ports the civilisation of which did not extend far inland.—3. M. Georges Lafenestre concludes his criticism of the Salon of 1873 in a long article profusely illustrated with woodcuts from the various pictures noticed.—4. A description of the pictures in the Musée de Lille which will not, we imagine, tempt travellers to go out of their way in order to visit that museum, although M. Louis Gonse assures them that they will meet with some "rare and very Dutch masters" (*maîtres rares et très-hollandais*) that they do not often see in other exhibitions, and that "if they find less to admire they will perhaps find more to learn!"—5. An article by M. Henry Havard, entitled "Exposition Rétrospective d'Amsterdam," that gives an account of the various works of art exhibited by the Society *Arti et Amicitiae* at Amsterdam. Pictures were excluded from this exhibition, which was especially rich in the works of the jeweller, carver, cabinet-maker, and potter.—6. The letter of M. Paliard, of which the substance is given in another place, concerning the recovered tapestry of the "Coronation of the Virgin."

A fine etching by Le Rat of a portrait of a lady in a ruff attributed to Pourbus in the Rothan Gallery is the chief illustration of the number, although it is not mentioned in the list of illustrations and has nothing to do with the text.

The two new courts at the South Kensington Museum are nearly ready, and will probably be open before this note appears. Mr. J. H. Pollen is engaged on a descriptive catalogue of the works of art they contain, the value of which will be enhanced by biographical notices and historical criticism.

Dr. H. Holland has recently published the *Life and Works of Moritz von Schwind*. The artist's own letters and the remembrances of his friends make up the personal and most interesting part of the biography, but an analysis of Schwind's "artistic individuality," (*Künstlerischer Eigenthümlichkeit*), shows a certain amount of insight into the character and meaning of Schwind's art. Moritz von Schwind was one of the most popular artists of the modern German school, and much has been written about him by German critics. This is the second biography that has appeared of him, one by Führich having been published shortly after Schwind's death. At the same time with Dr. Holland's *Life*, Dr. Lücke has brought out Schwind's illustrations to *Cinderella* with an explanatory text, and also with an interesting biographical sketch of the artist.

The *Zeitschrift für bildende Kunst* is again enriched with one of Unger's admirable etchings from the Gallery at Cassel. This time it is a winter landscape by Rembrandt that has called forth his powers.

The current number of the *Portfolio* contains a beautiful etching by Mr. Hamerton, entitled "Crossing the Loch." A small boat with a large and peculiar lug-sail is driving through water which is all ablaze with the reflected light of an evening sky. The complex colours of the scene are wonderfully well rendered. "The Sylvan Year" is continued, and contains some very sensible remarks on the true value of detail in art. It is illustrated by two small etchings, one of which by Greux, after Dupré, is a perfect gem.

Josef von Keller, one of the best engravers in Germany, died a short time since at Düsseldorf, where for more than thirty years he had been a respected teacher in the Academy. His most celebrated work is a large engraving from Raphael's "Disputa" in the Vatican. Several other of Raphael's paintings were likewise engraved by him, and one of his last works was the "San Sisto Madonna." Scheffer's "Christ in the Tomb" is perhaps his best known though by no means his greatest engraving. Keller, who was born in 1815, may be considered the founder of the modern school of German engraving, and his influence is clearly seen in many of the works of the younger artists.

A congress will meet at Vienna on the 1st of September, not to decide, as we might at the first blush assume, upon the fate of the continent, but to discuss important questions in reference to science and art. The subjects to be ventilated are: our wants and duties as regards the administration of public galleries and the production of catalogues of pictures; the best methods of preserving pictures and drawings; methods of teaching in schools and universities; an universal register of works of art and reproductions of pictures and drawings. A congress of this kind, if attended by professional men from all parts of the world, may produce some good general results. It will certainly lead to a valuable interchange of ideas, and give to critics and art historians an opportunity of becoming acquainted with each other which it would be folly to neglect.

To make this congress attractive we have the International Exhibition—which many persons will visit for its own sake. Another display, unique of its kind as far as Austria is concerned, will add very greatly to the attractions of a visit. In August and September there will be an exhibition of works of the old masters selected from the private galleries of Vienna; and those who have any knowledge of these collections can tell how rich they are in fine examples of all the most celebrated schools.

## Philosophy and Science.

Letters, Lectures, and Reviews, including "Phrontisterion, or Oxford in the 19th century." By the Very Rev. H. L. Mansel, D.D. Edited by H. M. Chandler. Murray.

THE only portion of this volume which has not been already published is of very slight value. It consists of (1) an attack on utilitarianism which must be pronounced inadequate and commonplace; and (2) a fragment on Berkeley, which would perhaps have been interesting, but as far as it goes only gives clearly and exactly that corrected view of Berkeleyianism which we owe chiefly to Ferrier and Mr. Fraser.\*

Nor do we think that the volume generally will tend to raise Mansel's reputation with those who only know his larger works. Though he was, in a certain sense, a man of learning, the range within which his mind worked effectively seems to have been very limited. On topics beyond this range, as e.g. on the oddly selected subjects of "Sensation Novels" and "Modern Spiritualism," he gives merely vigorous and condensed reflection of a perfectly commonplace kind, with a touch of thin, dry humour, and a meagre sprinkling of old-fashioned academic wit. The Aristophanic parody "Phrontisterion," directed against the first Oxford Commission, will no doubt entertain at least academic readers, even now. The dialogue between the "Model Manchester Man" and his son "Pheidippides-Johnny" is happily planned, and the Chorus of Cloudy Professors is in parts very effective: e.g. the Pantheists' Hymn is quite a *tour de force*.

"Hail Light with Darkness joined!  
 Thou Potent Impotence!  
 Thou Quantitative Point  
 Of all Indifference!"

\* It ought to be said that before the appearance of Mr. Fraser's edition Mansel had shown (in Append. to *Prolegomena Logica*) that he was quite free from the vulgar misrepresentations of the Scotch polemic against Berkeley, which even the erudition of Hamilton did not dispel.

Great Non-existence, passing into Being,  
 Thou twofold Pole of the Electric one,  
 Thou Lawless Law, thou Seer all unseeing,  
 Thou Process, ever doing, never done!  
 Thou Positive Negation,  
 Negative Affirmation,  
 Thou great Totality of every thing  
 That never is, but ever doth become. . . ."

Still, generally speaking, though the verse is written with point and vigour, the substance of the satire is not much above the average level of an irritated common-room.

On graver and deeper topics again Mansel does not seem to have had much left to say, when he had sufficiently enforced the peculiar doctrines, logical and theological, with which he is identified. On "Freethinking," for example, one would have expected his remarks to be pregnant if not original: but the essay is almost entirely a piece of vigorous but very unconstructive polemic. The function of barking continually as a sort of philosophic watch-dog at the gate of theological tradition does not tend to enrich the intellect, with however earnest sincerity (as in Mansel's case) it may have been embraced. On the other hand the article on "Modern German Philosophy" is an excellent piece of popular exposition, up to the point to which the writer has really understood what he is explaining. It would be hard to make the general scheme of the development of thought from Kant to Hegel plainer to common sense than he has here made it. But when he attempts to describe the Hegelian system, the exposition suddenly passes from luminosity into a most puzzling twilight. It is almost inexplicable how so careful a writer could have been misled into saying that "the highest abstraction of all . . . is in the Hegelian system the fullest and most complete reality"—thus actually reversing the true process of thought and identifying Hegel with Parmenides!

But even where Mansel is expounding his special views, we do not find quite so much clearness and consistency of statement as we should have expected. Take for example his well-known doctrine of the Limits of Religious Thought. It is surprisingly hard to ascertain what these limits precisely are. Sometimes he seems to propound what we may call Regulationism in its extremest form. Theological beliefs, we are told, are "designed not to satisfy our reason, but to guide our practice: not to tell us what God is, but how He wills that we should think of Him." Hence it is no argument against the "regulative truth" of two theological propositions that they contradict one another: e.g. it is right to believe at the same time that God "hears and answers prayer" and that "His counsel is immutable." Nay, further, it is quite useless to offer any explanation of the contradiction, for "as my conception of the nature and purposes of God is merely negative" such an explanation "explains nothing."

This language is definite enough: but it leaves us in great perplexity as to the method of theology. It is of no use to say that it is restricted to the interpretation of Revelation: for the deduction of dogma from Scripture is a process of reasoning, which has always been guided by the maxim that different texts of Scripture must be made mutually consistent. Now either this maxim is invalid, in which case the creeds must crumble again into a chaos of texts: or if it is valid, we require some criterion to distinguish the contradictions that we ought to avoid in theology from those that we ought to embrace. Such a criterion Mansel never offers: and he seems to deal in a perfectly arbitrary manner with the antinomies which beset the exercise of our reason when it strives to attain the absolute. E.g. (1) we can conceive neither "unlimited duration" nor "absolutely first moment of time": and here we are told that it is "impossible to believe that both can be true." Similarly (2) we cannot conceive either fixed

purpose or accessibility to prayer as attributes of the Infinite and Absolute Being: as far as we can conceive the two attributes they are strictly incompatible: yet here Mansel says that we *can* believe that they are capable of combination. In this he was perhaps imitating Kant, who also offers two different explanations of his two kinds of antinomies. But then Kant's are closely reasoned solutions, whereas Mansel's are unreasoned modes of dealing with the insoluble as such.

It is perhaps in order to avoid the harsh paradox of presenting theological dogma as a bundle of arbitrarily selected contradictions, that elsewhere the "Regulationism" of the passages above quoted is much softened down. In the phrase "regulative truth" the noun has quite lost its ordinary signification: it means not a belief which corresponds to a reality, but a belief that it is our duty to accept. But elsewhere he speaks of these beliefs as containing speculative truth of a "partial," "imperfect," "analogical" kind: and in one or two passages the assertion that we can only form a *negative* conception of God seems to mean no more than that we cannot form a *complete* or *adequate* conception of Him; which is a sufficiently trite and generally accepted proposition.

One point of interest in this collection of papers is the gradual divergence of Mansel's system from Kantism, which we are enabled to some extent to trace chronologically. The divergence originates in the attempt to base Kantian principles on empirical psychology. How great a change this procedure involved, it is doubtful whether Mansel ever clearly saw. Certainly in 1851 when he wrote on "Recent Extensions in Formal Logic" he had no idea of it. He then appears to accept altogether the Kantian view of cause, recognising (1) an analytical "principle of sense and effect" (better reason and consequent) governing hypothetical syllogisms, and (2) a corresponding synthetical principle, by which when "I hold a piece of wax to the fire and it begins to melt" I judge that the proximity of the fire is the *cause* of the melting of the wax. Here "the matter of the judgment is given in the successive phenomena, 'the fire is applied, the wax melts: ' the form is given by the mind, which is compelled to assert a causal relation between them." All this sounds sufficiently Kantian, and probably seemed so to Mansel, until he began to ask himself what he precisely meant by saying that the mind was "compelled to assert" a causal relation. What Kant meant was that experience is strictly impossible without this assertion: for experience involves a distinction between the objective order in which facts occur and the subjective order of my own states of consciousness, which vanishes unless I conceive each successive phenomenon to stand in a determinate relation to some antecedent. But what did Mansel mean? Perhaps he scarcely knew at the time of writing this article: but two years afterwards when his *Prolegomena Logica* appeared it was clear that he meant a very different kind of "necessity" from the Kantian: a psychological, and (as he calls it) *negative* necessity, which really refers only to each individual phenomenon taken by itself, and has nothing properly to do with uniformity of sequence. In carrying out his principle of bringing philosophy to "the test of psychology" Mansel rather strangely combined Kant's view of cause as a form of thought with Hume's principle that every idea must be derived from an impression or presentation. This presentation is found in an act of will, when I am presented to myself as causing my own volition. But the application of an idea so derived to external phenomena can furnish no positive knowledge. It leads me to affirm nothing more of material changes than that I cannot conceive them to result from the self-determination of matter. And in fact we find

from Mansel's controversy with Whewell in 1853 that he had then arrived at a complete rejection of Rational Physics: and it appears from *Prolegomena Logica* that he had about the same time given up the hypothetical syllogism as a distinct form of reasoning.

H. SIDGWICK.

**The Tongue not essential to Speech.** By the Hon. Edward Twisleton. Murray. 1873.

THIS book is an elaborate examination of the credibility of the supposed miraculous restoration of speech in the case of certain persons known as the African confessors, who at Tiposa in the Roman province of Mauritania Cæsariensis at the end of the fifth century, to the number of fifty or sixty, suffered amputation of the tongue—as a punishment for resisting the authority of an Arian bishop. The alleged miracle is one which is recorded by Gibbon, who states the irresistible evidence in favour of its having occurred, but offers no explanation of it. It is one of the nine miracles selected by Dr. Newman in an essay published in 1843 as being true miracles, whilst spurious miracles were admitted by him to have been palmed upon the church both in apostolic times and in early and late post-apostolic periods. The miracle of the African confessors is the only one of the nine which is supported by the evidence of eye-witnesses. The evidence has been well sifted and criticized by a variety of inquirers. It baffled Gibbon and was a pillar of strength to Dr. Newman. In an appendix to this book, amongst other things Mr. Twisleton shows with considerable skill and by use of a wide range of information that the eight other miracles accepted by Dr. Newman are devoid of anything like conclusive or unimpeachable evidence. Hence the case of the African confessors becomes a very important one.

It collapses in a very curious way. The facts are admitted—they do not allow of a doubt—that the confessors did have their tongues cut out, and nevertheless they recovered speech. But so have a good many other people. Such recovery or retention of speech is not at all an uncommon thing, and the notion of a miracle in the matter is gratuitous and meaningless. This is the upshot of Mr. Twisleton's inquiry into the matter, and the history of belief in this now definitely exploded marvel forms a contribution to scientific literature highly interesting to the student of the varieties and modes of human superstition. The escape from loss of speech after excision of the tongue is no more supernatural than the escape from the dangers of an enchanted forest or the machinations of a reputed sorcerer, which has not unfrequently in past times been commemorated as a miraculous favour of providential interference.

A variety of cases are cited in great detail by Mr. Twisleton of persons in this and other countries who have been carefully examined by medical men (one case is attested by Professors Faraday and Huxley, Dean Milman, and Mr. Nunneley, the surgeon who operated) in which the power of speech was retained after excision of a portion or the whole of the tongue.

The Shahs of Persia in fact appear to be in the habit of causing this operation to be performed upon their subjects—together with that of burning the eyes with hot irons—when they have cause to feel ill-disposed towards them; and it is well known in that country that the power of speech is retained after the loss of the tongue. It is a curious fact, which is established by the evidence adduced in this volume, that speech is often less impaired by the removal of a large portion of the tongue than by merely cutting away the tip: and persons in the East who have been clumsily operated upon by the public executioner actually submit themselves to a kind of homœopathic cure for the impediment to speech

which such an operation produces: they have the tongue cut a second time.

There is then no ground for the popular notion that the tongue is the organ of speech in the sense that the eye is an organ of sight. Physiologists were sufficiently aware of this fact, but the truth may now be brought home to a more extended class. Loss of the tongue in the case of the person whose tongue was removed by Mr. Nunneley of Leeds, led to *impairment* of speech, as it probably does in all cases, but "his words were almost always intelligible, and the majority of them were very fairly pronounced." According to Professor Huxley's notes on this case, his pronunciation "accorded pretty well with what might have been predicted from the known mode in which the tongue takes part in the formation of different consonantal sounds."

E. RAY LANKESTER.

### Notes on Scientific Work.

#### Geography.

**Albert Nyanza.**—The news which arrives from Khartoum that Sir Samuel Baker's returning party "declare as an ascertained fact that Lakes Tanganyika and Albert Nyanza are proved to be one and the same water," and that "a vessel can be launched above the Murchison Falls at the head of the Nyanza and sail away to Ujiji," must be received with the greatest caution, and very strong proof will be required to overturn the existing evidence, which tends to show that the Tanganyika is not connected in any way with the Albert Lake, but that it is rather a continental basin having no direct communication with the ocean. Burton and Speke visited its eastern and western shores and Livingstone has gone round its southern coasts, without hearing of an outlet; and Livingstone and Stanley's special voyage from Ujiji to examine its northern half in search of an outflowing river failed to find more than an inflowing mountain stream. The water of the Tanganyika is not altogether fresh: "they contrast it," says Burton, "unfavourably with the water of its rival the Nyanza; it appears, moreover, to corrode metal and leather with exceptional power," whereas the water of the Albert Lake is perfectly pure. The mean of many barometric and boiling-point observations made by Dr. Livingstone gave the Tanganyika an elevation of 2880 feet, whilst the best computation that has been made from Sir Samuel Baker's observations of the level of the Albert Lake makes its surface 2500 feet above the sea. The great mountain belt which is known to extend between these lakes, from Mt. Mfumbiro (10,000 feet) seen by Speke to the Bategga mountains described by Dr. Livingstone, also makes it in the highest degree improbable that any river communication can exist.

**North Polar Area.**—The evidence given by the rescued portion of the crew of the "Polaris" has advanced knowledge of the arctic basin two degrees nearer to the pole and forms the strongest argument that has yet been brought forward in favour of what is known as the "Smith Sound route." Hitherto Parry's furthest point 82° 45' attained by boat sledges on the Spitzbergen side of Greenland has been pointed to as far in advance of any latitude attained in repeated voyages through Baffin Bay, but the actual passage of the ship "Polaris" to the high latitude of 82° 16' in Smith Sound has demonstrated this to be a preferable way to the pole. From an elevation of 1700 feet on the coast near this latitude land has been seen as far, it is believed, as the 84th degree, or at a distance of only 360 miles from the centre of the unknown area.

#### Zoology.

**The Branchial Rays of the Basking Shark (*Selachus maximus*).** By Japetus Steenstrup.—This peculiar sieve-like apparatus, which somewhat resembles a comb with very long teeth, has for a long time been an object of interest to naturalists and a subject for investigation, though as yet no great light has been thrown on its origin or uses. Prof. Hannover in his memoir on the dermal spines of the rays and sharks investigated its internal structure, and having found that each ray was of the same histological structure as a shark's spine appears to have suggested that they were external appendages. Steenstrup was always opposed to this idea, believing from their general form and disposition that they play a part comparable with that of the rays met with on the branchial arches of many fishes and notably on those feeding on very small animals. Several facts having tended to convince Steenstrup that this apparatus must belong to some great shark he was glad to find his views supported by a passage in a paper by Bishop Gunnerus of Trondhjem, published in

1765, which gives a description of this apparatus too exact to leave any longer any doubt that it was portion of the branchial apparatus of the basking shark; moreover it has enabled him to better understand certain hints as to its use which are given in the writings of Low, Pennant, Mitchell, and others.

Steenstrup arrives at the following conclusions:—1. The basking shark has the interior of its mouth furnished with a fringe or branchial mesh which presents the appearance of small rays like whalebone about five or six inches in length. These meshes are situated along the enormous branchial splits and serve as a strainer to collect particles of food. 2. This branchial fringe is of the same nature as the ray-like bodies so long preserved in the museums of Copenhagen, Kiel, Christiania, and Trondhjem. 3. The existence of this sieve-like apparatus indicates with certainty that the mode of life of this shark resembles that of the whalebone cetaceans, and that so far from its being a fish which is dangerous from its carnivorous propensities it lives on small animals caught in masses by means of this sieve. 4. The presence of these rays and their teeth-like structure furnish quite peculiar generic characters to *Selachus*. 5. The form and nature of these branchial rays shows that the genus *Selachus* existed in the seas of Europe at least in the tertiary period, as the *Hannovers aurata* of Beneden has been found in the Belgian Crag. The similarity in habits of this shark to the great *Rhinodon typicus* of the Tropics as described by Dr. Perceval Wright is alluded to by Steenstrup, who likewise very justly suggests that the kind of food of both fishes is the same (*K. D. Vidensk. Selsk. Forhandl.* 1873, Nr. 1, pp. 47, 66).

**On Bones Regurgitated by Birds of Prey and on their Markings.** By Japetus Steenstrup.—Large masses of bones of small vertebrates, chiefly mammals and birds, have of late years been discovered in the caves of Europe, and more especially in those of Belgium. The occurrence of such masses has been explained in various ways. During the discussions on this subject Professor Steenstrup was asked for an opinion respecting certain markings and corroded surfaces met with on these bones, and he replies in a brochure bearing the above title by stating that his interpretation is based on an examination of the bones of animals which have lain a certain time in the digestive organs of birds of prey, and which exhibit peculiar markings and corrosions that appear quite comparable with those on the bones from the caverns. He figures some duck-bones from the stomach of an eagle, and the crania of some sparrows from the pellet of *Strix flammea*, all having the same markings on them as those found in the European caves. When therefore certain writers on the antiquity of man, judging from these vast accumulations of bones, have come to the decision that certain tribes of the primitive inhabitants of Belgium lived exclusively on field-mice and moles and such "small deer," these conclusions may, to say the least, be erroneous unless by primitive inhabitants we understand primitive raptors.

When basing any calculation on the number of individual animals represented in any such collection of bones certain peculiarities of our birds of prey and other animals must, as Steenstrup remarks, not be overlooked. Some screech-owls, for example, prefer the heads of lemmings, and leave the bodies; the Lapland dogs only eat the fore-quarters of these little animals, while the Lapland fox would convey the whole of the animal to its den.

Steenstrup refers to the labours of his celebrated compatriot Dr. Lund in the caverns of Brazil, and gives an account of a cavern investigated by him in the estate called Escrevania. From this cavern during a fourteen weeks' exploration Dr. Lund extracted some 8348 barrels of material, each barrel weighing about four hundred weights; of these 6552 were of earth and 1796 of stones. Out of one of these barrels chosen at random from the first 4000 brought up Dr. Lund picked all the jaw-bones of mammals, and found that they numbered 2385, of which 18 belonged to *Cavia*, 26 to *Echimy*s, 901 to *Didelphis*, and 1440 to species of mice. A certain amount in this selected barrel will of course have escaped detection by having been broken or having crumbled into dust, and assuming this quantity to be 10 per cent. Dr. Lund considers the number of individuals found in this cavern to be about seven millions and a half, and that the whole of these little animals had been killed and eaten by the owl of these caverns (*Strix perlata*, Licht), a species very nearly related to the *Strix flammea*, L. of Europe. Dr. Lund also makes the interesting calculation that this charnel house must have taken at least 5000 years to have become packed to this extent. (*Vidensk. Meddel. fra den naturhist. For. i. Kjøben.* 1872. Nr. 13. 14.)

**Deep Sea Animals.**—George Ossian Sars has just published a quarto memoir with six plates "On some remarkable forms of animal life from the great deeps off the Norwegian coast," being partly from manuscripts of the late Prof. Michael Sars. The memoir is published in English as being "one of the great universal languages." In a brief introduction G. O. Sars reminds us that his father as early as 1850 declared himself opposed to Forbes's theory that the limit in depth of animal life in the ocean was 300 fathoms, and that it is to his investigations in 1868 at Lofoten that science is indebted for the knowledge that several hundred species of animals were to be met with living at this very depth. The father's memoir on *Rhinocrinus lofotensis* will not soon be forgotten, and the species described in this memoir were taken by the son at about the same time that he collected this little sea-lily. A brief enumeration of these

new forms, which are excellently illustrated, will not be without use. Of Polyzoa *Rhabdopleura mirabilis* and *Flustra abyssicola* are described. The former of these is a species of very special interest. Allman, guided by their mode of development, seems to regard the Polyzoa as more nearly allied to the Lamellibranchiata than the Brachiopoda. Judging from the organisation of this form M. Sars seems to think that it is in all probability derived from a Hydrozoan stem, and however like a Polyzoan, still as wanting the endocyst or mantle, it may reasonably be doubted whether, as at present defined, it can be logically included in this group. The Avicularia in the deep sea *Flustra* are most remarkable, the mandibular portion being spoon-shaped and of large size. Of *Conchifera* *Yoldia obtusa* and *Pecchiolia abyssicola* are redescribed and figured. Of *Cephalophora* *Dentalium agile* sp. n., *Triopa incisa* sp. n., and *Goniolitis typica* gen. et spec. nov. are described; of Annelida *Umbellisyllis fasciata* nov. gen. et sp. and *Paramphinoe pulchella* nov. gen. et sp.; and of Anthozoa *Mopsea borealis* sp. n. and *Fungiacyathus fragilis* nov. gen. et sp. The former, very nearly allied to *M. elongata* Esper., was found in about 300 fathoms at Skraaven not attached to rocks but living in a muddy bottom, while the latter, a new form of the free Turbinolidae, was brought up from a depth of about 300 fathoms in Lofoten in company with vast masses of *Ulocyathus arcticus*.

Of Spongiae are described *Trichostemma hemisphaericum* nov. gen. et spec., *Cladorhiza abyssicola* nov. gen. et spec., and *Hyalonema longissimum* sp. n.; this last form appears to be nearly related to the *H. boreale* Lov. and in no way allied to the genus *Hyalonema* of Gray. It is to be hoped that Mr. G. O. Sars will publish without delay further descriptions of the new species found by him in the great depths off the Norwegian coasts.

**Mollusca of Kristianiafjord.** By W. C. Brogger. With an Appendix on the Land and Fluvial Mollusca and Leeches of the district, by O. S. Jensen. Christiania: J. Dahl.—Brogger points out that the deepest water off Drobak is only 120 fathoms, and records the species of mollusca met with in the different zones of depth from 120 fathoms to the littoral zone. The lists seem carefully prepared, and some comments on the more interesting species or varieties are appended to the lists of species. Jensen describes the land and fresh water forms and figures the *Pisidium arcaforme* of Malm and a variety of *Arion ater* L.

**Carcinological contributions to a Norwegian Fauna.** By G. O. Sars. (Christiania: Published for the Royal Norwegian Society of Trondhjem.)—The first series of these contributions consists of a monograph of the Mysidae of the coast of Norway. Part i. of this monograph was published in 1870, and contained five lithographic plates. Part ii., issued late in 1872, contains three plates. It contains descriptions of a species of *Amblyops* (formerly *Amblyopsis*), *A. abbreviata*, and of three species of *Mysidopsis*, of which genus *Mysis didelphys* Norman is taken as the type.

### History.

**Memoriale fratris Walteri de Coventria.** Ed. W. Stubbs. Vol. II. (Rolls Series.)

THE annals of the reign of John contained in this volume are one of the most valuable contributions in existence to the history of that eventful period. Walter of Coventry copied them from a compilation made in the ten monasteries (perhaps Crowland or Peterborough) which again copied the little Chronicle of the monastery of Barnwell in Suffolk, drawn up within the first thirty years of the thirteenth century. The continual and precise references to the history of the eastern midland counties, and the great importance given to the episode of Fawkes de Breaute, the central interest of which lies in the county of Bedford, are enough to show that its author had his home or his means of information at no great distance from Cambridge. It is the earliest narrative of the concluding years of John's reign, with the exception of the contemporary chronicle of Ralph of Coggeshall, which was also drawn up in an eastern county, and it is very superior to Abbot Ralph's work. Professor Stubbs has practically published it for the first time, as only fragments of it were printed in the *Recueil des Historiens de France*. And he has availed himself of it to give a sketch of the character and reign of John like those given of his father and brother in previous volumes of the series, which taken together supply an unrivalled account of the Angevin kings.

The verdict of history fully confirms Giraldus Cambrensis' opinion of John that of all tyrants he was the very worst. He was the youngest of Henry II.'s sons, and his father (like Charlemagne's son Louis) brought on the troubles of his later years by his attempts to provide for the youngest son out of the lands he had already arranged to distribute among his eldest. "The rebellion of the younger Henry was provoked by an attempt to carve out a portion for John; for John's sake the attack on Ireland was carried out, and the crown of peacock's feathers obtained from Rome; the final rebellion of Richard was caused by the demand that Poitou should be given up to John." But the favourite son threw himself on the side of his father's enemies, and broke his father's heart. He was equally ungrateful for Richard's kindness, but Richard on his death-bed recommended him to the baronage of England for election as king in preference to Arthur of Brittany—with good reason distrusting Arthur's mother, Constance, the unfaithful wife of the Earl of Chester. The Queen-mother Eleanor (of whom Prof.

Stubbs gives a striking account) together with Richard's able ministers, Hubert Walter, Geoffrey FitzPeter, and William Marshall, continued Henry II.'s policy, and succeeded in supporting John for many years. And it is important to note that "just as the position of the Angevin dynasty in France collapses on the death of Eleanor, so in England the death of Hubert Walter marks the break up of friendly relations between the king and the Church, and the death of Geoffrey FitzPeter the final rupture with the baronage; while the very existence of the royal line depended for years on the adhesion of William Marshall."

It is needless to add that John was ungrateful to all his faithful ministers. His conduct to his barons was atrocious. Even his half-brother, William Longsword, Earl of Salisbury, was driven into revolt by John's incest with his wife. His injured queen Hawis of Gloucester, whom he divorced, afterwards, as wife of Geoffrey de Mandeville, helped to swell the tide of national feeling against him in 1215. There seems to be nothing that can be said in John's favour except that, like all Eleanor's children, he had a sort of taste for literature. At least we hear of his borrowing a copy of Pliny from the Abbot of Reading (Disraeli, *Amenities* i. 221). Perhaps too the inclination to Mahometanism attributed to him may be due to his literary training—the same suspicions existed as to his son-in-law the Emperor Frederic II.—the fact being that Saracen, Manichean, and Aristotelian (through Averroes) modes of thought had really produced much scepticism, which was increased by the arbitrary and unchristian conduct of the Papacy. Yet when John's tomb was examined in 1797 (Green's *History of Worcester*, vol. 2, fin.) it was found that he had been buried in a monk's cowl! It may remind us of Milton's scornful line—

"Some as Franciscan think to pass disguised."

We may notice that Potthast in his valuable *Regesta Pontificum*, just published, under the date of May 29, 1198 states that the letter addressed by Innocent to John (after appointing Stephen Langton archbishop), in which he expounds the meaning of the precious stones in the four rings he had sent him in a way which Hume ridicules, was probably not sent to John at all, but was really addressed to Richard. As to the date of Queen Eleanor's death, Prof. Stubbs inclines to accept the date of April 1, and it may be remarked that this is the traditionary date in Shakespeare—

"Her ear  
Is stopped with dust: the first of April died  
Your noble mother; and, as I hear, my lord,  
The lady Constance in a frenzy died  
Three days before."

To Shakespeare is also due the sympathy felt for such a savage woman as Constance; but when the poet wrote that splendid lament over Arthur he was probably giving relief to his own feelings at the death of his own son, dead that very year, 1596, in which *King John* was written. Prof. Stubbs concludes his interesting preface with some new information about Roger of Hoveden, whose chronicle forms the middle portion of the series, which begins with Benedict of Peterborough and ends with Walter of Coventry. The abstract we have given of the preface to this volume can convey little idea of the fullness of information contained in it.

C. W. BOASE.

*The Personal Life of George Grote.* By Mrs. Grote. 8vo. Murray. 1873.

THE grandfather of George Grote, the historian of Greece, came to England from Bremen towards the middle of the last century; his son married a lady whose family was of

French origin, and the historian therefore well represents in his own person that mixture of races which has contributed so much to form the English nation. Young George Grote was educated at the Charterhouse in company with Thirlwall, Havelock, and other eminent men, and when the *History of Greece* appeared Thirlwall wrote a most generous letter to his old schoolfellow, speaking most modestly of his own admirable work on the same subject. Another schoolfellow was Waddington, the late Dean of Durham, and it is amusing to hear that they both fell under Dr. Raine's rod on account of a farewell supper which Grote had given at the "Albion" Tavern. He was destined to help his father in the banking-house, and had to provide for himself the higher resources of intellectual occupation. Besides keeping up his classical knowledge, he learnt the violoncello, and used to accompany his mother on that instrument in playing Handel's compositions. Bentham was equally devoted to music, and in fact the old English passion for music never died out even in the last century. He began also to study political economy. Ricardo's conversation possessed a potent charm for him, and Ricardo introduced him to James Mill. Mrs. Grote has printed the letters that passed between him and his friend G. W. Norman at this time; the two young men lived much together, and often joined in the cricket-matches of West Kent. There is a curious notice long afterwards of his joining Malthus and Romilly in a spirited game of cricket. Another friend, C. Cameron, led the way in metaphysical study.

It was at these social meetings in West Kent that Grote met with his future wife, and a more romantic story has rarely been told than that of the true love which was crossed for a time by a most unscrupulous rival, who assured Grote as a fact that he knew the lady's heart and hand were engaged to another man, while his father was set against his marrying at all. During the two years of this enforced separation he came more and more under the influence of James Mill, who had the faculty of kindling in his auditors the generous impulses towards the popular side, both in politics and social theories. Grote now became a reader of Bentham's works on Jurisprudence, Reform of the Law, and Political Philosophy, and also frequented the society of the recluse author, who took pleasure in receiving guests at his board, though never more than one at a time. To his one guest he would talk fluently, yet without caring to listen in his turn. John Stuart Mill was then studying under his father, but was too young to take much share in conversation. We trust that his autobiography will give us some more details of the remarkable group of men who thus met together. In all this Mrs. Grote amply redeems her promise of telling "the history of a mind." When the engagement with Miss Harriet Lewin was renewed, his father insisted on their marriage being postponed for two years, and here some valuable extracts are inserted from the diary which Grote kept that Miss Lewin might know his way of life during the early period of their engagement. His readings in political economy continued, and we have such notices as this, "the reasons which hinder capital and labour from equalizing themselves in all trades," "Ricardo's striking and original remarks on the effect of a rise in wages." Miss Lewin similarly kept a record of her daily proceedings for his perusal. Grote notes on one occasion that he has been to the "Crown and Anchor" to hear Coleridge's lecture. After their marriage the young couple had to live in a house adjoining the banking-house, where the close air of the small court seriously affected Mrs. Grote's health, and they lost their only child.

In 1821 Grote began his literary activity by an essay on Parliamentary Reform, expressly directed against

Mackintosh's theory of class representation as set forth in the *Edinburgh Review*. In 1823 we already find him discussing the Greek mythology, but only "to show the entire uncertainty and worthlessness of tales to which early associations have so long familiarised all classical minds." This view he always adhered to, insisting that there was no siege of Troy, "no facts behind the legend," that "the curtain was the picture." The time was not yet come for comparative mythology to show that the fact behind the legend was a certain condition of the human mind, a certain stage of language. In 1826 Grote wrote an article in the *Westminster Review* on Mitford's *Greece*, that author's hatred of Athens and praise of Dionysius and other tyrants who had put down the demos having roused Grote's spirit as it did Thirlwall's. Mitford, it is true, had the great merit of having shown that ancient history was a living thing, and ancient politics really of an intensely modern cast, and hence deeply interesting. The progress of the *History of Greece* was however much checked by other matters in which Grote was at this time engaged, the founding of London University, and the movement in behalf of Parliamentary Reform. In 1830 a short visit was paid to Paris, where he saw Lafayette and became aware of the political crisis then fast approaching in the capital. Grote took a deep interest in the success of the "Revolution of July," which produced such a ferment in the English mind that it was found impossible to withstand the demands for political reforms which existed throughout the nation. Grote was elected M.P. for London in the Reform Parliament, and repeatedly tried to get the vote by ballot accepted—at a later period, after the suffrage had been so largely extended, he thought it less important. It is not till ten years afterwards that we find by his letters to Cornwall Lewis that he is devoting himself to his Greek studies again—this time to Aristotle. He resolved to abandon his unavailing and almost solitary struggle in Parliament, and did not stand again for London. Then came a long tour in Italy, and another visit to Paris, where he sought the acquaintance of Auguste Comte owing to the impression made on him by the *Philosophie Positive*. Grote's efficient help to Comte is well known. In 1846 the first two volumes of the *History of Greece* appeared, and at once made a striking sensation among scholars. Mrs. Grote has printed an interesting letter from Hallam on Homer and the Trojan War. Still the historian retained a most lively interest in modern politics, and the agitated condition of Swiss affairs in 1847 led to his *Letters on Switzerland*. The dissensions between the Cantons appeared to him curiously to resemble those which went on in the old Grecian world, and he travelled to Berne to attend the Diet and see the actual state of affairs; C. Lewis sums up his conclusions thus: "the cause of the mischief is religious bigotry working upon an imperfect federal constitution." The Revolution of 1848 in Paris caused intense anxiety among all true friends of France in England, and Mrs. Grote cannot refrain from adding an explanation of the reason why the Commune was allowed its own way in 1870 while it was put down by the National Guard in June, 1848—the answer being that the genuine civic character of the Guard was destroyed by its later reconstitution which made it a loose, incoherent, undisciplined body. They went again to Paris in 1849, and were very much grieved at the speeches of Tocqueville and other leaders in the Assembly. Tocqueville in advocating the expedition to Rome spoke of "the population of Rome having been coerced by a faction." When Louis Napoleon overthrew the constitution, Grote sums up the conduct of the majority as follows:—"They have been helping, and even outrunning, the President, for the last two years, in crushing everything like public liberty

and the popular force. They have done this without seeing that the popular force formed the only security to themselves as against him, and that as soon as they ceased to have a spirited and free spoken political public under them, they were at the mercy of the executive power, even for their own personal safety! This is a terrible lesson which they are now taught when it is too late. Tocqueville and all the rest of them, in their intense fear and hatred of the Republican party, have been just acting in such a way as to prepare France for that military despotism which now menaces the country."

Meanwhile the history had been progressing volume by volume, and the historian corresponds with Lewis on difficult passages of Thucydides, e.g. on φιλοκαλοῦμεν μετ' εὐτελείας, which he took to mean, "our poorest citizens have a keen relish for fine poetry, eloquence, art, and grace of every kind." Perhaps it would be truer to say that the Athenian loved artistic beauty irrespective of the cost and the material. Shilleto had criticised some of the notes on passages in Thucydides, and Professor Grote of Cambridge replied to his somewhat sharp attack. Colonel Mure also put forth a criticism on the account of the early chronology, but in a much fairer tone. Nor did Grote limit himself to his Greek authors. His fondness for Tacitus and other Latin writers is visible in almost every page. And he would illustrate the views of the early Greek race by reference to Sleeman's account of Oude; and the outbreak of religious feeling at Athens (when the statues of Hermes were mutilated) by the outbreak of fanaticism at Abbeville in France in 1766 when a crucifix was damaged. After another visit to Paris he writes still more despondingly as to the French—"Nothing strikes me more than the excessive alarmism and political cowardice of the French people; no one seems to have an idea that he has any power of defending himself, nor does he think himself safe unless soldiers or gendarmes are within call." At last the twelfth volume was finished, and "I remember that I had a bowl of punch brewed at Christmas for our little household, in celebration of the completion of the opus magnum; Grote himself sipping the delicious mixture with great satisfaction whilst manifesting little emotion outwardly, though I could detect unmistakable signs of inward complacency as I descanted upon 'the happiness of our living to see this day,' and so forth." It was indeed an "opus magnum," and will remain the political history of Greece, though the works of Curtius and others may prove more attractive in some respects on the side of art and literature. Possibly Grote at one time intended to have written a chapter on Pindar and the lyric poets as a pendant to his account of Athenian literature, and a tribute to the intellectual powers of the rival race, but such a chapter does not exist. The famous chapters on Socrates and the Sophists may have turned his attention to philosophy again, and he resumed the studies of his early years on Plato and Aristotle with great zest. He unfortunately did not complete the account of Aristotle's Political writings, which would have been most valuable to us; the analysis of the Logical works is not perhaps of equal interest to the reader. And possibly Plato ought to be commented on by one who is not an opponent; Grote judges him from the point of view of the opposite school. He accepted too the common Alexandrian list of Plato's works in a somewhat uncritical manner. J. S. Mill writes: "I hope you have seen Mark Pattison's review of you in the *Reader*. He contests the question of the Platonic canon with you, or rather promises to contest it. I was pleased however to find him so eulogistic of the book in every other respect." It is characteristic of the subsidence of the angry political and educational warfare of the days of the Reform Bill that Grote in

his later years enjoyed going to Oxford, which was perhaps a little ashamed of the way it had once treated London University and of its squibs against the Liberal thinkers. Grote's antagonism to the governing classes too, learnt under James Mill, who had suffered from the painful experiences of a very different epoch, had now disappeared, and he enjoyed the society of many of our most distinguished men. He was even offered a peerage, but he refused it on honourable and conscientious grounds, as he "could not perform the public duties incumbent on members of the House of Lords." From another visit to Paris we have an anecdote of M. Thiers, who said to a friend as early as 1869, "My whole life has been passed in antagonism with Republican doctrines—well, for all that, I have of late come to think differently. In plain terms, I am now profoundly persuaded *qu'il n'y a rien de possible que la République*."

Almost the last work which Grote did was the paper on Aristotle's *De Anima*, which he generously contributed to Bain's book on *The Senses and the Intellect*, and which occupied him for not less than eight months. He was always careless of himself, and twice he caught desperate chills, which were the origin of the insidious malady that proved fatal to him. He died on the morning of the 18th of June, 1871. The abstract we have given supplies only a faint idea of Mrs. Grote's labour of love in writing what is emphatically the *personal life of George Grote*. She has wisely printed as many letters as possible, and very aptly quotes the words used by the biographer of Grote's illustrious namesake, Hugo Grotius—"Ses lettres peuvent être regardées comme des ouvrages. Le recueil que nous en avons est un trésor, non seulement pour l'histoire publique, mais aussi pour l'histoire littéraire." C. W. BOASE.

#### F. VON RAUMER.

ON the 14th June died at Berlin, at the venerable age of ninety-two years, Friedrich von Raumer, the Nestor probably not only of German but of European historians. He had seen the days of Frederic the Great and of the Emperor William I., and had held a government office under Hardenberg in 1810, until, after the expulsion of the French, he took a chair of history first in the University of Breslau and soon afterwards at Berlin. Though granted a dispensation from lecturing a considerable time ago on account of his great age, he used to assemble his pupils regularly till within a few years of his death. I remember that at a dinner given in February, 1867, in honour of Leopold von Ranke, commemorating the day on which that great historian had taken his degree fifty years before, Raumer commenced a long series of speeches by playfully asserting that he considered himself entitled to do so by having constantly been a grateful disciple of Ranke, though his senior by more than fifteen years. Always cheerful and a warm liberal patriot, he contrived as long as he lived to follow the progress of the age with a keen eye. When in his place as secretary of the Berlin Academy he delivered the annual oration on the birthday of Frederic the Great in 1846, he had to endure a violent retort from King Frederic William IV. and his reactionary court, and in consequence resigned both the secretaryship and his chair in that learned body. Two years later he was elected a member of the Frankfurt Parliament, and went as ambassador of the provisional German Government to that of the French Republic at Paris, where Bastide, the foreign minister of the day, received him sneeringly as the messenger of the Frankfurt Empire. His letters from Paris, however, published by himself, will still be read with pleasure on account of their lively contributions to the history of the revolution of 1848. And so will be the reminiscences of his own eventful life, written several years later in a charmingly gossiping strain. His many historical works are more or less distinguished by a great amount of matter drawn from the archives of the most important European governments, which he had visited during his frequent travels. I refer especially to two volumes of contributions from researches in the British Museum and the State Paper Office, referring to the period of Elizabeth and Mary Stuart and to the reign of Frederic the Great, 1836. Three volumes of letters written home from England in 1835 and 1841 found a translator as soon as the originals appeared. Raumer wrote a rapid and easy style, but neither excelled in terseness nor in a systematic application of his sources according to critical rules. He consequently

never founded a school, but constantly attracted a number of friends and admirers. Of all his works the *Geschichte der Hohenstauffen* in six volumes will certainly be best remembered for a good while to come. Although some portions of that mediæval period have since been revised and reproduced by younger and even more competent historians, nobody as yet has come up to Raumer's general sketch and delineation of that grand age—a work which, indeed, was composed in his best time and style. Hardly a year ago the old man truly enjoyed the issue of a fourth and popular edition, which he dedicated to William I., the restorer of the Empire, with whom he had continually been on the best personal terms. R. PAULI.

#### Bullettino della Commissione Archeologica Municipale. Marzo-Aprile, 1873. Roma, 1873.

THIS publication deserves to be better known in England than it is at present, and when known it cannot fail to be highly appreciated. It is the first time that an archæological journal has been issued at the expense of a corporation, and the municipality of Rome has set an excellent example to the corporations of other cities. The *Bullettino* gives an account of the antiquities found from month to month, and the best representations that can be obtained, with the help of photography when necessary. The plates are very satisfactory, and the accounts are written by the best archæologists of the place. In the present number the first article, by the Baron Visconti, and entitled "Ermeracle," relates to the statues of Hercules, with an illustration of one recently found, of which an excellent photograph is given.

The second article is on the fragments of a colossal cornice found on the Viminal near the Prætorian Camp, supposed to belong to the western gatehouse, which the writer of this article attributes to the time of the Gordians. The plate gives an excellent drawing and section and the plan of the camp showing the exact situation where it was found. There was a previous notice of this cornice in a former number of the *Bullettino*, for November, 1872, to which this may be considered as supplementary. Several of these large fragments were found near the same spot, two quite finished, one unfinished, and one nearly blocked out and the carving not executed at all. All were of the same gigantic proportions and evidently all intended for the same building. The impression left on my mind was that they were on the site of the studio of a sculptor, and that the work was never completed; but that is not the opinion of the writer of this article, who gives a view of the gate to which he supposes them to belong. The third article is entitled "Basorilevvo Mitriaco Scoperto al Campidoglio e Tazza Mitriaca," and is accompanied by an excellent engraving of a fragment of sculpture found on the northern side of the Capitoline Hill during the recent excavations in making a new carriage road up the hill on that side (with a view to the removal of the present road on the southern side which crosses the Forum). There is also in the same plate another representation of the same subject from a terracotta circular basin. The article is an extremely learned one on the worship of *Mitra* or *Mithra* by the Cavalieri C. L. Visconti, who is well known to be master of that difficult subject, and he refers to all the best works upon it, German and French as well as Italian. This is followed by an account of a singular brick stamp of the time of Constantine, by the Cavalieri G. B. De Rossi, full of his usual learning and ingenuity, and accompanied by an excellent woodcut. The next article is by the same author, and relates to another singular inscription on a leaden waterpipe found on the Esquiline, near the great agger of Servius Tullius, between the thermæ of Diocletian and the church of Santa Maria Maggiore.

The fourth plate is a plan of the new road up to the Capitol on the north side, as before mentioned, with clear indications of the exact sites of the objects found there. One of these is the cave of Mithra, another a part of the early wall of large squared stones that formed the substructure against the cliff of the hill. There is an excellent paper upon these and other interesting remains, including several brick stamps, by Signor Lanciani, the excellent and active secretary to the commission.

JOHN HENRY PARKER.

#### Notes and Intelligence.

Two months ago Dr. Pertz, forced by the weight of years and increasing illness, gave up his two important positions, viz. the editorship of the *Monumenta Germaniæ Historica* and the governorship of the Royal Library at Berlin. The vacancies have not yet been filled up. We learn, however, on good authority that the *Monumenta* henceforth will not be again entrusted to a single person, but that a Commission of the Royal Academy of Sciences at Berlin is to superintend the continuation of the great collection of authorities for national history. Members of the commission are to be Professor Droysen, the author of the political history of Prussia, Dr. Max Duncker, the first officer of the Prussian Record Office and author of a learned work on ancient history, and Professor Haupt, the well-known philologist. They are expected to attach to their number Professor Wattenbach, who removes from the university of Heidelberg to that at Berlin, and Professor Waitz at Göt-

tingen, both among the first living masters of mediæval historiography and diplomatics. Perhaps Professor Sickel of Vienna, who has investigated the early charters, especially those of the Carolingian dynasty, more scientifically than anybody else, will also be of the number. Since his pamphlet on the *Diplomata Regum Francorum e gente Merovingica*, and since Dr. Stumpf of Innsbruck in the last number of Sybel's *Historische Zeitschrift* (see *Academy* No. 73) reviewed even more severely this last volume of the *Monumenta*, edited by Dr. Pertz, junior, there is no chance left of continuing the editorship in the old rather slovenly way and as a kind of heirloom in the same family.

The hope of inducing H. von Treitschke, the eloquent and patriotic historian of Heidelberg, to accept a chair at Berlin, has not been entirely given up, though he has for the present declined to go. That Waitz would leave Göttingen to fill up a vacancy at Heidelberg is more than unlikely, if not impossible, for many reasons which need not be enumerated here.

A third edition of Wattenbach's very useful book *Deutschlands Geschichtsquellen im Mittelalter bis zur Mitte des dreizehnten Jahrhunderts* has just left the press. Compared with the second, which appeared in 1866, the book has been very much improved and enlarged, so much so indeed that it had to be divided into two volumes, the first of which, just published, reaches only the end of the tenth century. It is at present by far the most popular handbook of all those who wish to approach the study of German and Imperial history with the principal authorities in hand. The wonderful materials of English history, of which Sir Thomas D. Hardy is supplying his magnificent Descriptive Catalogue, very much require some similar condensation and adaptation in connection with mediæval literature and literary progress in general, which certainly would be the task of a good scholar. Wattenbach would serve him fairly as a model.

The first number of A. Potthast, *Regesta Pontificum Romanorum inde a post Chr. n. MCXCVII. ad A. MCCCIV.*, Berlin, Decker, 1873, 4to, appeared a little while ago, a work for which the great prize of the Berlin Academy of Sciences has been awarded. It will be remarked that this collection in continuation of Jaffé's well-known *Regesta Pontificum* commences with Pope Innocent III., considerable fragments of whose register have happily been preserved, which were printed long ago, some portion by Baluze, and another by Bréquigny. A glance of the eye, however, suffices to see what a large mass of documents, once issued from the chancery of this great pontiff, but not contained in either of those editions, may still be gathered by skilful researches.

The German book-trade advertises likewise : A. Potthast, *Bibliotheca Historica Mediævi*, Editio Secunda, Weber, Berlin, to be issued in the course of the summer. This work is sure to be welcomed by many a friend of historical inquiry in England as well as on the continent.

Another instalment of Spruner-Menke's historico-geographical Atlas has been received by the subscribers with a map of the British Isles between the years 1485 and 1830, before railways began to intersect the turnpike roads and canals (No. 61), to which a very instructive sketch of the border land between England and Scotland is appended.

Last not least, a German translation of Mr. James Bryce's excellent book on the Holy Roman Empire by Dr. Arthur Winckler, Leipzig, Ed. Kummer, 1873, ought to be mentioned. It has been revised by the author himself in harmony with a fourth edition of the original soon to be published. Mr. Bryce's German preface concludes with some graceful and warm-hearted compliments to the new empire. In the translation, which reads very well indeed, and which has been received accordingly by a rather sober and critical press, the notes and the chronological tables of popes and emperors have been transferred to the end of the text, a new arrangement which scholars generally do not prefer.

### New Publications.

ARCHIV f. sächsische Geschichte. Hrsg. von K. v. Weber. 12 Bds. 1 Heft. Leipzig: Tauchnitz.

CARTWRIGHT, W. C. On the Constitution of Papal Conclaves. Edmonston and Douglas.

CAYRE, M. l'Abbé. Histoire des évêques et archevêques de Toulouse, depuis la fondation du siège jusqu'à nos jours. Toulouse: Doula-doure.

### Philology.

A Sanskrit-English Dictionary: Etymologically and Philologically arranged with special reference to Greek, Latin, Gothic, German, Anglo-Saxon, and other cognate Indo-European languages. By Monier Williams, M.A. Oxford: Clarendon Press. 1872.

THE chief object which Professor Williams has had in view in preparing his dictionary is to compress into the compass of a single convenient volume the main results hitherto obtained from the lexicographic and exegetic labours of Sanskrit philologists. Such an undertaking, if carried out satisfactorily, must needs confer a very great benefit alike on Sanskrit students and on those engaged in comparative philological inquiries. The want of a work of this kind has indeed been long felt. Professor Benfey's Sanskrit-English dictionary, published in 1866 and consisting of a very handy octavo volume, has no doubt proved extremely useful; the more so as, in spite of its comparatively limited bulk and matter, the author has added references to the greater part of the meanings of words he proposes. Still, though probably including all that the generality of students are likely to require, the volume did not pretend to be more than a kind of manual to a number of works generally used as text-books in junior and middle university classes. Vaidik literature, which is of the greatest interest and importance to comparative philologists, had to be almost entirely excluded. The work of Professor Williams, on the other hand, aims at far greater completeness, as is shown by the copious list of authorities given in the preface, including all the chief editions of Vaidik works and law-books, the epics and the more important works in other departments of classical literature. The statement that "all the mere texts and manuscripts" consulted or drawn upon for information have been excluded from that list, has probably surprised many scholars. For completeness this work would thus have to be compared rather with the great St. Petersburg Sanskrit-German Lexicon of Professors Böhtlingk and Roth, an appeal to which, as the author acknowledges, has always proved "the most satisfactory available means for deciding doubtful questions." A rough calculation of the relative amount of printed matter contained in the two works shows that the St. Petersburg Dictionary, which, when complete, will probably number some 9,000 columns or

4,500 pages, would, if printed in the same close, but distinct, type as that of Prof. Williams, occupy about 2,500 pages, or two volumes not considerably exceeding the bulk of the present volume. Those who are accustomed to consult the German Lexicon, and are, therefore, aware of the vast number of quotations which have been introduced therein to authenticate every meaning assigned to a Sanskrit word, may perhaps find it somewhat difficult to realize this statement. They will, however, on examining the Oxford dictionary more closely, meet with much that is calculated to take up considerably more space than has been assigned to the same matter in the larger work. One feature which is peculiar to Prof. Williams' volume consists in numerous articles, compiled from various sources, and scattered throughout the work, on the literature, mythology, science, and philosophy of the Hindus. The information conveyed in this manner will no doubt prove very useful to the student. Much room is also taken up by an unusual superabundance of the English equivalents of Sanskrit words which, it is to be hoped, will at least save the use of an English dictionary of synonyms to those who venture on poetical translations of Sanskrit originals. Under the word *prāṇīya* for instance the St. Petersburg dictionary quotes five passages for which two German equivalents are considered sufficient, whereas Prof. Williams gives *seven* synonyms.

This dictionary possesses, however, several more conspicuous characteristic features which, as innovations in Sanskrit lexicography, will have to be well considered by those who will hereafter engage in a similar undertaking. The first point to be noticed is the introduction into the alphabetical arrangement of an almost unlimited number of compound words.

"Sanskrit," according to Prof. Williams, "stands eminently forth as the grand typical representative of the whole Aryan line of speech which is throughout distinguished by its love of composition." To exclude compounds from a Sanskrit lexicon would be, so to speak, to 'Unsan-skritize' it. Not only are there certain compounds quite peculiar to Sanskrit, but in the grammar composition almost takes the place of syntax," &c.;

and further on we meet with the following remark:—

"All must agree that as Sanskrit exceeds every other language in its infinite capacity for composition, no Sanskrit lexicon, if it admits compounds at all, ought to treat them as if they were independent entities entitled to a separate existence of their own."

Nobody will probably feel disposed to contest these views, except in so far as it might be urged that a compound the members of which have lost their separate and distinct meanings has certainly a right to be treated as an "independent entity," and as such to appear in its alphabetical order. But so far from the remarks quoted being a vindication of the system adopted in the Oxford dictionary, they would seem to be the very grounds on which a vast number of the compounds exhibited should have been rejected. No doubt the St. Petersburg Lexicon contains a still larger amount of such combinations; the great mass however of these find no place there among the alphabetically arranged words, but *because* "in Sanskrit grammar composition almost takes the place of syntax" they merely appear as so many quotations from Sanskrit works to illustrate the meanings of certain words forming part of these compounds. Does not the very fact of such combinations being exhibited alphabetically only, tend to their being considered as "independent entities entitled to a separate existence of their own"?

It is, however, evident that the majority of compounds admitted by Prof. Williams are really quotations in disguise—quotations, be it remarked, without references—which serve, as he himself tells us, "to illustrate the use of a leading word" "to which they have always been subordinated." But what claim, it may be asked, can the first

member of a compound in such a language possibly possess to being thus exceptionally treated? Are not the cases even more numerous when certain meanings of words can only be adequately illustrated by compounds of which those words form the *last* member? Not that I would advocate the principle followed by Prof. Benfey of giving compounds almost invariably under its last member; although those he has admitted are comparatively much more limited, and generally of a more useful and indispensable order. But surely no student ought to be encouraged to look for such a compound as *Yudhishtira-purogama* under *Yudhishtira* where Prof. Williams places it. Can this be said to have been done in order to illustrate the use of the leading word; and why not give *salyapramukha* and a host of similar combinations in their respective order? Are not compounds such as *ārya-prāya*, *trina-prāya*, *sūpta-jana-prāya* useful illustrations only when exhibited under their last element? In my opinion the indiscriminate introduction of ready-made compounds into a Sanskrit dictionary constitutes a very serious danger to the effectual philological training of the student; and the momentary convenience afforded thereby is sure to turn out to have been only too dearly bought. Again, if anything like consistency is deemed desirable in a work of this kind, a vast number of such combinations could have been with advantage dispensed with. A few days' reading will furnish compounds by thousands which have an equal, if not a better, right to be admitted with many that have been given. The dictionary has *pina-sroni-pāyodharā* and *srasottara-pata*; why not *pina-skandhorubāhu*, *srastakirīṭahāra*, *visrastahārāṅgadachakravāla*, &c., &c. It contains *ari-rāshtra*, *ari-pura*; why not *ari-mandala* (Ragh. iv. 4)? We meet with *pāshāna-chaya-nibaddha*; but Profs. Böhtlingk and Roth under *badh* with *ni* furnish a score of compounds with *nibaddha*, many of which will recommend themselves even more strongly. Prof. Williams admits *drutatarā-gati* from Megh. 20; why not *laghugati* (ib. 16)? he gives *kṛita-sannidhāna*; why not *parikalpita-sannidhi* (Ragh. iv. 6)? Would not a compound such as *un-nayana-pankti* (Ragh. iv. 3) be far more useful, as the student might naturally be led to refer it to the *unnayana* given in the dictionary? In Prof. Williams' opinion, "when a student is in doubt whether to translate compounds like *indra-sātru* as *bahuvrīhis* or *tatpurushas*, the dictionary is surely bound to aid in clearing up his perplexities." Whether the compiler of a dictionary is bound to, or could by *any possibility*, undertake such a task, I must leave to the decision of those skilled in lexicographic research; but the word quoted by Prof. Williams can scarcely be called a felicitous illustration; since, if it proves anything, it is that, in order to clear up some of the student's perplexities, he ought to have marked the accents of Vaidik words. He has indeed gone so far as to enlighten the student on this particular word by explaining it to mean "whose enemy or conqueror is Indra, conquered by Indra (with the udātta on the first syllable; differently accented the word might mean 'an enemy of Indra');" but are there not many other cases in which information of this kind would be quite as useful? Should not, for instance, the noun *āpas*, work, be distinguished in a dictionary from the adjective *āpas*, active?

The alphabetical order of words has been partially abandoned by Prof. Williams for a kind of etymological arrangement. From the preface to the second edition of Wilson's dictionary it appears that it had been the intention of that scholar to offer to the public "a work constructed on an entirely different model, and one better adapted than a mere alphabetical compilation to learned and philosophical research." The plan alluded to consisted, as we now learn from Prof. Williams, in a re-arrangement of all the words

under roots, according to native principles of etymology, with numerous references added to them. The task of preparing a dictionary on the plan sketched out by Wilson was not, however, given up entirely, but was in later years entrusted by him to Prof. Williams, to whom he likewise made over "a copious selection of examples and quotations made by the Pandits of Calcutta, under his direction, from a considerable range of Sanskrit literature." On the other hand, the late Prof. Goldstücker, as is well known, undertook to bring out a third revised edition of the Alphabetical Sanskrit Dictionary. But as it soon became manifest to Prof. Williams that the last-named work "was assuming almost interminable proportions," and that the St. Petersburg Wörterbuch also "appeared to expand into vast dimensions,\* so as to be quite beyond the compass of ordinary students, he suddenly determined to abandon the design of a wholly root-arranged dictionary—which could only be useful, like the works above-mentioned, to the highest class of scholars—and to commence a work on a more practical plan." There can be no doubt that a dictionary arranged etymologically throughout, though useful to a certain class of scholars, would have been of little practical use to the Sanskrit student unless an alphabetical index of almost the entire stock of Sanskrit words were added to the work for reference. Whether, however, the middle course followed in the Oxford dictionary will, as Prof. Williams thinks, satisfy the requirements both of philology and of ordinary practice, is by no means unquestionable. Can it really be said that the comparative student gets a satisfactory "synoptic view" of the various "family groups" of Sanskrit words when *bhava* (and the partic. *bhavat*; p. 702) and *bhāva*, &c. (p. 707), are separated from the root *bhū* (p. 714); when the group given under root *bhuj* (p. 713) includes *bhoktri*, but neither *bhoga* nor *bhoja* (p. 723)? What can be the principle on which *sodha* (the alphabetical order of which would be in p. 1021) is placed under *sudh* (1014); on which *teja* and *tejas* (p. 383-4) are not given under *tij* (p. 373); though *kīrti* (which alphabetically would stand in p. 231) is placed under *kṛt* (p. 252). Cases of this kind of inconsistency are not isolated, but are to be met with on almost every page.

Not less difficult is it to ascertain the exact class of Sanskrit students, whose convenience this arrangement is likely to serve. The dictionary does not, nor is it intended to, satisfy the requirements of the advanced student. Without references no scholar can be expected to accept meanings another may choose to assign to Sanskrit words. In numerous cases a certain meaning of a word rests on one or two passages which may either be corrupt or bear a different interpretation. To mention a few examples from common text-books. When Prof. Williams tells us that *anvāsita* means "made to sit down after or alongside," a reference is needed; for if this interpretation is meant to apply to Ragh. i. 56, it can hardly be the right one, and is certainly not borne out by the comment. When *āropyamāna* is said to mean "being strung, being tried to be strung," the student requires to be told whether he is thus to translate the word in a certain passage of the Mahābhārata (i. 7032), where the commentator (and Prof. Johnson) takes it in an active sense, "stringing, wishing to string." If *sahasā* means "with," does this rest on Mah. i. 7011 alone? If so, the meaning is doubtful, as Prof. Benfey in his dictionary has done well to indicate. Under *anantaraja* it might have been stated that Kullūka's explanation of the term (M. 10, 41) differs from that given in the dictionary. When *riksha* is said to mean "the seven

stars, the *Pleiades*," this is probably a mis-translation of Messrs. Röhrling and Roth's "Siebengestirn," which in German is the common designation of the Pleiades, but is in this case applied more correctly to *Ursa major*, as it might of course be used for any constellation consisting of seven stars. To the ordinary Sanskrit student the arrangement of the dictionary will, I fear, be far from convenient. While offering too little to the comparative philologist, it exacts from those it is to assist in toiling through the common run of texts far too great a knowledge of the stock of roots and the formation of Sanskrit words. With them looking for a word will often be a matter of "hide and seek." Can the student be fairly expected to know that in order to find the proper noun *dāmodara* he has to look for the particular word *dāman* (one of three) which belongs to one among five identical roots, viz. *dā* "to bind"? Where a word may have been omitted in the dictionary the conscientious student will hunt for it, column after column, and in giving up the search will mistrust his own discernment rather than suspect a mistake on the part of the compiler of the dictionary. Thus a student desirous of reading the fourth book of the Raghuvamśa was sorely puzzled where to find the word *pradhūmita* occurring in the second verse. For these and other reasons the alphabetical order can scarcely be dispensed with in a Sanskrit dictionary which is to benefit the ordinary Sanskrit student. Still, there is no reason why lists of derivatives should not be added to the roots and even to primary bases. This would be decidedly useful, and could hardly be considered to involve an increase of bulk where space might have been economized in so many ways. What occasion can there be for giving in the alphabetic order so great a number of participles and gerunds, often explained by a profuse display of English equivalents which naturally follow from the meanings of the roots? And why should *ānamita*, *ānamya*, *ānāmya*, *unnamita*, and *unnamayya* be thus admitted, whilst *avanamita*, *avanāmīta*, *avanamya*, *avanāmya*, *ānāmīta*, *unnamīta*, *unnamya*, *unnamāmya*, &c., are excluded?

The amount of space accorded to such verbal forms is the more considerable on account of another prominent feature of Prof. Williams' dictionary, viz. that of separating from the simple roots their combinations with prepositions and introducing them into the alphabetical arrangement. Prof. Williams asks "why Sanskrit lexicons should not have been brought into harmony with Greek in this respect long ere this." But has such an innovation ever been thought desirable in the interest of philology or even as being more convenient to the Sanskrit student? The transparency of Sanskrit formation has enabled the philologist to trace the chief primary elements of Indo-European speech in those simple combinations of sounds expressive of certain general conceptions: why should anything be devised that might tend in any way to obscure this fact? The Greek lexicons exhibit the first person singular of the present tense: but surely, if any change were thought possible and advisable to bring the two languages into harmony in this respect also, it would not be in Sanskrit. Even in dictionaries of dialects which are intimately connected with Sanskrit, but have undergone much decomposition, such as the Pāli, it would probably be impossible to copy in every particular the model of Sanskrit formation—for who without committing gross injustice could assume *rājan* to be the base of a word which has *rañño*, *rājassa*, and *rājino* for genitives?—and the adoption of the Sanskrit root system, however convenient to Sanskrit scholars, may possibly be outweighed by inconveniences of other kinds. Another manifest advantage of the method hitherto followed in Sanskrit dictionaries is the

\* See however what has been said above.

"synoptic view" we thereby gain of a verb and its combinations with prepositions; while at the same time considerable space is saved by getting rid of a continual repetition of grammatical forms. No doubt the labour involved in this process of re-arranging the verbs must have been very great; the more so as the assistance which Prof. Williams has derived from the work of Profs. Böhrling and Roth must, from the very beginning, often have failed him in this respect. Take, for instance, the root *nam*. The fasciculus of the St. Petersburg dictionary containing that verb with its compositions was published some ten years before Prof. Williams' work. The native authorities state that in the causative form this root may optionally lengthen its vowel, but, when used with a preposition, must remain short. Prof. Williams, however, under *nam*, states the rule thus: "caus. *namayati* and (with prep.) *nāmayati*." In turning to its compositions, we find, in accordance with this view, the causatives *ava-nāmayati*, *ā-nāmayati*; but with *ud*, *un-namayati*: yet Messrs. B. and R. had furnished examples of both the short and long vowels for each of the three verbs. With *sam*, *vi*, &c., Prof. Williams, in conformity with his predecessors, gives both forms. The only conclusion we can draw from such a comparison is that the printing of the Oxford dictionary must have begun many years ago. A few remarks on this point would have explained why, for instance, the causatives of *adhi-vas* and *ni-vas*, to which Messrs. B. and R. assign four and three different meanings respectively, are entirely wanting.

One more peculiarity of Prof. Williams' dictionary remains to be noticed: the partial employment of the Roman character with diacritical marks. On this point the preface contains a lengthy digression characterized by the most sanguine expectations as to the gradual propagation and eventual supreme rule of our alphabet, together with various contrivances of stops, points, and other marks. There may not however be wanting those to whom the adoption among European scholars of a common transcription seems a dream less likely to be realized than the reunion of the various Christian sects. All that can be said at present is, that almost every Sanskrit scholar employs his own peculiar system of transliteration; nay, that most of them have at various times made use of two or three different systems, and may be prepared to invent and adopt a fresh one at a moment's notice. Those who read Prof. Williams' remarks will probably remember that a different method of transcription is used in his Sanskrit grammar; and being told that, if he "had dared to innovate further," he would have written *k'* for *kh*, &c., they may be pardoned for being less confident on the matter. Many of those, however, who have the extension of the "Indo-Romanic" alphabet at heart must have been surprised to see that, in spite of the varied resources of our typography, such as capital letters, italics, "to say nothing of Egyptian and other forms of European type," Prof. Williams has chosen to employ the Devanāgarī character in order to bring prominently before the eye the roots and the leading words of groups of derivatives. This continual change of the two kinds of type can hardly be said to have a beneficial effect on the eye in running over the pages. Many also will probably object to the use of the Roman character in a dictionary as being far from convenient as long as so many different systems of transliteration are in vogue. In consulting the dictionary whilst reading a text printed according to any of those systems, the Devanāgarī form of the word will still readily suggest itself to the mind's eye; but in so doing, to have to translate, as it were, from one method of transcription into another is very far from pleasant. If it is considered too great a trouble for the general student to master the "intricacies" of the

native character, by all means let the European, in what transcription soever, be printed along with the Nāgarī word; but let the latter stand first for him who requires the dictionary in reading Sanskrit texts. That the Nāgarī takes up more space remains still to be proved; but even if it were so, ten times the amount of space might be saved by omitting the numerous *pūrva-padas* of compounds, not to mention other expedients. If one point seemed of late to have been generally agreed upon in transcribing, it was that of marking long vowels with the circumflex, since the horizontal line has to be used for prosodial purposes and the accent is required for Vaidik words. Evidently, however, this also is as much as ever a matter of choice, since in the dictionary the horizontal line has again been made use of by Prof. Williams, whilst in his grammar the accent is used for the same purpose. In order to show that a Sanskrit-English dictionary gains in clearness of arrangement by freely using the Roman type, it is hardly fair to compare this dictionary, as Prof. Williams does, with that of Sir Rādhākānta Deva, a work wholly in Sanskrit and printed in the Bengali character: Wilson's dictionary and the St. Petersburg one will readily bear a comparison in this respect.

Prof. Williams has introduced into his dictionary abundant comparisons from cognate languages, on the authority of Bopp and Profs. Benfey and Curtius, "subject to the understanding that more recent views have been propounded on many points."

In concluding these remarks it is but fair to add that, whatever may be the opinion regarding some of the principles on which this dictionary is based, there can be no doubt that the meanings of the words have been admirably arranged, and that a great amount of labour, and that of the most useful kind, has been bestowed on the work. A second edition, which may probably become necessary after the completion of the St. Petersburg Lexicon, might with comparatively slight trouble be made all that the English Sanskrit student is likely to require. J. EGGEING.

Notes de Critique et d'Exégèse sur Horace. Sixième Satire du premier livre, par P. Willems. Bruxelles. 1873.

THIS brochure analyzes a difficult satire and propounds some new interpretations of it. Critically speaking it is more interesting as exhibiting side by side the numerous opinions of old and new commentators than convincing in the views which the author himself adopts. M. Willems observing that Horace, after first stating that Maecenas differs from the people in not estimating men by the nobleness of their birth, selects as an example Laevinus, a worthless aristocrat who had been rejected in the comitia by the people; and then immediately afterwards (vv. 19, 20) declares that the same people, if they had to choose between Laevinus and a *novus homo*, would prefer the former; seeks to remedy these contradictions by punctuating with Prinz and Dziatzko after *licuisse*.

"Contra Laevinum, Valeri genus, unde superbus  
Tarquinius regno pulsus fugit, unius assis  
Non unquam pretio pluris licuisse. Notante  
Iudice quo nosti populo, qui stultus honores  
Saepe dat indignis, qui famae servit ineptus,  
Qui stupet in titulis et imaginibus, quid oportet  
Nos facere a vulgo longeque remotos?"

*Notante* introduces an opposition, "Mais quand c'est le juge que tu connais qui nous apprécie; ce peuple stupide . . . alors que convient-il de faire à nous autres, que le vulgaire repousse loin, très-loin?" It would, we think, be impossible to find a more violently harsh interpretation: *Notante* loses its proper meaning of censure, and a sense is given to a

*vulgo longe longeque remotos* which is without parallel in Latin. M. Willems however, satisfied with the logic and not distressed by the Latin of his interpretation, proceeds to alter *esto* into *est : ei*,

"Namque est : ei populus Laevino mallet honorem  
Quam Decio mandare novo,"

which he thus explains : "Et en effet, cela ne souffre aucun doute, le peuple préférerait confier une magistrature à ce Lévinus plutôt qu'à un *homo novus*." Whatever may be said of this correction on palaeographical grounds, we are confident that no one will accept it on that and its logical merits : to say nothing of the extraordinary sense thus given to *est*, Horace, we may feel sure, would not begin a clause with the unemphatic *ei*, even if, which is very doubtful, he allowed it to be scanned as a monosyllable.

M. Willems has another correction, v. 122,

"Ad quartam iaceo, post hanc vagor aut ego lecto  
Aut scripto quod me tacitum iuvet unguor olivo,"

he reads *lego* for *ego* : this is at least ingenious, though not much in the ordinary manner of Horace.

The discussions which the author introduces are interesting and good ; that on the vexed line

"Ibant octonis referentes Idibus aera,"

though it does not prove that the other reading

"Ibant octonos referentes Idibus aeris,"

was what Horace wrote, makes it probable ; at the same time that the supporters of the other view are not bound to give up to M. Willems' arguments their interpretation of Martial's epigram x. 62 as indicating a four months' vacation, or at least a vacation which began in July and ended in October.

M. Willems' view that the sixth satire, which in our MSS. follows the journey to Brundisium, was written in consequence of the jealousies roused by Horace's intimacy with Maecenas as shown by that journey, is plausible : and if he is right in concluding that the date of the satire is 718, when Horace was in the 29th year of his age, it may well be that the poet wrote it partly as an answer to those of his friends who had urged him to stand for the quaestorship, which was now open to him, as having attained the *aetas legitima*. This certainly gives a point to the repeated allusions to the *latus clavus* and *calceus*, those marks of senatorial rank to which the quaestorship was the natural mode of entry : as well as to the language of the two last lines,

"His me consolor victurum suavius ac si  
Quaestor avus pater atque meus patruusque fuissent."

The view is, we believe, original, and, like all other points connected with Horace's personal history, interesting.

R. ELLIS.

### Correspondence.

To the Editor of the ACADEMY.

SIR,—A paper of mine was read in November last before the Society of Biblical Archaeology entitled "A n conjugation such as exists in Assyrian shown to be a character of early Shemitic speech, by its vestiges found in the Hebrew, Phœnician, Aramaic, and Arabic languages." By Richard Cull, F.S.A. The paper will be published in the forthcoming volume of the *Transactions* of the Society, but a few copies of it have been struck off for my private use. Mr. T. K. Cheyne has somehow obtained sight of a copy, and has written an article upon it, which appeared in the *Academy* on the 14th June. The aim of my paper is to show that certain well known, but exceptional forms, hitherto unsatisfactorily explained, in the Hebrew and its cognate dialects, are vestiges of a T conjugation such as exists in Assyrian. A new explanation of these forms by the application of a comprehensive principle is a subject likely to interest Shemitic scholars. The difficulty of rightly

interpreting facts is well known both to students of nature and to literary men, and therefore my interpretation is a fair subject for discussion. Mr. Cheyne begins his article by a charge of injustice against me, but for which I should have allowed his misrepresentations to pass into oblivion. I claim to justify myself from this charge.

It is a known historical fact that the earliest announcement that "the medially augmented forms" in the Assyrian must constitute distinct conjugations was made by the late Dr. Hincks in the *Journal of Sacred Literature* in April, 1856, p. 153 ; and that Dr. Oppert's forms and nomenclature of them were published in 1860. These dates are important, because they prove the impossibility of an explanation of the forms, as I have explained them, before the year 1856. In the year 1868 the Assyrian Grammar of M. Menant was published, and also the second edition of that of Dr. Oppert, and both grammarians state the n (T) conjugation to be peculiar to the Assyrian. Now if my view had been proposed by any scholar before the publication of those grammars, it is obvious that those eminent men either would not have made those statements, or else would have justified them. Mr. Cheyne misrepresents the doctrine of the T conjugation in Assyrian, or he attributes to me the maintenance of one differing from what is accepted by Assyrian scholars—"By a t conjugation he (Mr. Cull) means a secondary verbal form, produced by the insertion or prefixing of a t." This statement is simply untrue. My doctrine is that accepted by Assyrian scholars as laid down by Drs. Hincks and Oppert, and which is briefly stated at the opening of my paper. The medial augment consists of a T, or of a syllable beginning with T, which is inserted between the first and second radicals, but in concave stems it is prefixed to the first radical. This is very different from the doctrine attributed to me and to other Assyrian scholars by Mr. Cheyne.

The doctrine of the T conjugation as laid down by Hincks, Oppert, and Menant is true as far as it goes, and being accepted by Assyrian scholars is taken as the basis of my paper, but it does not embrace all the known facts. Other than concave stems have the T prefixed ; such stems abound in Hebrew, but not in Assyrian, and in treating of those stems I have named my friend Mr. Sayce as the only writer on Assyrian grammar who has drawn attention to them. This reference to Mr. Sayce is stated by Mr. Cheyne to be "strangely inaccurate." Again Mr. Cheyne's statement is simply untrue. Mr. Cheyne is evidently a careless reader, so that he misunderstands what is written, and a man who misunderstands may unwittingly misrepresent. He calls me Dr. Cull, but the title of Dr. is not on my title-page, and has never been adopted by me. He carelessly read my name and misrepresents it. He calls me a blind idolator of Fürst, but he has read so carelessly as to be unaware that I have differed from Fürst in almost every quotation from him. Mr. Cheyne says that I promised an "investigation into all the Semitic dialects" : this again is simply untrue, and doubtless due to his careless reading. Mr. Cheyne says, "The pointing of the Hebrew is occasionally faulty ;" if so, it is a less scholarly blemish than writing מרשע for מרשע, which my censor has done. I have now done with Mr. Cheyne, and trust that in future he may read carefully and endeavour to understand the work he desires to write upon before he puts pen to paper.

RICHARD CULL, F.S.A.

25th June, 1873.

To the Editor of the ACADEMY.

SIR,—I have no wish to provoke further misunderstandings, and will therefore be as short as I can in my reply. I trust Mr. Cull may some day come to know me better. Allow me to remark that in the article referred to I expressly recognised his merits as a developer, though not (here at least) as a discoverer, and that I am not unaware of his high attainments as a linguist. It is due however to myself to state that my criticisms, whatever be their value, were made after a most careful perusal of the essay, and that I still adhere to them in substance. I will touch upon each of the points raised by Mr. Cull in order.

1. Writing with but few books about me, I am unable to verify Mr. Cull's references to M. Oppert and his follower M. Menant. I can only say that if they have asserted this kind of "conjugation" to be peculiar to

Assyrian in the natural sense of Mr. Cull's essay, they have made a slip of which the veriest tyro ought to be ashamed. 2. All compendious statements are liable to be misunderstood, but I do not see that mine (as to the meaning of T "conjugations") is dangerously so, or that it misrepresents the received opinion of Assyriologists. 3. Let any one read the passage in Mr. Cull's essay relative to Mr. Sayce's Assyrian Grammar, and decide. My statement was made deliberately, and I am quite at a loss to understand how any other view of the passage is possible. Of course I admit Mr. Cull's explanation of what he intended to say, though I fail to reconcile it with another passage quoted by me in my article from page 17 of the essay. 4. It seems to me that the greater part of Mr. Cull's philological material in this essay (except of course the Assyrian) is derived from Fürst, and very many scholars will agree with me in regarding what proceeds from Fürst with some suspicion. And I cannot help thinking that Mr. Cull's deductions from that material are more influenced by Dr. Fürst than he is himself aware. Still I wish it had occurred to me to substitute for "*blind idolatry of*," which now seems to me several shades too strong, the milder expression "*undue respect for*" (Dr. Fürst). 5. I hardly think the phrase "*all the Semitic dialects*" could have been misunderstood by any one who had read my first sentence. "*All the dialects*" of course means all those which are known well enough for the purposes of the inquiry. That the treatment of Phœnician, Aramaic, and Arabic (including, as it is fair to do, Ethiopic), at least, is perfunctory, will hardly, I imagine, be denied. 6. Mr. Cull forgets to add that I expressly attributed the occasional mispointings to his printer; why does he not extend the same courtesy to me in a more trivial because more obviously accidental instance? 7. I am sorry I was misinformed as to Mr. Cull's titles. It is curious that Mr. Cull should style M. Jules Oppert (as I think that eminent scholar always writes himself) Dr. Oppert.

I am tempted to add, I have done with Mr. Cull, but I trust on the contrary to derive much instruction from his future researches. I will only express the hope that he may add to his other specialities these two—the power of expressing his own meaning correctly, and a trifle more modesty.

T. K. CHEYNE.

### Notes and Intelligence.

It is a proof of the zeal with which philological studies are now pursued in Leipzig, that a mere exercise for a doctor's degree should have developed into such a thorough and scholarly treatise as the *Studien üb. Indogermanisch-semitische Wurzelverwandtschaft* (pp. 119), by Friedrich Delitzsch. It opens, as a German dissertation is bound to do, with a historical sketch of previous researches into the affinities of the Indo-Germanic and Semitic languages, beginning with Guichard (1606), Thomassin (1697), and Court de Gébelin (1774). But such a number of suggestive criticisms are incorporated into it—we may mention especially those on Ascoli, R. v. Raumer, and Renan—that even an English reader forgots his customary impatience of a sometimes injudicious exhaustiveness. The method and the object are defined more precisely in the next section. The true starting-point for all comparisons of the two families of languages is the primitive speech. We must go back to the time when there was but one Indo-Germanic and one Semitic language, and inquire (1) whether the grammatical systems of the two primitive languages, in spite of their deeply-seated differences, cannot have grown out of one common germ, and (2)—the point on which the solution of the problem depends—whether there is not a sufficient number of common roots, which exclude every other explanation of their agreement, to convince us of the affinity of the two families of language. The grammatical question is but cursorily treated, but the apparent inconsistencies of M. Renan in his *Histoire des langues sémitiques* are placed in a clear light. It should be added that Assyrian and Egyptian researches are dispensed with by our author as unfruitful for the lexical part of the problem. In the third section, the writer proceeds to an investigation of "roots," carefully defining the sense in which he uses that word. The difficulties of comparing Indo-Germanic with Semitic roots are fully admitted, but shown to be not insuperable. Roots with one and with two consonants, and even roots with but one vowel, are, according to the writer, obtainable in both linguistic families. The root-determinatives of the one are then compared with those of the other, and shown in not a few cases to be the same. Five reasons are given for rejecting Fürst's and Franz Delitzsch's theory of prepositional prefixes. Thus the possibility of Indo-Germanic and Semitic root-affinities is established to the writer's satisfaction. To convert this into a reality, a comparison of Indo-Germanic and Semitic roots is instituted, based upon fixed

phonetic laws, which are embodied in a comparative table on p. 82. Dr. D. contents himself with establishing the two first laws relative to the *k* and *g* sounds. If his main results are approved, he is prepared to carry his researches further. At present he offers us 100 roots (a number which, he says, might easily be increased) which as well in their sounds as in their fundamental significations agree to such an extent in both fields of language that even, if single comparisons should have to be abandoned, yet on the whole a mutual relation must be recognised, which excludes the possibility of accident. We refrain, unconvinced as we are, from a criticism, which at the present moment could only be fragmentary, and content ourselves with emphasizing the fact that the inductive method has been applied by Dr. Delitzsch the younger with greater firmness than by any of his numerous predecessors.

We learn from the *Jewish Chronicle* that the first part of a commentary on the Talmud may be expected from the pen of the most venerable of Talmudists, Dr. Frankel, of Breslau.

The comparative statistics of the German universities during the current summer term show the same increase at Leipzig and a further falling off at Berlin, the former being attended by more than 3,000, and Berlin by considerably less than 2,000 inscribed students. Places, too, like Bonn, which formerly used to be the favourite resorts of the academical youth, have lost their charms, not merely on account of high and extravagant prices prevailing there, but owing to a kind of fashion and impulse among the young men themselves. Nevertheless it is a good sign, that many of them prefer the more quiet abodes of learning and instruction. Hence the various faculties at Halle, Tübingen, Göttingen, and even at Strassburg so recently founded, not only keep up against the Leipzig monopoly, but continue to advance steadily in quality and quantity from one term to another.

Mr. R. Ferguson has lately published a glossary of the Cumberland dialect under the title of *The Dialect of Cumberland*. The work contains a good deal of useful material, whose value is unhappily greatly impaired by its thoroughly vicious and unscientific treatment. Not the slightest indication is given of the actual pronunciation of the words, and the greater part of the book is taken up by random etymologies, in which the established laws of sound-change are utterly ignored. Thus the author incidentally identifies the Scotch *cummer* with the Sanskrit *kumārī*! When will our dialectologists learn that the parade of etymological knowledge or ignorance, as the case may be, is quite a secondary consideration? Their main business is to give a faithful and full representation of their dialect as it exists, writing its sounds on some definite phonetic system, and giving copious illustrations of the shades of meaning of every word, especially of the commonest words, which are too much neglected in most dialectic glossaries. When they have done this, let them etymologize as much as they like.

Professor March inquires, in the *Transactions of the American Philological Association* (1872), Is there an Anglo-Saxon Language? The drift of the paper is to combat the present tendency of English philologists to discard the name "Anglo-Saxon" altogether as the designation of the earliest stage of the English language, and substitute "Old English" or some equivalent designation. Prof. March insists strongly on the very distinct characteristics of Anglo-Saxon and modern English, remarking that "a German can read it more easily than an Englishman," which is perfectly true. Indeed, it may safely be said that no one has ever obtained a critical mastery of A.S. who approached it from a purely modern English point of view. But we must say that Prof. March has greatly exaggerated the distance between the two stages. Thus he makes the diphthongization of *i* and *e* an essential distinction, forgetting that the change is not older than the sixteenth century even in the literary language. Prof. March admits that the changes have been gradual and have formed an unbroken chain, but contends that the literary periods are sharply defined. Whether or not we accept Prof. March's conclusions, we cannot but agree with him in reproaching the present chaotic nomenclature, which includes both Chaucer and Alfred under "Old English": if a reform is to be made, it must be consistent and systematic, and general adoption must be secured for it.

The French Radicals do not seem to tread with quite so sure a footing upon the field of science as on that of politics. In a recent biography of the members returned to the National Assembly at the elections of April 27th M. Lokroy is said to have accompanied M. Renan to Syria in the capacity of private secretary, and when there "il déchiffrait des inscriptions Sanskrites comme s'il avait pâli toute sa vie sur les hiéroglyphes" (!).

We understand that the next number of the excellent *Revue Celtique*, conducted by M. Gaidoz (beginning the 2nd vol.), will be out at the beginning of August.

### Contents of the Journals.

*Journal Asiatique*. Avril, 1873.—Note sur deux Inscriptions Nabatéennes; par M. E. Renan. [The first of these inscriptions found at Um-er-Russas has already been published in the Quarterly Statement for March-June, 1870, of the Palestine Exploration Fund.

That facsimile was, however, as M. Renan says, very unsatisfactory, and made it impossible for the lamented Dr Levy to arrive at a correct interpretation. M. Renan has received from M. Ganneau an excellent rubbing and translates as follows: "This is the tomb of Abd-Malkou, son of Obeisu, the stratege, which Iameru, the stratege, his brother, has caused to be built for him." The second inscription was published in 1851 at Naples, where the original is at present. The document was first deciphered by Prof. Gildemeister, and again by Levy. M. Renan now proposes some new readings.]—*L'inscription de Dibon*; traduite et annotée par M. Ch. Bruston. [Proposes a number of new readings and interpretations, criticizing those hitherto given.]—*Un Commentaire Samaritain inconnu*; deuxième appendice à la Chronique Samaritaine; par M. Ad. Neubauer. [Extracts from a commentary on Genesis i. to xxviii. 10, composed by a Samaritan in A.H. 445 (A.D. 1053), which Dr. Neubauer believes to be of some interest, as probably being one of the oldest known to have been written by one of that sect. The MS. has lately been acquired by the Bodleian Library.]—*Nouvelles et Mélanges*: Communication de la traduction d'une inscription bilingue; par M. J. Oppert.—*Inscriptions idéographiques de Hama et d'Alep*; par M. Clermont-Ganneau.—Review (favourable) of Vambéry's *Ugourische Sprachmonumente und das Kudatku Bilik* (M. Pavet de Courteille); and notices (by M. J. Mohl) of *Nouveau testament de N. S. Jésus-Christ, version arabe*; à Mossoul; Capt. Burton's *Unexplored Syria*; and Dr. G. Bühler's Catalogue of Sanskrit MSS. Fasc. iii.

## General Literature.

*Poésies Inédites de Lamartine.* Paris: Hachette et Cie. 1873.

THE publication of posthumous poems is not, as a rule, likely to satisfy any but critical desires. Except in the case of a poet's sudden death it is not probable, that work of any great value will be found among his manuscripts, and the probability becomes very small indeed when the poet has reached, and almost exceeded, the utmost limits of human life. But the interest if not the value of the volume before us does not depend entirely upon the specimens of Lamartine's own work which it contains. For it opens with a preface or rather a preliminary dissertation by M. Victor de Laprade, which is not likely to pass unnoticed by persons of combative tendencies. M. de Laprade is of course entitled to the possession of his opinions, perhaps also, as an academician and a not unsuccessful follower of Lamartine himself, to the expression of them. If therefore it pleases him to call his master "le premier représentant de la grande poésie dans notre littérature, et peut-être dans toutes les littératures de l'Europe," we, who do not exactly take this view, can pass the statement by without further comment. But when he proceeds to assert that "les âmes d'aujourd'hui seraient plus difficiles à déraciner de la terre, que celles des premiers lecteurs de Lamartine," and to claim as a special subject of pride for his own generation that they understood and adored the author of the *Harmonies*, it becomes necessary to protest against such a violation of some of the plainest and justest canons of criticism. No man who has reached a certain period of life is a fair judge of the poetry which coincided with, perhaps produced, his own intellectual development; still less is any man entitled to assert that the poetical taste of one age is better or worse than that of another, merely because the subjects whereon that taste was exercised were different in character. The dates of the pieces contained in this volume are scattered over a long period of years, the latest being some half century younger than the earliest. Two tragedies, one complete, the other unfinished, fill more than half the book. They appear to have been written in succession during the autumn of 1813, and so are almost contemporary with the beautifully engraved portrait which does duty as frontispiece. The completed

piece "Médée" is certainly a creditable performance of its kind, and interesting in respect of its versification, on which subject more will have to be said presently. It is executed in the approved fashion, with the due allowance of confidants and a proper absence of horrors on the stage, but the conception is feeble and unworthy of the subject. Two most unjustifiable and unfortunate liberties are taken with the fable, Athens being substituted for Corinth as scene, and the play ending with Medea's declaration, "moi je meurs." The mighty sorceress, part goddess part demon, instead of dismissing as a tale that is told the episode of her passing subjection to jealousy and other human passions, succumbs to these passions like an ordinary woman, and betakes herself to the commonplace refuge of suicide. This is not the Medea of Euripides.

Passing over the unfinished "Zoraïde," we come to the most interesting part of the volume, the plan and a remarkable fragment of the huge projected epic "Les Visions," whereof "Jocelyn" and the "Chute d'un Ange" are only episodes. Lamartine's own account of the origin and development in his mind of the idea of this poem partakes somewhat of the manner of Rousseau, and suggests certain painful doubts as to the exact amount of truth which it may contain; and the plan is an evidently impracticable one. Independently of its gigantic dimensions, the history of the world, poetically represented in that of a superhuman being condemned to a succession of human existences and liable to ultimate restoration or condemnation, is hardly a manageable or promising subject. But the fragment here printed is certainly an admirable specimen of the poet's work at its best. Narrative poetry was undoubtedly Lamartine's forte; indeed in this department he has neither superior nor rival as far as France is concerned. For narrative requires rather a happy co-ordination of faculties than great supremacy in any one particular, and is peculiarly suited for the display of a melodious if somewhat monotonous style. The scene of the fragment is laid on the banks of the Lake of Geneva during the Crusades. An ancient crusader, Béranger, rules his vassals, passes the time in knightly amusements, and brings up as page and foster-brother to his only daughter Hermine a mysterious foundling, who arrives in an ark drawn by swans, and is named Tristan. A neighbouring baron, who is a rejected suitor for Hermine, determines to carry her off, lays an

ambush, and succeeds, notwithstanding much prowess on the part of Tristan. Being unable to detach Hermine from his arms, the ravishers carry them together to their boat and embark. On the way Tristan throws himself with Hermine into the lake which they are crossing, and, baffling their captors by some unexplained miracle of swimming, succeeds in carrying her to an islet. Meanwhile, thinking herself about to perish, she avows her love for him. Finally she falls asleep, and her lover, supporting her, falls into a very natural train of thought, wherein he thus expresses himself—

“ Combien de fois durant ces heures enchantées  
Aux tremblantes lueurs par la flamme jetées,  
Portant un œil ravi sur ses chastes appas,  
Un invincible attrait me fit ouvrir les bras,  
Et, prêts à la presser sur ce sein qui l'adore,  
Les laissa retomber pour les rouvrir encore !  
Combien de fois, brûlant d'ineffables desirs,  
Respirant de plus près le feu de ses soupirs,  
Dans ses traits endormis mes regards s'étanchèrent,  
De son front virginal mes lèvres s'approchèrent,  
Et sans pouvoir jamais fuir ni s'en détacher  
Mes lèvres ni mes yeux n'osèrent la toucher !

Oh ! que si j'avais pu, dans l'ardeur qui m'enflamme  
Sans offenser, Seigneur, ni le ciel ni ma dame,  
Abandonnant mon cœur à ses divins transports,  
Dans ces bras, sur ce cœur, la presser sans remords,  
Et, lui communiquant le feu qui me dévore,  
Épuiser mon bonheur au moins jusqu'à l'aurore,  
Oui, j'aurais consenti, pour cette nuit d'amour,  
A ne revoir jamais la lumière du jour,  
Mais plutôt qu'à mes bras elle ne fût ravie,  
D'exhaler à la fois mon délire et ma vie ! ”

It must be allowed that, even if this extract contains nothing strikingly new, it is at any rate (with the exception of the terribly weak line which we have italicised as breaking the sense and spoiling the climax) faultless poetry. It forms the real conclusion of the fragment, the few lines which follow merely telling that the hero with the aid of Hermine's beads subdued his inclinations and goes peaceably to sleep. Most of the poems which follow are short complimentary stanzas, or inscriptions in albums ; but at the end of the volume there is a piece of great interest, being nothing less than a version of the famous “ Lac,” containing several verbal variations from the published form, and two entire stanzas which have not hitherto appeared. In the original they immediately succeed the song, and run as follows :—

“ Elle se tut : nos cœurs, nos yeux se rencontrèrent ;  
Des mots entrecoupés se perdaient dans les airs ;  
Et dans un long transport nos âmes s'envolèrent  
Dans un autre univers.  
Nous ne pûmes parler : nos âmes affaiblies  
Succombaient sous le poids de leur félicité,  
Nos cœurs battaient ensemble, et nos bouches unies  
Disaient : Éternité ! ”

It is very possible that Lamartine, in omitting these two fine stanzas, was actuated, as M. de Laprade tells us, by “ un scrupule de discrétion et de spiritualisme délicat,” but it is hardly questionable that the omission has by no means improved the poem. We have always been conscious, in reading it, of an abruptness of transition between the song and the next stanza, of a gap which ought to have been filled up, and this abruptness is now fully accounted for. It is certainly surprising that the poet, if prevented from publishing the poem as it originally stood by a feeling of prudishness, did not endeavour to bridge the interval in some way. As it now appears the piece is, as nearly as can be, perfect.

Nevertheless, in the kind and nature of this very perfection it is not hard to discern the secret of Lamartine's failure where he fails, and of the astonishing diminution which his popularity has undergone. All Frenchmen of literary tastes confess, some with regret, some with indifference, that Lamartine, enjoying as he does the doubtful

honours of a classic, is not read. To M. de Laprade this seems horrible, but the reason is not far to seek. He was read because he expressed the sentiments of his contemporaries, because he clothed those sentiments in more melodious language than the common run of men, even of authors, could attain to. But the sentiments which he expressed have no longer the charm of novelty ; they have been succeeded, if not by others, at any rate by different forms of the same, and the expression not the sentiment is the only charm which remains. Now the formal beauty of Lamartine is not sufficient to arrest the attention of a reader to whom his matter is commonplace or unattractive. It is this fact which is overlooked by those critics who, like the writer of the preface to this volume, object to “ cette importance exclusive donnée à la forme aux dépens de la pensée.” Beauty of thought depends, in an immense majority of cases, on sympathy between writer and reader, sympathy which is produced and destroyed by infinite accidents of place and time. Beauty of form is quite independent of any such casual influences : and it is this beauty which Lamartine has not, at least in any supreme degree. He “ attains not to the first three ; ” he is satisfied with ordinary and accepted vehicles for his thought. To prove this we have only to look at his versification and diction.

The result of the unceasing efforts to smooth and refine the Alexandrine couplet had been but too-often weakness and monotony. Even in Racine's time a sort of horror of any sharp and distinctly sounding word prevailed : and the main object of the French versifier was to produce a line which should run in a kind of easy slope from beginning to end, never arresting the voice by any strong collocation of letters. Gradually, as was natural in the adaptation of a strict quantity-metre to a language which makes no great distinction between long and short syllables, the whole character of the iambic trimeter became altered, so much so that an Englishman often feels inclined to scan Racine's verses as anapaestic dimeters, little or no emphasis being observable except on the third, sixth, ninth, and last syllables. Especially there is a tendency to make the tenth syllable as unemphatic as possible, a pronoun, a preposition, or some other insignificant word occupying that position. Add to this the more or less complete isolation of the couplets, and a tolerably clear idea of the difficulties against which the revivers of poetry in France have had to struggle may easily be obtained. The great poets of the present century have adopted different measures of reform. The excessive purism of French poetical art has barred them from employing the natural and best corrective of monotony—a corrective which Mr. Swinburne has applied with admirable skill and success to the English heroic couplet in “ Anactoria ”—namely, the frequent admixture of tribrachs. But they have perceived and adopted the next best plan, that of relieving the line at intervals with emphatic syllables, especially in the tenth place. Victor Hugo prefers the obvious and not unsuccessful expedient of disjoining it as much as possible by means of stops—an example which has been much followed. Alfred de Musset usually avoids the regular couplet altogether, and by interlacing his rhymes produces irregular stanzas of varying length, which are decidedly effective. Théophile Gautier alone, the “ impeccable ” poet, has managed, by some hidden exercise of art, to reproduce the old Alexandrine couplet, little altered in general aspect, and yet free or nearly free from insignificance and monotony. But Lamartine seems to have thought no change necessary. His verses, melodious as they are, have the old monotonous swing, his couplets the old uniformity of cadence. Even his lyrics have the aspect of Alexandrines cut into shorter lengths rather than of independent creations.

And yet conscious as we may be of these and other shortcomings, it is impossible to urge them without reluctance against the author of such poems as the "Lac" and the "Paysage dans le golfe de Gênes"—poems beautiful in themselves, and wonderful if we consider the literature which preceded them. Lamartine at least began the revival of poetical thought in France, and it seems hard to reproach him who did so much with not doing more. If he was too ready to put the new wine into old bottles, if he lacked the energy, the patience, or the genius to continue the work which he had begun, this is surely not an inexcusable fault, and, but for the extravagant pretensions of his injudicious admirers, would meet with no severe treatment. Lamartine was in some sort a French Cowper. Like Cowper, he clung somewhat to the old forms while setting an example of the new spirit. But the English poet had the good fortune to pass away before any one appeared to continue and excel his work—it was Lamartine's evil destiny to live and *not* to learn.

GEORGE SAINTSBURY.

*Lars.* By Bayard Taylor. Strahan and Co. 1873.

THERE is a curious resemblance in more respects than one between the kind of poetry that finds favour in America now and that which found favour at Rome under Augustus. There is the same combination of refinement in form with a sterile elevation of thought, which in both cases it would be safe to trace to the natural enthusiasm of the few cultivated minds of a vigorous but backward population for the best commonplaces that have been recently imported. The population of America is at once more vigorous, more virtuous, and upon the whole less ignorant than that of Rome in the days of Horace, but as it is incomparably more numerous its other superiorities only make its influence on those who address it more overpowering and more mischievous.

However Mr. Taylor's last volume is a very fine and solid piece of work, and we do not know that it is an unmixed evil that he has found it natural to accept conditions of work which are not exactly favourable to complete originality. It is a real distinction to be able to make as profitable use of *Enoch Arden* and Theocritus as Statius made of Homer and the *Aeneid*.

Lars is a Norwegian hunter and woodman, in love, like Per a fisherman, with a certain Brita who cannot make up her mind between them, and gives Lars enough encouragement to make Per, whom she prefers without knowing it, furious. The result is a fair fight with knives, in which Lars kills Per, and Brita declares her passion for the dead. Lars goes to America to avoid Brita rather than the blood-feud: after an unsuccessful attempt to make himself at home in a Swedish settlement which failed to maintain itself in the neighbourhood of Wilmington, he finally drifts into a Quaker family and falls in love with the daughter Ruth, and is converted in consequence of knocking her father down by accident in the course of a quarrel with her Quaker suitor. After this he naturally feels it his duty to return to Norway to make his countrymen acquainted with the blessings of Quakerism, and gives Thorsten, Per's next of kin, every facility for settling the blood-feud in his own sense at a second knife-fight, where Thorsten of course discovers that it takes two to make a quarrel. Brita finds it difficult to forgive the loss of her lover, but Ruth wins her too, aided by the sudden reappearance of the brooch of Brita's grandmother which had fallen overboard during a voyage with Per; and a Quaker community is prosperously established in Arendal, for the pastor of Hardanger, Lars'

native place, is intolerant of innovations, and is supported by the public opinion of the unconverted majority.

This story is told with a dignified refinement which is too abstract not to be a little unreal; it is impossible to discover for instance how far Lars was exposed to danger from the police: the poetry of real life has its advantages, but it is impossible to have it without its disadvantages of occasional silliness and occasional ugliness which Wordsworth and even Mr. Buchanan have known how to accept. Another drawback that perhaps is akin to the abstract stateliness of treatment is that we cannot help feeling that the skeleton of the story, with its moral which might do honour to a copy-book, stood complete before the author's mind from first to last, instead of growing up in the telling like Marmion or even Evangeline. At the same time it would be unjust to imply that Mr. Taylor has done nothing but overlay his theme with mechanical ornaments; we may not find his theme so interesting as he does, but we cannot fail to see that he has caressed it till it grew into genuine poetry.

The concluding lines of the poem are a fine illustration of what we mean.

"The Lord fulfilled in Ruth one secret prayer,  
And gave her children; and the witness borne  
By Lars, the voice of his ensprinkled blood,  
Became a warning on Norwegian hills.  
Here, now, they fade. The purpose of their lives  
Was lifted up, by something over life,  
To power and service. Though the name of Lars  
Be never heard, the healing of the world  
Is in it; nameless saints. *Each separate star  
Seems nothing, but a myriad scattered stars  
Break up the night, and make it beautiful.*"

One can hardly call the thought poor that turns so naturally into a splendid image; but there are passages instinct with the unmoral poetry of travel which make us wish that Mr. Taylor's imagery always stood alone. Here for instance is Lars' return to Norway:—

"Calm autumn skies were o'er them, and the sea  
Swelled in unwrinkled glass: they scarcely knew  
How sped the voyage, until Lindsnees,  
At first a cloud, stood fast, and spread away  
To flanking capes, with gaps of blue between,  
Then rose, and showed, above the precipice,  
The firs of Norway climbing thick and high  
To wilder crests that made the inland gloom.  
In front, the sprinkled skerries pierced the wave;  
Between them, slowly glided in and out  
The tawny sails, while houses low and red  
Hailed their return, or sent them fearless forth."

That is a series of impressions which it was worth while to describe—it could not have been painted.

In general the Norwegian part of the book is better than the American. The prayer of Ruth's father which converts Lars is impossible without being ideal, while Brita's maidenly hesitation is very pretty and idyllic, though over-analysed: the knife-fight is described as if it had been seen, and it must have been worth seeing; but though Mr. Taylor succeeds in writing like an eye-witness, we prefer an eye-witness who describes his impressions to one who records his inferences, though the record may be vivid and the inferences accurate.

G. A. SIMCOX.

#### LITERARY NOTES.

The second edition of Dr. Emile Isambert's *Itinéraire descriptif, historique, et archéologique de l'Orient* deserves to be recommended to English tourists and the public at large; the first part, treating of Greece and European Turkey (lxxxv-1084 pages with 11 maps and 23 plans, Paris, Hachette, 1873), is just out. All the recent archaeological works and explorations have been laid under contribution, and the English reader will

be gratified to find that use has been made of all important English works bearing on the subject, such as Mr. Tozer's *Travels* and those of Misses Mackenzie and Irby. But the chief value of the new guide, and the reason why it will easily supersede similar books, is that it embodies the explorations and discoveries of the French "École d'Athènes." Many members of the school have placed at the disposal of the author private notes on their itineraries, and some have contributed entire chapters; e.g. the chapter on the Isle of Crete is by M. George Perrot, the well-known traveller and archaeologist, the description of Santorin is by M. François Lenormant, &c. Not only does Dr. Isambert's *Itinéraire* give the practical information necessary to render these countries more accessible to tourists; it also sums up in an encyclopædic form the archaeological discoveries made in that classical and noble soil. Special notices convey the general information required by the traveller who knows but little of the country: such are the introductory chapters on Greece, Turkey, and the Danubian principalities, which treat of the geography, history, architecture, manners, language, and political organization of each. M. Barbier de Meynard has contributed the pages on the Turkish language, and M. Ubicini those on the Roumanian. We are surprised to miss similar notices of the Slavonian languages, and more especially of the Servian, for the knowledge of Servian is quite as necessary in Servia, in Montenegro, and in the Servian provinces of Turkey, as that of Roumanian in Roumania, or Greek in Greece, and everyone acquainted with Eastern matters knows that the development and influence of Servia, "the Piedmont of the East," as a politician has called it, are making rapid progress. It would surely have been easy to put this branch of the subject, as has been done for the others, in the hands of a competent scholar. The importance of the Slavonian element in the Turkish Empire has, indeed, been strangely underrated in this book, and it surprises us to see that for the statistics of nationalities in Turkey the author gives (p. 468) the official numbers, which are manipulated by the Government to make European politicians think that Osmanlis, i.e. real Turks, are twice as numerous as they actually are on this side of the Bosphorus. Notwithstanding its deficiencies in this respect, Dr. Isambert's Guide-book will prove useful to the tourist in the East. Besides, the author, who is a qualified medical man, gives advice on the disorders to which the Western traveller in the East is liable, together with particulars as to diet and medicine by which they may be avoided or cured.

The *Lettres à la Princesse*, which were published a few months ago as the first instalment of Sainte-Beuve's correspondence, have already reached a third edition; a fact which must be held to justify their separate publication, though if all the courteous little notes of invitation, acceptance, excuse, &c., had been omitted there would scarcely have been material for a volume left. The letters certainly help to make us better acquainted with one of whom it might be said (to borrow his own words on Cicero): "C'est le plus grand littérateur qu'il y ait jamais eu, le plus élégant, le plus instruit, le plus spirituel, le plus honnête (avec son grain inévitable de vanité), et aussi le plus philosophe." His philosophy was certainly very like that of a humane gentleman of Imperial Rome, and his vanity, if a susceptibility which was not without dignity is to bear that name, had at least this to excuse it, that passive self-respect is almost as difficult as independent action in an atmosphere so charged with patronage as that in which he had to move. It is strange that with all his acuteness and a sincere if not very enthusiastic patriotism, he should have had no political ideal except that the Emperor should be very intelligent and industrious in saving France the trouble of governing herself. The constant references in the letters to the *Lundi* that happened to be in preparation show how much serious work the author was in the habit of giving to those seemingly facile studies; their accuracy and exhaustiveness had already proved that this must be the case; but a criticism (p. 240) on Renan's imaginative way of reconstructing the past partly explains the satisfaction which Sainte-Beuve felt in showing a character with all the true historical circumstances; his pictures are so complete that it is only on reflection we feel how purely objective his treatment is; the study of history, as he says "les faits authentiques tout nus" has the same attraction as that of science for highly cultivated

men who are tired of their own generation. The most interesting letters, biographically, are those in which this weariness finds expression, though always subdued and controlled by the literary point of honour; there is something heroic in the postscript to a letter dictated from a sick-bed: "Je tâcherai de faire une colonne on deux sur Saint Victor: il faut, tant qu'on est là, saluer les talents." The pointed criticisms on individuals, often still living and famous, which are occasionally met with in the letters, ought not to make enemies to the memory of a writer whose criticisms were always of such a high literary quality that to be made the object of one was to be recognised as a possible candidate for immortality.

In the last number (July 16) of the *Politique Positive*, the Parisian organ of Positivism, it is stated that "imperious and unfavourable circumstances" compel its suspension for an indefinite period.

The *Quarterly Review*, in an article on "Modern English Poetry" in the current number, renews its polemic against a certain artistic school on the ground that its members systematically refuse to give expression to the main aspects of contemporary life. The writers of that school would be more admirable if they were without this limitation of aim, but this is not a reason, though the reviewer seems to think it one, why such artists should force their talent. It is no more a reproach to the civilisation of the thirteenth century to say that it was not yet industrial than it is a reproach to the civilisation of the nineteenth to say that it is no longer military; in the same way it is no reproach to the civilisation of modern England (Victor Hugo is the poet of the revolutions of the Latin races) to say that it has ceased to be poetical. The practical life of different periods is continually finding different channels to express itself in, and when the new channel is found the old is more or less deserted; and it is the same with the ideal life. The main current of intellectual energy runs now to science and politics and history and prose-fiction (though this last is likely to become less copious and more wilfully unreal as we become familiar with the certainties of modern life); it is only a kind of backwater of thought and feeling that keeps poets from being stranded altogether. Poets themselves are a "survival," and it is the law of survivals to dwindle and become extinct; while there are any left they might be allowed to feed in peace upon their natural food, the transformed emotions which arise from a vanishing, decaying past. Those whose good fortune it is to live in the present ought to be able either to leave the past behind without regret or to accept without remonstrance as much as they care for of the only pleasure which it is the nature of its representatives to give.

Anton Springer (*Im neuen Reich*, June 27) points out that a short paper bearing the title "Herstellung des Strasburger Minsters" included in Goethe's *Kunst und Alterthum* was not written by him, but at his request by Sulpiz Boisserée, whose initials were omitted by accident.

Mr. Graves' *Songs of Killarney* (Bradbury, Agnew, & Co.) have a fluent gaiety and tenderness which, together with the distinctive flavour given by the mildly unfamiliar dialect (the author's brogue is not strong), makes them really pleasant reading: "The Invention of Wine" is even positively amusing. "Spring Voices," the second part of the volume, are almost, and "Moods and Melodies" quite up to the highest level of album poetry.

The author of *The Battle of Dorking* has published separately the pamphlet in three volumes on the means of making such a catastrophe impossible which appeared in *Blackwood's Magazine* under the title of *A True Reformer*. He may probably be right in thinking that a pamphlet in three volumes will be more read than a pamphlet in a hundred pages; but there is something confusing and misleading in making some rudimentary though valuable notions of army reform the groundwork of a fabulously prosperous career in politics, and in a book where all the other principal characters are portraits scarcely disguised, it is something more than unfortunate that it should have occurred to the author to make his "true re-

former" interesting by describing the growing alienation between man and wife. It is to the credit of an amateur novelist to prove that he can treat this process as intelligently as and less tediously than Mr. Trollope in *He knew he was right*; and it is almost a stroke of genius to prepare us for the catastrophe by the hero's gratuitous doubts of the honesty of a friendly old lawyer, of which he has the grace to be ashamed; but no doubt suspiciousness and censoriousness are natural temptations to a reformer. The routine of the War Office under the present system is described with a good deal of vivacity, and would probably amuse a departmental public even more than outsiders, who will soon come to be tired of the kind of fun which consists in calling a meddlesome Irish clerk O Verduitt. Still this part of the book leaves the reader under a strong and probably not ill founded impression that an ostentatious parade of accounting for every penny spent to Parliament (under thoroughly unintelligible forms, telling e.g. the total expenditure for cloth but not the cost of a great-coat) has led to a system of mechanical centralisation which makes military efficiency impossible. The writer proposes to decentralise, so as to give the district controllers the possibility of being of some use and of acting on their own account, though not without control, while the War Office is to be broken up into departments each of which would be distinctly responsible for its recommendations to the secretary of state for war, while he would be responsible for adopting them or not. It is further proposed to revive the office of commander-in-chief, who is apparently to use the money and men provided by Parliament at his own discretion, subject to the condition of satisfying the secretary of state for war that he is using them well. The scheme for the organization of the army is extremely plausible so far as it can be explained in a novel. The 109 regiments of infantry are to be reduced to 74, each of which furnishes a battalion for foreign service and consists besides of an active and dépôt battalion serving at home, each of which can be brought up from the reserves to 900 strong, together with two militia battalions of the same strength. The dépôt line battalion and the two militia battalions will be completely localised at the regimental head-quarters; the active battalions serving at home will be distributed during peace in nine military divisions; each division is uniform and permanent and complete as to generals, staff, guns, stores, and equipment. The nine divisions are to be combined in war into three armies under generals provisionally appointed in advance, and the reserves who after training receive a retaining fee of a shilling a day, are mainly officered by unpaid volunteers professionally tested and holding provisional commissions in their respective regiments which lapse after seven years in peace and become permanent during war: the militia is officered from the line. Such an army *might* be efficient, which our present army is not; but it seems rather a strong assumption that it would make invasion impossible, after two moderately disastrous campaigns abroad. A great deal too much stress is laid on the abolition of honorary ranks, seniority generals, and the like; it will always be necessary to make the career of officers, who do not govern the country and are hardly ever allowed to fight, tolerable in time of peace.

M. Philàrète Chasles, whose recent death is announced, was born in 1798. His father was a zealous Republican, and under the Restoration the son, who was then apprenticed to a printer, was prosecuted with his employer and imprisoned for a supposed plot. After his release, on Chateaubriand's intercession, he proceeded to England, where for some years he acted as a corrector for the press in the Valpy establishment. In 1827 his first independent appearance in literature was successful in obtaining one of the Academy's prizes, and subsequently he became a constant contributor to the *Journal des Débats*, the *Revue des deux Mondes*, *Revue Britannique*, &c. His numerous works on literary subjects, especially the contemporary literatures of Germany, England, and America, were marked by more patience and intelligence than originality, and it must be confessed that if the work of such writers is useful to their own countrymen in giving a superficial familiarity with the names of writers and the subjects of books that would be otherwise ignored, they rather shake the faith of natives in the substantial merit of work that seems so completely to lose its aroma in transmission. M. Chasles for

instance was a sincere admirer of Keats, and yet we feel that French readers would be excusable if the *Étude* upon him left them very little inclined to learn English for the sake of his poems. Still M. Chasles was one of the most distinguished of a class of *littérateurs* whose existence is probably useful and certainly unavoidable.

The controversy in the *Athenæum*, June 28—July 12, on the genuineness of some of the writings of De Quincey included in the collected edition of his works has had the advantage of calling attention to some which have been excluded from it. The most important of these are *Waldmor*, published by Taylor and Hennessey, which is a recast of a spurious German novel purporting to be a translation from a work of the Author of *Waverley* generally assigned to Hätings, who published several other novels under the pseudonym of Willibald Alexis; and an original romance called *Klosterheim*, which may be best described as a scholarly and ingenious continuation of the school of Mrs. Radcliffe, less effective precisely because it is more respectable and more respectful to the reader, who is not systematically brutalised to the point of gloating over an ingenious complication of extravagances designed to produce emotions at once coarse and unreal. Unreal is exactly the word to apply to the *Logic of Political Economy*: the writer seems to have thought Ricardo's work needed completing by some acute and elaborate scholia on value, and by the suggestion that the improvement of agriculture counteracted the tendency of rent to absorb profits, from which he feared anarchical inferences would be otherwise drawn. As the writer held that price was fixed independently of both wages and profits, it is curious that he should in some degree have anticipated Mr. Thornton's theory that the wages fund is not absolutely fixed or limited.

It may be new to some of our readers that the poems in *Terza Rima* which form the perorations to Mr. Thornton's volumes on political economy and general philosophy appeared as far back as 1857 with a dedication to the late Professor Aytoun. The volume was published by Longmans, and took its title from the peroration to Anti-utilitarianism on "Modern Manicheism." The most noticeable of the other poems is "Lancelot du Lac," where the theory is that Vivian carried off Ganore for her favourite and left Arthur with a mere *idolon*, and "The Two Francescas": the second has the fortitude to keep apart from Paolo.

Mrs. Archer Clive died at the age of 75 on the 20th ultimo, from injuries received from a fire caused by a coal falling among her MSS. She will be remembered as the authoress of *Paul Ferroll*, an extremely powerful though parasitical book, for the acute, intense, and sensitive mind of the writer was certainly set in motion by *Jane Eyre*. The object seems to have been to deepen the power and horror of the original and at the same time to produce something less brutal (we do not mean this word to be offensive) and more logical. Within these limits the book is a distinguished success, but though less improbable it is more unreal; *Jane Eyre*, with all its faults, contains genuine passion.

## Art and Archaeology.

Lionardo da Vinci's *Treatise on Painting*. [*Das Malerbuch des Lionardo da Vinci*. Untersuchung, &c., von Dr. Max Jordan.] Leipzig: Seemann. 1873.

PROFESSOR MAX JORDAN has made a careful and conscientious study of the circumstances under which the book commonly known as Lionardo da Vinci's *Treatise on Painting* came into print; and though his inquiry could not for various reasons be final, he has brought together much important information respecting the sources and context of this extraordinary volume. The earliest issue of the *Trattato* was a French one, published by Dufresne in Paris in 1651; it contained 365 paragraphs selected from copies made at Milan in the first half of the 17th century by order of Cardinal Barberini. All editions subsequent to this were

taken more or less correctly from that of Dufresne, until Stefano della Bella brought out a new version at Florence in 1792. But della Bella was not more fortunate than Dufresne in the source which he consulted, his MS. being that of Pinelli executed at the close of the 16th century and now preserved at the Ambrosiana. In 1817 Manzi published the Roman edition in 912 paragraphs from a MS. in the Vatican library, which no doubt is of respectable antiquity, but still not in the hand nor of the time of da Vinci.

With incredible patience and minuteness Jordan has sifted and put in order all that can be ascertained respecting these manuscripts; showing what value they possess intrinsically, and what differences characterise the readings. He further proves that after all the *Trattato* as it appears in print, instead of being, as might be supposed, a faithful reproduction of a treatise written by da Vinci, is but a compilation in forms more or less irregular of matter derived from sources none of which are altogether primitive or original. To the question, where the stitchbooks of da Vinci are, and in what shape they were put together; to the further question, whether they were ever written by the master himself, or only taken down at lectures by disciples, no satisfactory answer can be given. We have indeed the assurance of Pacioli in the *Divina Proportione* of 1498 that Lionardo had already finished at that time the "de pictura" and the "movimenti humani," but da Vinci's draught of these sections of the *Trattato* is not known at present to exist; and we are reduced to conjecture as to whether the substance or the letter of them may or may not be found in the twelve codices at present in Paris, no one as yet having given an exact account of those volumes by reason of the difficulties thrown in the way of all students desirous of obtaining a sight of them. Some passages in the *Trattato* are to be found in the *Codex Atlanticus* at the Ambrosiana, of which Jordan gives a complete and exhaustive account; but this codex is made up mostly of fragments and stray leaves, and in so far only leads to an assumption which may prove erroneous, that da Vinci never wrote the *Trattato* at all, but that the book, as handed down to us, is a series of excerpts from notes of lectures and entries in journals collected by the disciples and friends of the painter, and for that reason perhaps not considered till long after his death worthy of the name of so great a master.

Jordan hopes that an accurate examination will be made of the French codices; he trusts that some one may be found to calendar them; but, loth as we may be to think of these hopes being dashed, it is but too likely that the jealousy which has hitherto kept Lionardo's MS. concealed from the public eye will not, in our time, be removed.

J. A. CROWE.

#### NOTES ON ART.

Our slight knowledge of the early Umbrian school of painting at Foligno, of which hitherto Niccolò Alunno has been almost the only known master, has been recently enlarged by the publication of two monographs on the subject, one by Prof. Adamo Rossi\* giving the result of his researches into the registries and archives, especially into the *Archivio comunale e notarile*, of Foligno, and the other by S. Frenfanelli Cibo,† in which, making use of Prof. Rossi's discoveries, he relates the history of Foligno and of several of its distinguished families as connected with its art and its greatest master, Niccolò Alunno, of whose life we for the first time gain a few details. Other masters of the school of Foligno have also been brought to light, such as Maestro Giovanni, who with his sons Girolamo and Bartolommeo is mentioned in documents of the year 1450;

Maestro Andrea di Cagno, who in 1446 painted a picture of the Healers of the Plague at the Town Gates; Maestro Bartolommeo di Tommaso, several of whose works are still preserved; Maestro Giambattista di Domenico di Riso, who in 1463 painted a beautiful Madonna and Child in Perugia, in which town he had settled and was held in much consideration; Maestro Pietro di Giovanni Mazzaforte, whose name occurs several times in the archives of Foligno; Maestro Polidoro di Bartolommeo; Maestro Christoforo di Jacobo, Ugolino di Gisberto, painting in 1479; Maestro Feliciano de' Muti in 1501; Maestro Francesco, mentioned in 1513; Maestro Lattanzio, Niccolò's son; and Maestro Bernardino di Pierantonio Mezzastri, who brings the list down to the middle of the sixteenth century. The names of all these Foligno masters have been rescued from oblivion by the researches of Prof. Rossi; but as with other researches of like kind that have been of late diligently carried on in Flanders and elsewhere, we gain little besides the bare knowledge that such masters existed, for almost all their works have perished. Even such slight knowledge as this is however valuable, as showing the marvellous artistic activity put forth in the fifteenth and sixteenth centuries by other schools than those with which Vasari has made us acquainted.

The Salon is now closed, and the critics have nearly finished their articles upon it. The total number of entries during the past exhibition is recorded as 435,055, of which 154,796 were by payment and 280,259 gratuitous. 43,344 catalogues were sold.

\*The official catalogue of the Vienna Exhibition enumerates 1,537 pictures, sculptures, and other objects of art sent from France, 811 from Austria, 725 from Germany, 625 from Italy, 296 from Belgium, 203 from England, 198 from Switzerland, 167 from Holland, 155 from Hungary, 437 from Russia, 101 from Denmark, 71 from Norway, 45 from Sweden, 37 from Greece, 15 from America, 7 from Turkey, and 2 from China. It is not surprising, considering the large proportion of works that France contributed, to find that French artists have received the largest number of medals, namely 138 for paintings, 34 for sculpture, 26 for architecture, and 49 for engravings.

The Spanish school of painting, of which we have so few examples in England, has been represented in several sales that have recently taken place in London. At the newly established Crockford's Auction Hall, the English "Hôtel Drouot," there was sold last week a small but important collection of pictures belonging, it was stated, to a foreign nobleman. Among many examples of the Italian, Flemish, Dutch, and French schools there were also a few Spanish works of remarkable excellence and not of that ascetic religious character which usually marks the productions of Spanish art. A portrait of Philip IV. by Velasquez, an authentic picture of which the catalogue gives a detailed history, was perhaps the most important of these works; but more interesting because less often met with in this country were a portrait of a Chorister of the Chapel Royal by the violent and eccentric Alonso Cano, a portrait of Philip III. by the prudish Carducho, another of a Spanish Doctor by Zurbaran, and two small full-length figures of Spanish Troopers in Flanders by Bocanegra, a pupil of Vandyck and skilful copyist of his style.

A painting by Murillo, also, the one Spanish master with whom we are well acquainted in England, was sold a short time since by Messrs. Phillips & Son, of New Bond-street. The subject of this painting is St. Anthony of Padua adoring the Infant Saviour, and it is said to have been painted by Murillo about the year 1650 for the Church of the Capuchins at Cadiz in return for the kindness shown by the monks of that order to his brother. About fifty years ago this picture was exhibited at the Egyptian Hall, Piccadilly, and excited considerable attention. Since then it has remained in London, but has not been heard of until a few weeks ago, when in consequence of "the settlement of certain family affairs" it came into the hands of the auctioneer, and after a lively competition was acquired by Mr. Cox, of Pall Mall, for the sum of 1,200 guineas.

Mr. Storey's statue of "Jerusalem," which he refused to the Academy, is now being exhibited at Messrs. Holloway's. It is, it need not be said, an extremely remarkable work, admirable perhaps even more for its literary than for its artistic power.

\* *I pittori di Foligno nel secolo d'oro delle arti Italiane, testimonianze autentiche raccolte ed ordinate.* Perugia, 1872.

† *Niccolò Alunno e la scuola Umbra.* Roma, 1872.

The statue of Carrara stands on a pedestal of polished grey marble; the flesh is tinted to an uniform cream colour to anticipate the effects of time. The figure is seated with one leg crossed over the other among ruins on which the right arm leans, while the left hangs quite listlessly. She wears a sleeveless tunic very nobly treated, a short veil that covers almost all the hair except just at the ears, and a phylactery, which is just as well, for the features are less Jewish than those of the Libyan sybil were African. The face is raised a little and turned to the front of the pedestal, while the body and limbs turn off to the left or the spectator's right. The left side seen in profile gives an expression of generous sadness almost without anger, not quite without hope; but this is probably an accident which might just as well have occurred in nature, for in front where the scowl of the brow is visible we see dumb rage and indignation dying down into unutterable despondency. There can be no doubt that this stony grief is the expression intended, and it is rendered with superb energy, though a doubt suggests itself whether an even more consummate artist than Mr. Storey might not have helped us more to feel that the cheeks and eyelids *had been* flesh before grief stiffened them.

On the plinth of the statue are carved some verses of Lamentations in the Vulgate beginning *Quomodo sedet sola civitas.*

The French Minister of the Fine Arts has bought, it is said the following pieces of sculpture recently exhibited in the Salon:—*L'Enfant des Abruzzes*, bronze de M. Allar, 4,000 fr.; *Jeune Femme au Bain*, de Mme. Leon Bertaux, statue plâtre, 3,500 fr.; *L'Enfant à la conquête*, plâtre de M. Chervet, 3,000 fr.; *L'Éducation Maternelle*, de M. Eugène Delaplanche, 4,500 fr.; *Le Mercure*, plâtre de M. Ludovic Durand, 3,500 fr.; *le Buste de Mgr. Darboy*, plâtre par M. Guillaume, 1,500 fr.; *Le Jeune Faune*, plâtre de M. Jules Blanchard, 3,500 fr.; *Mélantho Groupe*, plâtre de M. Allouard, 4,000 fr.; *Jeune Pâtre jouant du tibia curva*, de M. Laoust, 3,600 fr.; *l'Alcéis* de M. Hyacinthe Sobre, 1,000 fr.

A sympathetic article by Ludwig Bund in memory of the late Hugo Becker appears in the current number of the *Zeitschrift für bildende Kunst*, which likewise contains a large but unsatisfactory etching by the young artist, the promise of whose work was doomed to be unfulfilled by reason of an early death.

Mrs. Combe has presented Holman Hunt's famous picture, "The Light of the World," to Keble College, Oxford.

### Theology.

Holtzmann on the Epistles to the Ephesians and Colossians. [*Kritik der Epheser- und Kolosserbriefe auf Grund einer Analyse ihres Verwandtschaftsverhältnisses*.] Dr. H. J. Holtzmann. Leipzig: Engelmann. 1872.

THIS volume marks a significant epoch in the criticism of the epistles with which it deals. Those writers who deny the Pauline authorship of one or both of these letters have been unable to agree among themselves which is the original and which the copy. To the maintainers of their genuineness this question of priority is unimportant; for, supposing that they proceeded from the same author and were written about the same time, we have a sufficient account of the phenomena which create this difficulty. When ideas are still in a fluid state in the mind of the author, they are easily moulded in different shapes, being modified in form and expression as they are influenced by the connexion in which they stand. On the other hand, when they are once crystallized in a written document, they cease to be so tractable. They may be borrowed wholly or in part, and may be broken up or re-arranged in the process; but there ought to be no difficulty whatever in distinguishing the original author from the later plagiarist when the works are set side by side.

Dr. Holtzmann's book is valuable as a confession that any simple theory which postulates the absolute priority of either one is untenable on the hypothesis of spurious authorship. If we place the parallel passages of the two epistles side by side we seem to see in different passages, and indeed in different expressions of the same passage, that the presumption of originality is now in favour of the one epistle and now of the other. De Wette and Mayerhoff both arrange their extracts in parallel columns, as the champions of opposite sides. The advocacy of each is damaged as much as it is served by the passages which he adduces. Criticism has been brought to a dead lock.

Dr. Holtzmann has come to the rescue by a theory of his own, which we may briefly describe as the hypothesis of *reciprocal obligation*. He supposes that the original nucleus was a short epistle to the Colossians, the genuine production of St. Paul, which he finds embedded in our canonical epistle. On this basis an unknown writer forged in St. Paul's name the so-called Epistle to the Ephesians; and, having done so, turned back to the genuine Colossian letter and interpolated it freely, making use of his previous forgery for this purpose. I have called this theory Dr. Holtzmann's own because, though a similar hypothesis was suggested by Hitzig, yet it certainly would not in its original form have attracted much attention; and Dr. Holtzmann has fairly established his claim to ownership by the most careful and systematic elaboration.

Without stopping to inquire whether such a theory bears

on its face the recommendation of probability, we may fairly ask whether the facts alleged by Dr. Holtzmann are sufficient to justify us in setting aside the absolutely universal belief of antiquity respecting the authorship of these epistles. I turn for instance to his remarks on the peculiarities of diction as an indication of spuriousness. I find him calling attention to the words occurring in the Epistle to the Colossians alone among the New Testament writings. "Not only," he writes, "is their great number astonishing—there are thirty-three of them—but also their partially un-Pauline look" (p. 105). Wishing to test the value of such statistics, I told off a number of pages from the end of 2 Corinthians exactly equal in length to this epistle, and I found that they contain at least forty such peculiarities of diction. In the Epistle to the Ephesians, which is half as long again, Holtzmann only reckons thirty-seven (p. 101 sq.). What he means by their un-Pauline look may be inferred by his remarking that St. Paul uses *κατάρτισις* (2 Cor. xiii. 9) and not *κατῳρτισμός* (Eph. iv. 12); that he writes *ἀναπληρῶν* (1 Cor. xvi. 17, Phil. ii. 30) and *προσαναπληρῶν* (2 Cor. ix. 12, xi. 9), but not *ἀνταναπληρῶν* (Col. i. 29). But starting from the genuineness of Ephesians and Colossians (and the external evidence for either is decidedly stronger than for 2 Corinthians), I might argue conversely and similarly that this portion of 2 Corinthians cannot be genuine, because St. Paul uses *κατῳρτισμός* and not *κατάρτισις*; because he writes *ἀναπληρῶν* and sometimes *ἀνταναπληρῶν*, but never *προσαναπληρῶν*. When again Dr. Holtzmann lays stress on the fact that the number of *ἅπαξ λεγόμενα* in these epistles is "great in proportion" (*verhältnissmässig*, pp. 101, 106), it is difficult to grapple with this vague charge; but surely the heresy in the Epistle to the Colossians was quite as exceptional, and therefore as likely to call forth peculiarities of expression, as any circumstances in the passage which I have taken for comparison, or again in the description of the heathen world, Rom. i. 18-32, where the number is quite as great or greater in proportion to the length. Again he thinks it worth while remarking that the Colossian letter contains fifteen words which, though occurring elsewhere in the New Testament, are not found elsewhere in St. Paul. Excluding for the sake of argument the Pastoral Epistles, as Holtzmann does, I counted at least thirty such words in the passage from 2 Corinthians, and probably there are many more, for my investigation was not complete. Why Dr. Holtzmann should lay less stress on this class of words than on the former it is difficult to see; for when St. Paul's style is in question they must be quite as valuable. Of these words however he singles out *πλουσίως* (Col. iii. 16) as worthy of special notice (p. 107). It may be matched with *ἐτοίμως* (2 Cor. xii. 14), which is an exact parallel. Once more; he remarks of the Epistle to the Colossians, "Altogether astonishing is the absence of compounds with *ὑπέρ*, which are so abundant in Paul." He has forgotten that the whole Epistle to the Galatians, which is considerably longer, contains only one instance, the common word *ὑπερβολή* (i. 13), while in the Epistle to the Ephesians, written (according to Dr. Holtzmann) by the interpolator of the Colossian letter, we meet with not less than six. Can we then say that this partiality for compounds in *ὑπέρ* is more characteristic of the genuine Paul than of the unknown forger?

These instances will show the general character of Dr. Holtzmann's researches into the language; but his whole method of dealing with this portion of the subject suggests one general remark. St. Paul's missionary life comprised at least a quarter of a century on any showing; and his epistolary activity must have extended over a considerable portion of this time. Of his extant epistles the first four of our canon

were written within about a year; and Dr. Holtzmann practically limits us to these as the standard of the apostle's style; for he only allows the genuineness of two or three short epistles besides, which together amount to less than one-fifth of the whole body. On what grounds then of reason or analogy are we required to take the literary productions of this short period, as setting the limits to the vocabulary of a man whose life was spent among constantly shifting scenes and circumstances, and whose mind was ever open to fresh impressions?

If from the investigation of the internal character we turn to the treatment of the external evidence, we find it equally unsatisfactory. Dr. Holtzmann would place the date of the Epistle to the Ephesians about the end of the first or beginning of the second century (p. 276). At the same time he allows that it is certainly employed in the First Epistle of St. Peter, while he speaks more doubtfully about its use in the Epistle of the Roman Clement. He has not remembered that the First Epistle of St. Peter itself is certainly quoted in Clement's Epistle—a most important fact in its bearing on the date of the Ephesian letter, as will be evident at once. He has indeed left himself a loop-hole for escape from the inference thus suggested by throwing doubt on the date of Clement's Epistle (p. 277); but will it not occur to the thoughtful reader that a theory which obliges its champion to deny the authenticity of so many documents—the Third Gospel (p. 255), the First Epistle of St. Peter, and the Epistle of Clement, besides several other early Christian writings (p. 276 sq.)—thus discarding a large mass of cumulative testimony, is burdened with a load of improbabilities, compared with which the difficulties of expression and thought in the letters to the Colossians and Ephesians, regarded as the genuine productions of St. Paul, are only as a handful of feathers in the scale? Of this mode of dealing with evidence M. Renan has good reason to say, speaking of Dr. Holtzmann's work, "*Que de dangers dans cette méthode trop accréditée en Allemagne, où l'on part d'un type à priori qui doit servir de critérium absolu pour l'authenticité des œuvres d'un écrivain!*"

But there remains one branch of circumstantial evidence, which Dr. Holtzmann has only glanced at, and certainly has not grappled with. The omission of the words *ἐν Ἐφέσῳ* in Ephesians i. 1 from the oldest extant MSS. and from copies used by Origen and Basil; the fact that Marcion called this letter an Epistle to the Laodiceans; the reference in the Colossian letter to an epistle which the Colossians were to obtain from Laodicea; the absence of all special allusions to the Church of Ephesus in the Ephesian letter, connected with the commission to Tychicus to give oral explanations; the circumstance that numerous parallels connect the two epistles together and suggest contemporaneity of writing;—all these are so many convergent lines of evidence, which have their meeting point only in the genuineness of the two letters, the Epistle to the Ephesians having been a circular letter to the Asiatic Churches. Dr. Holtzmann allows that his forged epistle was published in the form of a circular letter; but he supposes (a very improbable supposition) that Marcion adopted his title on purely critical grounds; and he ignores the connexion of the other points of evidence. Yet, when in a Chinese puzzle we find that several distinct blocks of different sizes and shapes fit together and form a symmetrical whole, we are forced to the conclusion that this result is not purely accidental; and in history the cogency of circumstantial evidence is the same. The simple postulate which connects and explains a large number of various facts has the strongest claims upon our belief. This apparent inability to weigh historical evidence constitutes one of the most serious defects in Dr. Holtzmann's elaborate work;

but so much conscientious and unsparing labour will not have been thrown away, if it results in showing that the hypothesis of spuriousness, even in the hands of its most diligent and careful expositors, is attended with critical difficulties far greater than those which it is framed to remove.

J. B. LIGHTFOOT.

### RECENT WORKS IN POPULAR THEOLOGY.

*Letters to the Scattered, and other Papers.* By Thomas T. Lynch. Strahan and Co.

*Theology and Morality: Essays on Questions of Belief and Practice.* By the Rev. J. Llewelyn Davies, M.A. Henry S. King and Co.

*The Mystery of Matter, and other Essays.* By J. Allanson Picton. Macmillan and Co.

*The Reconciliation of Religion and Science: being Essays on Immortality, Inspiration, Miracles, and the Being of Christ.* By the Rev. T. W. Fowle, M.A. Henry S. King and Co.

THE students of a science are naturally loth to confess that their science is not progressive; but, if in fact it be not, it is plain that nothing but harm can come from ignoring the fact. Whether the study of a non-progressive science can be interesting or remunerative is another question: thus much only is plain, that if it is to be studied it must be studied in the works of the best of former students, not of the most recent. In a progressive science the dwarf has a longer view than the giant on whose shoulders he sits: but where this external aid fails us, it is scarcely possible for us to add so many cubits to our own stature as to enable us to see further than the giants who were on the earth in the days of old; and it is at any rate evident that we gain nothing by borrowing the eyes of our nearest neighbours, when they scarcely can see over our own heads.

Now in the theology of the present day, evident as it is that the fashions are rapidly changing, it is anything but evident that knowledge is advancing, and the four books mentioned above have this in common—that they do not seem to recognise the distinction between those very different ways in which popular beliefs may be modified. The two first mentioned writers, indeed, are open to the charge in a much less serious degree than the other two. Mr. Ll. Davies' book consists of a series of articles which have (with one exception) appeared in periodicals of different sorts: and, judged as magazine articles on questions of the day, they are readable, amiable, and intelligent. Whether a man of Mr. Davies' ability could not give us something better than magazine articles—whether he could not rise to treat questions of more permanent interest by frittering away less of his knowledge and thought on such as are questions of the day only—this is a matter for himself to decide: if he has given us the best of his mind in this fragmentary and occasional form, we have no right to complain of the want of unity and breadth of view. Only there is a certain danger that if our magazine writers are too good we shall not only lose the best instruction of writers who have a capacity for something better than magazines, but the tendency will be encouraged, which already exists among readers, even such as may fairly be called students, to take their facts from magazines instead of books, and their opinions from what they find habitually assumed as self-evident, instead of from the first-hand influence of the pregnant suggestions of far-sighted thinkers.

*Letters to the Scattered* are also reprints, and post-humous ones. They appeared chiefly we are told in the *Christian Spectator*, at various dates from about 1853 to 1860. It can hardly be judged other than a mistake to reprint *in extenso*, as is here done, the fragmentary contri-

butions to dissenting magazines of a man above the ordinary level of their contributors, but still exposed to the temptation to descend to that level for the sake of his habitual readers. Some of the papers here reprinted are simply sermons and good ones—worth reading, as the author's sermons were certainly worth hearing: but more of them are simply tracts, and while some have a literary merit above that of most tracts—that on "William Treville" has a tender meditative pathos that faintly reminds one of Elia—others are questionable in taste, and one-sided—sometimes even a little unjust—in argument. The *Letters to the Scattered*—i.e. to the minority who, whether "professed Christians" or no, have their intellects active and their interest alive on religious questions—are far above the ordinary tract standard of power. But the first of them is addressed "To Mr. Christian Adamson, of Busy Street, City, and of Quiet House;" and soon we come to a discussion with "Inquirer," with no article and a capital I, as though it were a proper name: all which "corrupt following" of John Bunyan rather offends a reader, unless he remembers that to those for whom it was meant the *Pilgrim's Progress* is the only English classic known more than by name.

The real interest of the book is a representative one: as the orthodox Dissenters have been more or less outside the general course of English intellectual life, so the intellect of England has been apt to ignore them, and it is worth while to have a favourable specimen of what passes for liberal theology among Dissenters. Mr. Lynch's liberalism is of the mildest order, and does not extend beyond sympathy for religious perplexities and earnest warnings that neither speculative orthodoxy nor Congregational Church Government has any value without vital Christianity: yet his tone is always that of a man deprecating imputations on his own orthodoxy, and perhaps we are to understand that suspicions were actually roused against him from the intimation that "circumstances prevented" the series of *Letters to the Scattered* being continued as the author intended. It is only fair to say that if he was assailed on theological grounds the blame must rest entirely with his assailants.

Leaving these two books for the more ambitious works of Mr. Fowle and Mr. Picton, it is difficult to say whether we pass to a higher or lower level. It would be a good thing if the average thought of liberal Churchmen and earnest Dissenters were as good as the thoughts of Mr. Davies and Mr. Lynch: and their works scarcely claim to be more than the utterance of good average thought, such as is current, less articulately, in the schools to which the writers belong. Beyond their own classes or schools it is not to be expected, nor perhaps to be desired, that they should have much influence: within those limits their influence is sure to be salutary. But books like the other two claim to be contributions to theological science, and must be judged by a scientific standard: and when so judged the verdict can hardly be favourable. There has been more ability spent upon *Religion and Science*, perhaps even upon *The Mystery of Matter*, than upon either of the former works; but it has been more unquestionably misapplied. One may sympathise with Mr. Picton's well-intentioned gropings after truth and piety, and be pleasingly surprised by Mr. Fowle's quaint combination of deprecatory reverence with combative liberalism: but scientific treatment is what subjects like theirs call for, and scientific is not the word for the way they have actually treated them. Mr. Fowle glories in his ignorance of "technical orthodoxy" (p. 332) without any suspicion that this ignorance is other than a qualification for superseding it: his quotations even of texts of Scripture are constantly inaccurate, and a man should know the Bible at least as well as he knows educated contemporary opinion

if he is to effect a reconciliation between the two. In his Preface he does himself less than justice: he fights and scolds in behalf of liberal theology, as though he were incapable of any higher object than a party victory for the religious liberals; but, if party considerations are to be imported into such discussions at all, instead of a wondering lament over the fact (if it be a fact) that religious liberalism has made less progress than Tractarianism, in spite of the influence of three such men as Arnold, Robertson, and Maurice, it would have been worth while if he had asked whether we had not here an example of the impossibility of compromise between irreconcilable principles.

The essays composing the volume are of very different value: those on Inspiration and Miracles being inferior to those on Immortality—in spite of the quaint paradoxes in the latter about the demoralising influences of belief in Heaven and Hell. The two best are the first and last in the book; the latter, on "The Church and the Working Classes," is as sensible as any of Mr. Davies', and perhaps more thoughtful, while in the first there is a good deal of moral insight, and that subdued earnestness, which has been rare in English theology since the dissolution of the Tractarian school, in the way he develops a *contrast* between the character represented in the Gospels and the character inculcated by them.

But the main argument of the book—a tenable one enough, it may be, in itself—is never consistently worked out: the author's own idiosyncrasies, and the current intellectual fashions of the day, force him to mutilate his theory at every joint. The argument, briefly stated, is this: the strength and the first principle of science is that it rests upon facts: the Christian religion is founded upon alleged facts, and if these can be verified (as, if real, they can be by scientific tests) then religion and science will be reconciled. *A priori* tests of incredibility are, in matters of fact, out of place: and Mr. Fowle thinks that the Resurrection, at least, is established as a fact by the ordinary tests of historical evidence: further, that it appears by those tests that there were three great ages of miracle in the history of Israel—the ages of Moses, of Elijah, and of Christ. But then, having refused to reject miracles as incredible *en masse*, he brings back upon us the *a priori* test in a new form, only less consistently applied: miraculous stories are rationalised or denied if it seems to Mr. Fowle that "life could not be carried on under such conditions;" and the belief assigned to any scriptural story, miraculous or otherwise, seems proportioned not to the evidence for it, but to its importance to the Christian life, or the theory of it held by the author. Really, if the Book of Genesis is the very infallible Word of God, we have no doubt good reason to believe that there were such persons as Abraham, Isaac, Jacob, and Joseph: but if this assumption be given up—and Mr. Fowle does not seem to maintain it, or to think it can be maintained—it is difficult to see how they are known to be more real persons than Deucalion, Hellen, and his sons. But in this book (as even by Mr. Matthew Arnold) Abraham is spoken of as though we knew as much about his religious feelings and beliefs as about those of David or St. Peter; and it is scarcely unfair to say that what in more orthodox writers would be only consistency is little better than prejudice in those who concede so much.

One passage from this book seems worth quotation as a warning of what a writer comes to who undertakes to modify out of his own head the system that he has inherited from men (to say the least) with real powers of speculative insight and systematic logic, while he ostentatiously neglects the study of their works, their method, and ignores much of their spirit:—

"To believe that Christ was sinless, and yet in His origin purely human, is to believe not in a miracle, but in a monstrous prodigy—it is to believe that God will break His own laws, do violence to the reason which He has implanted in man, and become the author of irremediable confusion."

Mr. Fowle would not like to be called a Calvinist: perhaps he does not know what a Supralapsarian is. But what is it but Supralapsarianism to say that it is a law of God that men shall be sinful? The Christ of Channing and the Madonna of Pius IX. may not be real beings, such as ever lived on earth: but it is quite possible for the human mind to conceive their existence, and it is most extraordinary to say that the divine goodness would have been dishonoured in the creation of either.

Mr. Picton's book is as ambitious in its scope as Mr. Fowle's, and its ambition, likewise, seems mainly due to the confidence of ignorance—ignorance, however, in his case of a more excusable sort. Like the former, this volume is confessedly rather a series of essays on kindred subjects than one work divided into chapters: and the essays are such as it does a young man good to write by way of self-education—to have written such essays as these does any young man great credit. But to publish them—and it appears by the title-page that this is not a first work—can only be accounted for by a want of intellectual perspective. He is repelled by the atomic materialism of recent physical science, and seeks to escape from a system like Mr. Herbert Spencer's founded upon it: he is attracted by the "Christian Pantheism" that he finds suggested to him by Mr. John Hunt, and sees in that the only means of escape from the other. But he seems quite unable to grasp the meaning of such a system as Materialism or Pantheism, or its relation to other theories of the Universe, as something greater than the effect produced on his own mind by a single book. He makes in one place the rather extraordinary assertion, "that the establishment of the ultimate substantiality of atoms, or the proof of any theory which should give to the impenetrability of matter more than a phenomenal and conditional value, would necessarily be fatal to any spiritual idea of the universe, and must logically involve atheism." If the word "ultimate" is to be pressed to mean "uncaused," this is of course a truism, but if not, it is difficult to see how, "if the ultimate atoms are real substance, it follows that they are the *only* substance in the universe" (pp. 65, 73). Yet a little further on, after this indignant rejection of anything that looks like Materialism, the point is conceded which alone makes Materialism worth resisting in the interest of morals or religion—that we have no certainty that our own relation to the Infinite Life differs in kind from that of the (in the popular sense) material world. And the claiming as testimonies to Pantheism all the utterances of mystical devotion is a complete ignoring of the question between Theism and Pantheism: St. Paul, and orthodox Christians after him, say that man "lives and moves and has his being" in God, and would admit, though in a somewhat different sense, that the same might be truly said of the Universe: but we do not approach Pantheism unless we say that God lives and moves and has His being in the world, as well as the world in Him. That God is the only Being with more than a phenomenal, dependent, conditional existence, every Christian will acknowledge: if it pleases anyone to abridge this into saying He is the only "Substance," it may be a merely verbal difference; but the question at issue is, has God a Being independent of all (not merely of any) of the phenomena through which His Being is known to us? The main objection to Pantheism, that it does not account for the possibility of the existence of evil, is not touched till the

very end of the book, and then dismissed, in the usual orthodox way, as a mystery upon any hypothesis.

There can be no doubt that it is the duty of everyone who is able to think to make up his mind on the grandest and most practical of all subjects that can occupy thought. There are two possible views as to the right attitude of mind for the investigation of these questions: some will say that truth is to be received submissively, others that it is to be pursued actively: and these two moral ideals reproduce themselves in two opposite, though often interlacing, schools of theological thought. Neither a teacher nor a learner can be blamed, on intellectual grounds, for attaching himself to one of these schools rather than the other: but the fact that the second and more self-dependent one has at present the advantage in the ability of its professors and popularity of its principles gives no right to those of its adherents who are as yet only learners to undertake to teach. This is what Mr. Picton has undertaken, not from vanity, but from an inadequate view of the magnitude of the problem, and still more from inadequate knowledge of what has already been contributed to one or other of its alternative solutions. Mr. Fowle might be conceded the right to speak, not merely as a student, but as a teacher, so far as his powers and maturity of mind are concerned: nor does his intellectual training appear to have been so narrow or so self-directed as the other author's. But he reminds one of Bacon's criticism on the application of dialectic to natural philosophy—that it is like a man practising gymnastics when about to build a pyramid, instead of constructing machinery.

— WILLIAM HENRY SIMCOX.

#### NOTICES OF NEW BOOKS.

*Conspectus Rei Syrorum Literariæ* additis notis bibliographicis et excerptis anecdotis. Scripsit Gust. Bickell. Monasterii. 1871. pp. 112.

THIS unpretending work, a copy of which has only just reached us, is based, we believe, on a series of articles on Syriac literature, which appeared in the *Literarischer Handweiser*, of Münster, for 1870, and were duly mentioned in the early numbers of the *Academy*. As it is already well known to Orientalists, we cannot do better than commend it to as favourable a reception from theologians. It is really time that students of theology should open their eyes to the rich and peculiar developments of which the only memorials are in Syriac, and this constitutes the principal claim of the little volume before us on their attention. It is mainly bibliographical, but so abundant in details that it may serve to some extent as a history of Syriac theology. The fullest portion is that on the liturgies and rituals, a subject on which few scholars have so good a right to be heard as Dr. Bickell. We notice that it contains the germ of an interesting work by the same author, *Messe und Pascha*, to which we called attention in No. 75. The numerous extracts from Syriac writings, some of them *anecdota*, are given throughout in a Latin translation. It only remains to be added that the author is a zealous Catholic; this is no detriment to his accuracy, though it is perhaps somewhat too ostentatiously displayed.

*Lectures on the Pentateuch and the Moabite Stone.* By the Right Rev. J. W. Colenso, D.D., Bishop of Natal. Longmans.

AN attempt to popularize the evidence for the most important results of advanced Biblical criticism, such as (1) that no part of the original story of the Exodus can have been composed *before* the time of Samuel, (2) that Deuteronomy was written not long before the Babylonish captivity, and (3) that the Levitical legislation originated during the exile (a result, we may remark, which will be questioned by other than "traditional" critics). Three appendices are added: 1. the Elohist narrative from Genesis and Exodus; 2. the original story of the Exodus from the books of Exodus, Numbers, and Deuteronomy; 3. extracts from the *Edinburgh Review* (of which we do not quite see the relevance) respecting the pre-Christian Cross. A work of this kind does not claim to be original, but even scholars will be interested by the remarks on p. 9 accounting for the superiority of the Elohist to the Jehovistic writers; on Giant-stories (pp. 33, 34); on the critical bearings of the Moabite inscription (p. 58); and especially the answer (pp. 87, 88) to Dr. Kuenen's argument (*Onderzoek* iii. 258) against the Davidic authorship of Ps. lxxviii. It must be allowed that the Moabite inscription

supplies an indirect confirmation of Bishop Colenso's view as to the age of the Jehovistic portions of Genesis; but does not the Bishop go too far in rejecting (with Captain Burton in his last work) the account in 2 Kings iii. 4-27 as "a manifest fiction" (p. 361)? A more sober and critical view seems to be taken by Nöldeke in *Die Inschrift des Königs Mesa*, pp. 20-22, comp. *Academy*, vol. iv. p. 116. On the whole, Bishop Colenso has shown great skill in condensing the salient points of his argument, and deserves a careful hearing from the educated laymen whom he addresses.

*Essays Biblical and Ecclesiastical.* By the Rev. Henry Burgess, LL.D. Longmans.

THE republication of these neither brilliant nor profound essays on such well-worn subjects as the study of the Bible and the education of the clergy would not under ordinary circumstances demand a record in these pages. We notice them chiefly on account of the services rendered to theological studies by the venerable author in the last generation. The *Journal of Sacred Literature*, of which Dr. Burgess was for fourteen years the editor, stood absolutely alone in England as the organ of a really learned theology. He is, besides, not unknown to Orientalists by his translations from the Syriac, though these have escaped the attention of Dr. Bickell in his otherwise accurate *Conspectus*. But there is also a peculiar historical interest attaching to his theological position. He is one of the few erudite members of the great Evangelical body, and has shaken himself free from some of the most uncritical prejudices to which his brethren are liable. This will best appear from a sentence or two of the preface, which is perhaps the most interesting portion of the book to those who do not belong to the limited public specially addressed in the essays.

"Although trained in early life in a somewhat advanced Puritan school, the writer was ever led to recognise a distinction between Divine Revelation and the casquet which contains it, and therefore never was fettered by that idea of an organic oneness in the whole collection of the Old and New Testaments which, he is thoroughly convinced, lies at the root of many luxurious growths of exegetical error and polemical fanaticism. For instance, the writer in no period of his mental history would have been disturbed had the Apocalypse been placed before St. Matthew, or the Canticles and Esther been relegated to the region of the Apocrypha." (Preface, p. vii.)

Dr. Burgess is merely a philologist, or what used to pass current under that name. He has no sympathy with speculation, and thinks dislike of truth the source of heresy. A sound theology is, according to him, the reproduction of Biblical ideas in their original purity. Hence his earnest advocacy of Biblical criticism, and his somewhat startling preference of the Rationalists, who at any rate call forth the energies of more devout students, to the "Perfectionists," who "deny the truth of whatever is not found in their pre-arranged and settled system" (p. 196). Hence too his fervent protest against the mischievous vagaries of Millenarians, and the insipid mysticism of allegorical commentators on the Canticles.

#### Intelligence.

We regret that we have not space for a complete analysis of Dr. Salmon's valuable essay on The Chronology of Hippolytus, in No. 1 of the new Dublin serial *Hermathena*. One of the interesting questions he touches is, How came Hippolytus in his Chronicle to set down the episcopate of St. Peter at twenty-five years? "One single assumption," he replies, "will explain not only this, but all the variations between the Catalogues of Hippolytus and Irenæus; it is that Hippolytus received the Pseudo-Clementines as historically trustworthy; in particular, that he received it as a fact that Clement was ordained bishop by Peter (*i.e.* not later than about A.D. 67). . . . When you push back Clement's episcopate so early, you will find after his death a large gap in your chronology, which you will not know how to fill up without completely altering the times assigned for the episcopates of subsequent bishops. Grapple with this problem, and I will not say that the solution of Hippolytus will be forced upon you; but I will say, you will not have devised one more simple and ingenious, and which with less violence fulfils the conditions of the question." He differs from Lipsius in his *Chronologie der röm. Bischöfe* in his view of the date assigned to the death of St. Peter in the Hippolytine list, which is not 55, but 67, also on the question whether in the Roman Church of the first century "one presbyter did not stand out clearly to be distinguished as holding recognised superiority over the others." "If history had handed down to us the names of leading presbyters at Rome during the first century, but had left their order in utter uncertainty, it would be a most natural and legitimate inference that there never had been any order, that all had been originally equal, and that it was only in order to make the history correspond to later notions of Church government that the names were arranged in order, which order different writers settled for themselves in different ways. If the view taken in this paper be correct, precisely the opposite conclusion follows."

The *Edinburgh Review* for July contains a thoroughly competent

article on the Talmud, which would have gained much however by a simpler style and a more lucid arrangement. The author complains of the ignorance of the Talmud so general among Christian and particularly among English scholars, as it is irrational to imagine that we can understand the New Testament without an acquaintance with the ideas and language of a teaching which that book constantly presupposes. He then gives an account of the several treatises contained in the Talmud, and sketches the relations to it of the several Jewish sects. He looks forward, rather quixotically, to the gradual extinction of the controversies rife among Christians, when the data of those controversies are known more accurately through the Talmud, and instances the disputes about Baptism, and the interpretation of passages of Scripture which appear to conflict with science. The Talmud will also throw great light on Biblical criticism. Thus the writer of John xiii. 29, "if aware of the customs of Palestine, which differed in many respects from those of the Jews residing out of Syria, could not have intended to identify the Last Supper with the Passover." The historical interest of the Talmud consists in the mutual relation between the Law and the character of the Jewish people, *i.e.*, if we understand the author aright, the reflexion of the characteristics of the several epochs in the sacred literature of the Jews. There is a paragraph here on the text of the Old Testament Scriptures which somewhat startles us by its conservatism. There are two points on which we could have wished the learned author had been a little more diffuse—the means of determining the date of the several portions of the Talmud literature, and the relation of its religious ideas to those of the New Testament. The former is absolutely omitted; the latter is hastily dismissed in an eloquent peroration which whets without satisfying our curiosity.

### Contents of the Journals.

**Theological Review.** July.—The Chaldean Account of the Deluge, and its Relation to the Old Testament; by A. H. Sayce, M.A. —A valuable but too short essay, beginning with a description of the Assyrian libraries, and the reasons for maintaining the very high antiquity of the Accadian original of which Mr. Smith has discovered an Assyrian version. Mr. Smith's translation of the latter is next given, with the alterations of Izdubar into Gisdhubar or Gisdhumas, and Sisru into Tam-zi (comp. Thammuz). Mr. Sayce then gives his own views as to the critical bearings of this remarkable discovery. He thinks "one of the first results . . . is to demonstrate the untenability of the traditional view of the Old Testament, and to confirm the conclusions of scientific criticism." "On the one hand it confirms the existence of two accounts of the story [of the Deluge] in Genesis, of different age and authorship, one of them, however, being closely modelled after the cuneiform records even in forms of expression; on the other hand, it shows the foreign source and mythical character of the event narrated." There are several points in the essay on which we should be inclined to wish a modification of Mr. Sayce's expressions. It may be doubted whether the general opinion of scholars has been really so unfavourable to Berosus as Mr. Sayce seems to affirm, and whether the moral signification of the Deluge is not implied in Berosus (Xisuthrus was translated for his piety), though certainly less clearly than in the cuneiform account. Then with regard to the statement that "'Orthodoxy,' so called, is deprived of its last resource," &c. Has the discarded theory been most advocated by "orthodox" critics or by rationalists (so far as criticism goes) like Ewald and Kalisch? Is it proved that other stories of mythical origin have not been spiritualized in Genesis? Is there not a higher spiritual element in the Deluge-story of Genesis than in that of the Babylonians? It is surely much to have rejected the solar (if solar) basis and polytheism. And is it so difficult to draw a line between the anthropomorphism of Yahweh and that of Hea and Bel? Surely there may be mythical "survivals" in phraseology at a very advanced stage of religion.—M. Lenormant has already shown in a paper published in the *Correspondant*, and noticed by Mr. Sayce in the *Academy*, that the story of the Deluge belonged to a cycle of epic legends, of which the cosmogony and the Tower of Babel also formed a part. It is as yet quite uncertain whether the story of Paradise and "the Fall" can be traced to a similar origin; I confess to great suspicions of the relevance of the cuneiform Gihon. And even the Tower of Confusion of Tongues is not, as is sometimes supposed, of purely Semitic origin. Mr. Sayce has the credit of having shown clearly what had already been conjectured by Schirren, Gerland, and Tiele that the Deluge-story has a solar basis, and to prevent any ill-natured charge of plagiarism I may mention that I had been already led to the same conclusion (much to my own surprise) by a tolerably wide comparison of various cycles of myths. Mr. Sayce evidently tends to the opinion that the Jehovist, who had so accurate a knowledge of the Babylonian mythology, was one of the Jewish exiles in Babylon, though he admits that "the Elohist is fairly independent in his account of the Flood." Certainly such words as *tebah* and *mabbûl* seem to point to a primitive Hebrew tradition. It is to be hoped that Mr. Sayce may pursue this interesting inquiry further on a monumental basis. The beginning he has here made is full of promise.

### Philosophy and Science.

**Liberty, Equality, Fraternity.** By James Fitzjames Stephen. Smith, Elder & Co.

THIS is an able but unsatisfactory book. The style is throughout vigorous and interesting, though often rambling and prolix, and still more often offensively loud and overbearing: and in respect of what is practically the most important issue raised, the argument if neither original nor exactly sound, is at least opportune and effective. Still, along with a good deal of acute reasoning, the work contains a provokingly large amount of wilful paradox and misplaced ingenuity, confusion of ideas, misrepresentation of opinions, and even downright ignorance of some very well known facts. Perhaps the most striking instance of the latter fault is on the first page, where Mr. Stephen declares that "Liberty, Equality, Fraternity," is the creed of a powerful religion, "of which Positivism is the form best known to our generation," Liberty being afterwards explained to mean "the removal of all restraints on human conduct." What can be said of a controversialist to whom the *Politique Positive* looks much the same as the *Contrat Social*? and who attributes to the system that has "l'ordre pour base" the very revolutionary formula for which it claims to have provided a final euthanasia? Nor is this an accidental blunder. For about half the book Mr. Stephen goes on discussing the legitimate influence of society over the individual, directing his argument against Mill and Comtism alternately, in apparent unconsciousness that his two antagonists hold diametrically opposite opinions on the point at issue. One result of this is to exhibit an entertaining and characteristic inconsistency in Mr. Stephen's own sentiments. In chapter ii. he argues with much earnestness, against Mill, on behalf of "social intolerance," and claims that "after careful consideration and mature study" he has "a right to say such and such opinions are dishonest, cowardly, feeble, ferocious or absurd," evidently believing that he can produce considerable effect by these epithets. But in chapter iii., against the Positivists, he maintains that their "spiritual power"—which might fairly be called a scientific organisation of social intolerance—is "fundamentally impotent," because when they pronounce a man "bad and selfish," he has only to answer "I mean to be bad and selfish and I set you and your spiritual power at defiance." It is difficult to see in the abstract, why a weapon that is so much valued by one party should be so useless to another: or to understand why it should be so much worse to be called dishonest and cowardly by Mr. Fitzjames Stephen than to be pronounced bad and selfish by Mr. Frederic Harrison.

But however little Mr. Stephen may know about Positivism, he has certainly studied Mill on Liberty with some care, and selected, on the whole, the right ground for attacking it. It is undeniable that in this and some other parts of his works Mill seems to forget the essential limits of the empirical utilitarian method which he avowedly employs. It is not possible to obtain by this method any absolute practical axioms: but only general rules of a relative and limited validity. Of this Mill elsewhere shows himself thoroughly aware: as e.g. in his *Representative Government*, where he points out the error of demanding that a political constitution should be thoroughly logical, i.e. should exhibit in all its details the application of some one fundamental principle. But in his treatise on Liberty he expressly says that if his arguments "are not good for an extreme case, they are not good for any case;" which seems to show a complete misconception of the kind of proof which his subject-matter admits. And in his whole discussion of the Liberty of Thought and Discussion, as Mr. Stephen effectively shows, he strives to give a fictitious air of demonstrative cogency to what can be no more than probable reasoning. In so far then as Mr. Stephen is employed in criticising the apparent absoluteness with which Mill's practical principles are enounced his position is very strong: so long as he merely falls back on pure Benthamism as on p. 49 where he gives as his formula that "compulsion is bad

1. When the object aimed at is bad.
2. When the object aimed at is good, but the compulsion employed is not calculated to obtain it.
3. When the object aimed at is good, and the compulsion employed is calculated to obtain it, but at too great an expense."

But in so far as he attempts to establish any practical maxims in opposition to Mill's, he fails just as conspicuously as his opponent and in precisely the same manner. For example, he lays down that it is right to persecute socially opinions (1) if we believe them to be false, and (2) if we have bestowed on them "careful consideration and mature study." This second qualification considerably restricts the number of persecutors: indeed, Mr. Stephen adds that the majority of mankind have no right to any opinions at all, except for the regulation of their own affairs. Now there is obviously just as much *utilitarian* ground for persecuting a true opinion that we believe to be pernicious, unless we assume (which Mr. Stephen does not) that its truth must render persecution futile. The manner in which Mr. Stephen meets this argument is a good example of his headlong style. This "is a suggestion," he says, "which it is childish to discuss in public, because no one could avow it without contradicting himself and so defeating his own object." He might as well argue that it was childish to discuss in public, whether it be right to tell lies under certain circumstances: which would no doubt be the case if the discussion bore upon some particular lie, and was held with the person to whom the lie was to be told. And as to the second qualification, it would be surely easy to assail with the reckless controversial tomahawk that Mr. Stephen wields, the proposition that a conviction sufficient "for the regulation of one's affairs" is insufficient for action on society; and that people have no right to be intolerant of unvaracity or unchastity until after "careful consideration and mature study."

On the one hand then it appears that Mr. Stephen's own construction is logically most imperfect: on the other hand, while dwelling on the formal inadequacy of Mill's arguments to prove their conclusions, he continually ignores their substantial force. E.g. if Mill had contented himself with pointing out that by persecuting legally or socially opinions opposed

to our own, we deprive ourselves of a most important and valuable guarantee for the truth of our own convictions, viz. that given by the free consensus of experts, I conceive that his position would have been unassailable. At any rate Mr. Stephen does not assail it, but contents himself with showing that the guarantee is not strictly indispensable. Such criticism is by no means useless: still, taken by itself it is not only jejune but misleading.

Similarly, he never seems to have understood the very simple argument for Mill's view that the penalties of social disapprobation ought to be confined to offences against society. In the case of these acts—if for any reason they lie out of the reach of the law—the force of the social sanction is generally required to counterbalance the immediate gain to the agent accruing from the act, which otherwise would be actually recommended by rational self-love. But where the consequences of an act fall primarily on the agent himself, a properly enlightened self-love would forbid it: and though we may agree with Mr. Stephen in thinking the social sanction more or less useful in some even of these cases, its influence here is only supplementary to considerations of self-interest.

When we pass to chapter v., on "Equality," we find at the outset a very singular account of justice. Judicial justice, our author thinks, is something altogether different from legislative justice: we call a judge just when he applies a law impartially to all persons included under its general terms, but in calling the law itself just we mean only that it is expedient. Mr. Stephen may mean what he likes by his terms at the risk of being unintelligible; but it seems clear that in both cases alike the common notion of justice implies equal consideration for the reasonable claims of all persons concerned. If justice does not simply direct equality of treatment, it clearly excludes arbitrary inequality. Indeed Mr. Mill shows (in a passage which Mr. Stephen quotes but fails to understand) that even in pure utilitarian ethics the idea of expediency requires this element of justice to explain or supplement it, in order that a complete criterion of right conduct may be furnished: for the same amount of happiness may be distributed in an indefinite number of ways, and therefore we require to be told how to distribute the "greatest happiness" at which we are told to aim.

Our author then begins a discussion of Mill's *Subjection of Women*; but is unexpectedly checked by the consideration that any minute examination of the differences between men and women is—not exactly indecent, but—"unpleasant in the direction of indecorum." We should be sorry to encourage any remarks calculated to raise a blush in the cheek of a Queen's Counsel: but as the only conceivable ground for subjecting women, as a class, to special disabilities, must lie in the differences between them and men, it is obviously impossible to decide on the justice—or if Mr. Stephen prefers it, the "expediency"—of those disabilities, without a careful examination of these differences. And in fact Mr. Stephen's sudden delicacy does not suffice to hinder him from deciding the question with his usual rough dogmatism: it only renders his discussion of it more than usually narrow and commonplace.

The third part of the treatise is so far original that it attacks the one element in Christian teaching which the most virulent antagonists of Christianity have hitherto left unassailed—the sentiment of human brotherhood. In discussing "Fraternity" Mr. Stephen seems to confound two very distinct issues, how far men actually do love each other, and how far it would be for their mutual benefit that they should. Sometimes, indeed, the discussion seems to be almost narrowed to the question whether Mr. Fitzjames Stephen loves his fellow-men: which, he assures us, is only the case to a very

limited extent. Life, to Mr. Stephen, would be intolerable without fighting: a millennium where the lion is to lie down with the lamb, presents to him a very flat and tedious prospect: he has no patience with the sentimentalists who insist on pestering him with their nauseous affection. These facts are not without interest for the psychological student: and we may admit that they exhibit forcibly the difficulty of realizing the evangelical ideal. But we can scarcely treat them as serious arguments against the practical doctrine that any possible increase of mutual goodwill among the members of the human family is likely to be attended with an increase of their common happiness. "Yes, but what do we mean by 'happiness'?" Mr. Stephen would reply. Certainly he does not clearly know what he means by it. He generally assumes that every one must necessarily wish to impose his own idea of happiness upon every one else: indeed in one place he goes so far as to say that if two persons' views of what constitutes happiness are conflicting, they cannot have a mutual wish for each other's happiness. Yet Mr. Stephen is elsewhere perfectly aware that "every man's greatest happiness is that which makes him individually most happy, and of that he and he only can judge." What confusion this double view introduces into his utilitarian arguments, we need scarcely indicate. And there are many similar confusions: in fact we continually find Mr. Stephen assuming in one place without hesitation a common opinion against which he elsewhere directs page after page of more or less ingenious sophistry. Throughout the book, too, there is a great want of clearness of method: applications of utilitarian principles and appeals to popular prejudices, the logic of Bentham and the rhetoric of Carlyle, succeed each other with bewildering incoherence. HENRY SIDGWICK.

### Notes on Scientific Work.

#### Geography.

**Khiva.**—The first of a series of papers illustrated by maps of original value, in which the geographical results of the Khivan campaign will be collected, appears in the number of *Petermann's Mittheilungen* about to be published.

This report consists of a number of letters from Lieut. Hugo Stumm, of the Westphalian hussar regiment, who accompanied the detachment under Col. Lamakine from Kinderli Bay on the Caspian, along the southern edge of the plateau of Ust-Urt, describing the country as far as Fort Ilte Idshe, half way to the sea of Aral, and accompanied with a route map of the country traversed. The clearly-marked southern edge of the Ust-Urt falls almost perpendicularly to the plain beneath, from a height varying from 200 to 500 feet; its dark escarpment often presents wild ravines with caves and water-worn channels, cut through the horizontal strata.

From the base of this cliff, which is undoubtedly the former margin of the Caspian, the ancient sea bed stretches away to southward in undulating plains of sand, with here and there higher dunes and deeper hollows in which dry salt beds appear.

Wells occur at irregular intervals and form the only fixed points in the wide desert, since it is round these that the wandering Kirghiz build the graves and place memorial stones to their dead. Almost without exception these wells are cisterns, not springs, and to the formation of these Lieut. Stumm has given particular attention. The rapid variations of weather in this bare region have also been studiously observed, and several tables giving the temperature of the air and sand with the direction of the wind at short intervals during the day accompany the letters.

A second paper, by Dr. Sievers at Tiflis, also admirably illustrated by a map from Russian sources, describes the military expedition of December, 1872, to the bed of the Oxus, thence to the Kurren-Dagh and to the valley of the Attrek. The channel of the Oxus, which was examined as far as the well of Igdy, has an average depth of 60 to 70 feet, and its sides are steeply cut down into the regularly stratified clay soil. The moisture still finding its way into the channel has induced a considerable amount of vegetation along the river line, which appears almost luxuriant to the wanderer on the arid steppe. An unbroken plain of sand lies between Igdy and Kizil-Arvat, near the base of the Kurren-Dagh in the south. Kizil-Arvat is the most westerly of fifty-nine fortifications built in former years by the Tekke Turkmen along the fertile northward slope of the Kurren-Dagh. The fort, now abandoned,

is of a square form, with clay walls of sixteen feet in height enclosing a citadel with towers and cistern. The channel of the Attrek resembles that of the Oxus in every particular, though on a smaller scale, until its mouth is nearly reached, where the banks become low and flat and the river is surrounded by reedy saline swamps. The Turkmen say that the volume of the Attrek has greatly diminished of late so that in summer the river scarcely reaches the Caspian, and the ultimate fate of this river will probably be that of the Caspian arm of the Oxus.

The latest parts of the *Russische Revue*, an excellent periodical, in German, recently established in St. Petersburg, contain a valuable historical sketch of Khiva by M. Lerch.

#### Physiology.

**Experimental Researches on the Functions of the Brain.**—A valuable paper on the functions of the brain appears in the current number of *Virchow's Archiv* (lvii. 12) from the pen of Dr. Nothnagel, giving a provisional or anticipatory summary of the conclusions at which he has arrived. His experiments have been carried on in Prof. Heidenhain's laboratory at Breslau. The animals experimented on were rabbits, which, though in some respects inferior to dogs for the purpose, can readily be obtained in considerable numbers. Nothnagel, after discussing the advantages and disadvantages of the various methods that have been employed for determining the functions of different parts of the brain, such as the removal of parts by slicing them away, the section of portions with a fine knife through a small opening, and the application of electricity, proceeds to describe the following plan suggested to him by Prof. Heidenhain. He divides the skin of the head by a simple cut and perforates the skull with a boring instrument made from a microscope-needle. Through the hole thus made he passes the canula of a fine Pravaz' subcutaneous-injection syringe and injects into the desired part from quarter to half a drop of concentrated chromic acid; the canula is then withdrawn and the wound of the skin closed. Except in cases where the injection entered the ventricles of the brain, when death took place in from ten to thirty minutes, the animals lived as a rule from one to three weeks. Death within three days was of rare occurrence. When the acid penetrated the ventricles it ran through the foramen of Monro into the third and fourth ventricles of the brain; great retardation of the pulse and dyspnoea followed. After a time the frequency of the heart's action increased and general convulsion occurred which terminated in death. In cases where death took place after the lapse of about four-and-twenty hours post mortem examination showed that the part where the injection had penetrated was green and hard, so that sections could readily be made from it. When the animals lived a little longer there was developed around it a zone of inflamed brain of about one millimeter in breadth. Pursuing this method of examination Nothnagel injected acid in the first place into the hemispheres. He found the animal remained quiet during the operation and was subsequently lively and ate well. Its motility was apparently undisturbed, and no sensory disturbance could be detected. If the injection were made into the left hemisphere the right forefoot could be placed in any position, provided this were done slowly, without its being retracted, though similar attempts with the left forefoot were promptly resisted. The animal will sometimes remain in an abnormal position for several minutes. If the skin be slightly pinched the leg is however immediately retracted. When the animal lived over a week or so this peculiar condition became less and less marked. There was no corresponding condition in the hind limbs. A similar experiment on a dog gave the same results. The explanation which M. Nothnagel regards as the most probable is that the animal has no ideal representation or only an incomplete one of the position of the extremity; in other words, there is partial paralysis of the muscular sense. He finds however from other experiments that there is no very strict localisation of mental functions in definite centres situated in the cortex of the cerebrum. Nothnagel finds lesion of the lenticular nucleus is always followed by motor paralysis but not necessarily by sensory. Injection into a definite point at the anterior and inner part of the corpus striatum (nucleus caudatus) gave the following results: For the first two or three minutes or even longer the animal remained quiet, but gave the impression of being conscious. Then without the slightest external irritation it began to leap either straight forward or performed the *mouvement de manège*. It made from four to eight leaps, then sat still for a few seconds, then leaped again, and so on, the movements being always hasty, the pause shorter and shorter till at length the movements became continuous, and after five to eight minutes it fell over on its side, the legs moving violently. In the course of a quarter or half an hour the animal was quite exhausted and lay apathetic. The point of the brain which when irritated produced these effects Nothnagel calls the *nodus cursorius*.

**The Changes of Muscular Tissue after Section of the Nerves.**—C. Bizzozero and C. Golgi in a paper on their researches which appears in *Stricker's Jahrbücher*, 1873, Heft 1, state that on the 10th January, 1870, they removed a long piece of the right sciatic nerve from a rabbit six months old. The tibiotarsal joint on the operated side gradually thickened, and after four or five weeks an ulcer made its appearance and the lym-

phatic glands swelled. In other respects the animal remained in pretty good health. On the 20th August a portion of the crural nerve was excised from the same limb. The animal seemed very well up to the 9th November. In December the ulcer had increased considerably and assumed an unhealthy aspect, and the animal soon died. On post mortem examination it was found to be very lean. The connective tissue of the whole lower extremity was infiltrated with serum. Ulcers had formed at various points and beneath them were cheesy deposits surrounded by a dense capsule of connective tissue. The stumps of the divided nerves were separated from each other by a considerable interval. The superficial muscles of the thigh had a pale rose tint; the deeper ones a yellowish red. The superficial muscles of the lower leg were greyish red and in parts yellowish, were rather hard to the touch, and were easily torn. The deep muscles, which had increased about one-third in thickness, presented a uniform yellowish colour and on section appeared smooth, uniform, and lardaceous. Microscopical examination showed that in the superficial muscles of the thigh there were scattered groups of fat-cells linearly arranged, which appeared to correspond to the course of the nerve-fibres. In the deep muscles of the thigh the muscular fibres were thin and the transverse striæ ill marked, and between the muscular fasciculi of the first and second order numerous very distinct zones of fat-cells were observed. In other parts the muscular substance of the individual fibres was partly torn in pieces and partly replaced by fat-cells. The superficial muscles of the lower leg presented in a very marked form the usual consequences of nerve-section, namely proliferation of nuclei in the muscle-corpuscles, atrophy of the fibres, increase of the interstitial connective tissue, and abundance of fat-cells between the muscular fibres. Lastly, in the deep muscles of the lower extremity, where the muscles were yellowish and like bacon, no trace of muscular tissue was visible; it appeared to be altogether converted into adipose tissue which might be compared with the panniculus adiposus. In transverse sections the fat-cells were rounded or polyhedral and resembled a mosaic. In longitudinal sections they were serially arranged, corresponding with the fasciculi.

**Changes taking place in Inflamed Corneæ.**—V. Pfungen has recently undertaken some interesting investigations in Stricker's laboratory and published his results in *Stricker's Med. Jahr.*, 1873, Heft 1. V. Pfungen passed threads through the centre of the corneæ of frogs and then examined the changes that took place in the cells by tinting them with gold or with silver and gold and placing them under a Hartnack's No. 10 immersion system. The precise method of preparation adopted in the latter case was to cut out the cornea and place it in a 5 per cent. solution of ordinary acetic acid in distilled water for a minute or two, in order to remove any blood that might be adherent as well as the anterior layers of epithelium. The cornea was then placed for five minutes in a one-half per cent. solution of silver, then replaced in the acetic acid solution for a minute or two, then immersed for ten minutes in the solution of gold, and finally for a few minutes in the acetic acid solution; the tissue was then carefully broken up. The chief result of his investigations is that he has determined that the pus cells of inflamed corneæ proceed from the nuclei of the ordinary fixed corpuscles.

**The Reflex Movements of the Uterus.**—A paper with this heading appears in *Stricker's Med. Jahrbücher*, 1873, Heft 1, by Dr. W. Schlesinger. Schlesinger and Oser some time ago showed that dyspænic arterial blood induced contraction of the uterus partly through the irritation of a nerve centre for the uterine nerves situated in the cranium and partly owing to the irritation of excitable tissues in the uterus itself. In the present investigation he has observed the effects of the electric excitation of the nerves of the spinal cord and has ascertained that electric excitation of the centric extremity of a divided dorsal spinal nerve causes general and energetic uterine movements in from five to fifteen seconds, the reflex action taking place through the cranial centre. Schlesinger was unable to corroborate Scanzoni's statement that irritation of the nipples causes uterine contraction, but he operated on very young animals. Schlesinger further shows that although excitation of the nervous plexus surrounding the aorta causes uterine contraction this is not the only path by which the motor impulses are conducted.

Prof. Gegenbaur, of Jena, whose Handbook to Anatomy is about to be translated, has accepted a call to Heidelberg.

### Geology.

**New Tertiary Mammals from the Rocky Mountains.**—Prof. O. C. Marsh continues his description of new genera and species of tertiary mammals from the Rocky Mountains, collected during the recent expeditions from Yale College. The new genus *Tillotherium* possesses some remarkable dental characters differing from any yet described, but may probably prove to be nearly related to *Anchippodus*, if additional remains of that genus are discovered. *T. hyracoides* possesses two large incisors in each premaxillary, the inner and larger being gliriform, and subtriangular in transverse outline, the posterior faces being concave and covered on the front and outer surfaces with enamel. The canine is small and directed well forward. There are

four upper premolars increasing in size posteriorly, and three true molars, the last being the largest and all greater transversely than in antero-posterior dimension. They are composed of a pair of external cones, connected with a single internal lobe by two oblique converging ridges, and there is a small tubercle in the depression thus enclosed. The basal ridge on the posterior side is expanded, forming a low shelf, and the antero-external cone has an outer cusp which projects outward and forward. The lower jaws and skeleton are not yet known and Prof. Marsh believes that they may eventually prove to be identical with *Anchippodus minor*. The animal was about two-thirds the size of a tapir, and is from the Eocene of Wyoming. An examination of the remains of mammals allied to *Titanotherium* shows that two different animals have been hitherto referred to the species known as *T. Prouti*. The one now described under the name *Brontotherium gigas* differs from *Titanotherium* in having only three lower premolars, and is a true Perissodactyl, with limb bones resembling those of rhinoceros. Though generically distinct it is yet related to *Titanotherium* and Prof. Marsh unites the two genera under the family name *Brontotheriidae*. The remains of *B. gigas* are found to be those of an animal nearly as large as the elephant. The lower molars resemble those of *T. Prouti*, but the jaw is not so deep and its lower margin is straighter, descending but very slightly towards the angle. The incisors are small, the two next the symphysis being separated from each other, while there is a short diastema between the canine and first premolar. The other portions of the skeleton possess the following characters. The femur has a third trochanter, and its head a pit for the round ligament. The astragalus is remarkably short, and has a deep groove on its upper surface, and the articular facets for the navicular and cuboid are nearly equal. In the manus there are four short and thick toes, the first digit being rudimentary. There were three digits only in the pes, the first and fifth being wanting. The metacarpals and metatarsals are longer than in the elephant and the phalanges shorter. The carpal and tarsal bones are very short and form interlocking series. The tail is long and slender. The new species *Elotherium crassum* presents some features not observed hitherto in any Ungulates. There is a very long process descending from the malar bone, and giving attachment to the masseter muscle. It resembles the downward prolongation from the zygomatic arch in some Edentates and Marsupials, but is longer and more compressed. The radius and ulna are separate or very loosely united. The third and fourth metacarpals are nearly equal in size, and the second and fifth are larger than the corresponding bones of the pes. The hoof phalanges are short. This species is intermediate in size between *E. Mortoni* and *E. ingens* and like *B. gigas* is found in the Miocene of Colorado.—(*American Journal of Science and Art*, No. 30, 1873, p. 485.)

**A New Fossil Bird from the London Clay of Sheppey.**—At the last meeting of the Geological Society of London, held on June 25th, Prof. Owen described the skull of a dentigerous bird found in the London Clay of the Isle of Sheppey. The specimen consists of the brain-case with the basal portion of both jaws. The remarkable characteristic of this skull is the denticulation of the alveolar margins of the jaws. These denticulations are of two sizes, the larger ones being from two to three lines in length and separated by intervals of about half an inch, the smaller being about half a line in length and occupying the space between the larger denticles. They are all of a triangular or compressed conical form. Sections of these denticles seen under the microscope exhibit the unmistakable characters of avian bone. The total length of the skull, judging from the proportions of the parts preserved, would be between five and six inches, the length behind the fronto-nasal suture being two inches five lines. The author gives the name *Odontopteryx toliapicus* to this fossil. The distance of the nostrils from the orbits, the absence of the superorbital gland pit, and other peculiarities point to the Goosanders and Mergansers as near allies, both of which have the beak strongly denticulated. In these, however, the denticular processes are on the horny bill only, so that this modification of the alveolar margin of the jaws is peculiar to *Odontopteryx*. Prof. Owen considers "that *Odontopteryx* was a warm-blooded, feathered biped, with wings; that it was web-footed and a fish eater; and that in catching its slippery prey it was assisted by this pterosaurid armature of the jaws."

**The Volcanoes of Ecuador.**—Wolf, in a letter to Prof. vom Rath (*Zeitschrift der deutschen geologischen Gesellschaft*, vol. xxv. part 1, p. 102) describes some of the lava streams in the vicinity of Quito, Ecuador. He states that it is erroneous to suppose that these volcanic mountains consist almost entirely of a homogeneous trachyte, for wherever he has examined them he has found the lava streams made up almost entirely of varieties of Andesite. These streams are exceedingly numerous and constitute the bulk of the volcanic rocks of the country. At Langlangchi the lava forms a high perpendicular wall which appears to be the end of a stream reaching to the plateau of Riobamba. It exhibits very beautiful columnar structure, and consists of Andesite, which at the bottom and towards the middle possesses a porphyritic texture, becoming gradually more compact and darker in colour until at the surface it passes into a porous slaggy lava. It has a height of nearly thirty metres and a breadth of nearly a mile. Going from Langlangchi over Lican to Chimborazo, one traverses several extensive lava streams, while at

Tunguragua there are two of these streams as fresh in appearance as if they had flowed but a few days since. All the Ecuador volcanoes, Chimborazo not excepted, exhibit numerous lava streams. Not to mention the older perlite and obsidian streams of the same volcano, it would be difficult to find in any part of the world a more beautiful example than that presented at Antisana, which probably flowed in the last century. The whole foot of Chimborazo is surrounded with radiating streams of a black porous lava exhibiting columnar structure, and in some instances consisting of a clear compact Andesite. The mountain of Imbabura is built up entirely of columnar lava and all the smaller volcanoes in its vicinity have long and broad lava streams. All these streams contain numerous varieties of Andesite, and in most cases Wolf has observed them to have their origin in the sides or foot of the mountains and not at the crater summits.

### Botany.

**Classification and Geographical Distribution of Compositae.**—The last part of the *Journal of the Linnean Society* contains Mr. Bentham's long-promised paper on the Compositae, to which we have already alluded (*Academy*, vol. iii. pp. 73, 152). He divides this enormous order, the largest and most natural in the vegetable kingdom, into thirteen primary divisions, viz., 1. *Vernoniaceae*, 2. *Eupatoriaceae*, 3. *Asteroidae*, 4. *Inuloideae*, 5. *Helianthoidae*, 6. *Helonioidae*, 7. *Anthemideae*, 8. *Senecionideae*, 9. *Calendulaceae*, 10. *Arctotideae*, 11. *Cynaroideae*, 12. *Mutisiaceae*, and 13. *Choriaceae*; the main characters relied on being the differences in the sexual arrangements, in the pistil (but only in the hermaphrodite flowers, where its sole function appears to be that of sweeping the pollen out of the anthers), in the androecium, in the corolla, and in the calyx (pappus). The relations of these subdivisions to one another, both structurally and in their geographical distribution and probable genetic connection, is traced out with very great care; and the probable history of the order is thus summed up:—Africa, West America, and possibly Australia, probably possessed the order at the earliest recognizable state, Andine America showing what may be considered the nearest approach to the primitive form of the order. These regions had probably at that time some means of intercommunication, and it was only at a later period that the Compositae began to disappear from the tropical regions, which henceforth placed an impassable barrier between the northern and southern hemispheres. Those more or less differentiated races which had reached and accommodated themselves to high northern latitudes or mountain altitudes retained some means of communication between the Old and the New World long after it was broken off in the warmer parts of the globe. The homes where the Compositae now flourish in the greatest luxuriance as regards specific variety and individual numbers appear to be—Tropical America exclusive of the great alluvial low-lands and forest regions, the United States, South Africa, the Mediterranean region, West Central Asia, and extra-tropical Australia.

**Concealed Chlorophyll in Plants.**—M. Prillieux (*Comptes Rendus*, June 26th) discusses the structure of the bird's-nest orchis (*Neottia nidus-avis*), which is generally considered a non-parasitic plant not containing chlorophyll. He observed that if a plant is placed in alcohol it turns green and then imparts that colour to the alcohol. Under the microscope it is seen that the brown colour of the petals is due to small elongated brown bodies scattered without order through the cells and grouped round the nucleus in each cell. These bodies have the power of swelling and are what he regards as proteinaceous analogues of crystals. The application of alkalis or acids, or even of heat, immediately turns them green, and any re-agent which dissolves chlorophyll itself in like manner becomes green. M. Prillieux believes, however, that chlorophyll does not exist as such in the living plant, the most careful experiments showing no disengagement of oxygen, but rather of carbonic acid; the chlorophyll is probably rather a product of the action of the re-agents applied. The tissues contain abundance of starch, which they probably absorb in that state.

### Philology.

**The Vamgabrāhmana** (being the eighth Brāhmana) of the Sāmaveda. Edited, together with the Commentary of Sāyana, a preface and index of words, by A. C. Burnell, M.R.A.S., &c., &c. Mangalore. 1873. (pp. xliii., 12, and xii.)

THE main interest of this little volume consists in the preface. The Brāhmana itself, together with its commentary, occupies no more than 12 pp., and, as the editor tells us, is a mere list of names of the successive teachers of the Sāmaveda, the lowest in the list appearing to be those of historical persons, though there is nothing to indicate to what period they belong—while the earlier names are purely mythical.

In the preface, among other matters, Mr. Burnell discusses the question whether the celebrated mediæval Indian scholar Sāyana, who composed the well-known commentaries on the hymns of the Rigveda and on different Brāhmanas, was the younger brother of Mādhava, to whom other works of the same description are ascribed, or whether the two persons were identical. On this and other points connected with Sāyana he adduces a number of particulars which, to me at least, are new; and arrives at the conclusion that the two names denote one and the same individual. According to the Telugu Brahmins, as Mr. Burnell tells us, Sāyana was perhaps the son of Māyana; and he was probably an only surviving child, who received the name he bore (which is more properly Sāyana, and is a pure Dravidian word signifying "mortal") as one of those names which are given by parents in Southern India who have lost several children to

a child subsequently born, with the view of propitiating the malignant powers which are supposed to have destroyed the others. His real name as a Brahman, however, was Mādhavāchārya, who took the appellation of Vidyāranya Svāmin. If he had brothers the name of Sāyaṇa shows that he must have been the eldest ("anna" [= elder brother] being an ordinary honorific complement of South Indian names). It is further urged by Mr. Burnell that, in a verse of the Pārāśarasmitivṛyākhyā, Mādhava says of himself that Śrīmātī was his mother, Māyaṇa his father, Sāyaṇa his "lord of enjoyment" (*bhoganātha*), and Manas and Buddhi (the perceptive and reasoning faculties) his brothers. The term "lord of enjoyment," as Mr. Burnell believes, receives its explanation from the Vedānta philosophy, in conformity with which Mādhava is the soul, which is one with Viṣṇu (who in one of his incarnations has Mādhava for one of his names) and becomes clothed with a human body, through which sensual impressions are received, and which is called *bhoga-yatanam* or *bhogasādhanaṁ*, the "abode of" and "means to" sensual impressions, but is here personified as the "lord of enjoyment, or of sensual perceptions." In support of his view, Mr. B. quotes another verse where Mādhava, "having the body of (or embodied in) Sāyaṇa," is said to have expounded the Vedas; and two more, in which Mādhava is described as the kaustubha gem produced from the Sāyaṇa-milk-ocean, and the names of Sāyaṇa and Mādhava are associated in one compound word—in which the dual form is not employed, as it might have been expected to be if two distinct persons had been intended. Another verse which speaks of Mādhava as suggesting to King Bukka that his own learned younger brother Sāyaṇa should be commissioned to interpret the Vedas—and which therefore appears to militate against the identity of the two—is understood by Mr. Burnell to signify that Mādhava here refers to himself as the soul, which is eternal, and necessarily anterior to the body,—here represented by Sāyaṇa—which was produced in time. And he repeats that, as above explained, Sāyaṇa can only be the name of an elder brother. Lastly, it is remarked that whereas, in the earlier Vedic commentaries of this author, King Bukka is said to have commanded Mādhava to compile these works, whilst in the colophons they are spoken of as the work of Sāyaṇa, in the later commentaries it is more consistently stated that they were ordered to be composed by Sāyaṇa, who also appears in the colophons as the author.

The praise of ingenuity cannot be refused to these arguments, and they further appear to me to possess great force. It would, however, perhaps be premature to pronounce whether or not they are absolutely conclusive until they shall have been examined by other Sanskritists, and until it shall appear whether any other data bearing on the solution of the question are forthcoming or not.

Sāyaṇa became, as Mr. Burnell relates, the ascetic head of an important religious sect founded by the famous Saṅkara āchārya, the chief monastery of which was Śringerī, in Southern India, where his successor in the government of the order still resides. Here he had abundant leisure for the composition of voluminous works, which are enumerated by Mr. B., the chief period of his literary activity appearing to range from 1350 to 1380 A.D. Mr. Burnell states that a revival of Vedic studies seems to have commenced about 800 A.D., and to have lasted not much beyond 1500; and he considers that the appearance of Sāyaṇa's earlier works induced the pious Hindu sovereign Bukka to commission him to expound the Vedas, a plan which formed part of the measures which he took to restore Hinduism, and which Sāyaṇa nearly completed. Mr. B. is of opinion that the works which pass under Sāyaṇa's name were really written

by him, and that there are no grounds for supposing that he lent his name to the compositions of others. The inconsistency discoverable between the interpretations which he has given in different books is to be explained by the nature of the works; and circumstances rendered it impossible for him to be a consistent critic. The Vedānta, which he explained, is in contradiction with the old Vedic religion; and as Sāyaṇa proceeded on the erroneous assumption that all the Vedic texts are in harmony with each other, he could not, when proceeding on this hypothesis, do otherwise than pervert the sense of some of them in his expositions. The productions of his predecessors in the same field, including the remains of the ancient etymological school of Yāska, constituted, according to Mr. B., the principal source from which Sāyaṇa compiled his own works; though as regards the books which he consulted for his Rīgveda Bhāṣya but little information remains.

After examining the pre-existing materials which the commentator who is the subject of his discussion appears to have had at his disposal to aid him in his interpretation of the Vedic hymns, Mr. B. comes to the following conclusion: "The great controversy which has prevailed so long respecting Sāyaṇa's competence to explain the Vedas is fast approaching its end: the above sketch of his life and works will show that the followers of the 'German school' are historically right. That they are so theoretically is established by an amount of proof," offered by the scholars whom the writer proceeds to name, "that has long vanquished all reasonable hesitation on the part of the Sanskritists who were once inclined to prefer Sāyaṇa and Indian precisians to the results of comparative philology."

I may explain that the "German school" consists of those Sanskritists who maintain, in opposition to the late Professors H. H. Wilson and Goldstücker, that, in interpreting the ancient hymns of the Veda, European scholars ought not to regard themselves as bound by the expositions of Sāyaṇa (who often gives alternative, and consequently, in his own view, dubious, explanations, and who viewed the ideas of the ancient poets in the light of his own age); but, while accepting all the aid that the Indian commentator can afford, should endeavour to elicit the real sense and spirit of those hymns by the help of the context, by a comparison of parallel passages, by transplanting themselves into the remote past and seeking to think its thoughts, and by the other improved methods of modern philology.

From the preceding summary of its contents, it will be manifest that Mr. Burnell's preface forms an extremely interesting and important contribution to the literary history of mediæval India.

J. MUIR.

**The Dialect of the Southern Counties of Scotland.** By J. A. H. Murray. London: Asher & Co. 1873.

MR. MURRAY'S work consists of two distinct portions—(1) the historical introduction, (2) the phonology and grammar of the modern dialects. We will consider them separately. The most important of the general results of Mr. Murray's historical investigations is the confirmation they give of the view first advanced, we believe, by Mr. Garnett, that the Scotch dialects are essentially a subdivision of the old Northumbrian, which in the fourteenth century was spoken as one homogenous language from the Humber to the Forth; they are in short *English* dialects—quite as much so as the popular speech on the other side of the Tweed. Mr. Murray says: "I have repeatedly been amused on reading passages from Cursor Mundi and Hampole to men of education, both English and Scotch, to hear them all pronounce the dialect 'old Scotch.' Great has been the sur-

prise of the latter especially, on being told that Richard the Hermit wrote in the extreme south of Yorkshire, within a few miles of a locality so thoroughly English as Sherwood Forest, with its memories of Robin Hood." Indeed, down to the end of the fifteenth century the Lowland tongue is never once called "Scotch," but always "Inglis"—

"Lykly he was, manlik of contenance,  
Lik to the Scottis be mekill governance  
Sauf of his tong, for Ingliss had he nane,"

is said of Wallace's French friend Longueville.

One curious result (already pointed out by Garnett) of the identity of old Scotch and Northern English is that earlier Scotch philologists, especially Jamieson, claimed all the northern romances as Scotch, and thus practically ignored the Northern English altogether. They then, as Mr. Murray observes, proceeded to compare their old Scotch with purely Southern writings such as Layamon, and on the strength of the distinctions of spelling and inflexion that manifested themselves, claimed for the Scotch an origin independent of Anglo-Saxon, which origin they sought either in Pictish or in Jamieson's favourite "Suio-Gothic."

We must, *en passant*, protest against Mr. Murray's assertion that the dialectology of the thirteenth and fourteenth centuries "was all but a *terra incognita* when taken up by Dr. Richard Morris." Many people nowadays seem to have a vague impression that English philology had no existence at all before the appearance of Dr. Morris and the Early English Text Society. The fact is that if we subtract from the views now current on the Early English dialects the large amount of pure guesswork that they contain, we shall find that nearly all the results of real importance embodied in them were perfectly well known to Garnett and his fellow-students, Madden and Guest, long before any of the editors of the Early English Text Society were heard of.

It is a significant fact that the oldest specimen of the language of the North Angles—perhaps the oldest specimen of any English dialect we possess—belongs to Scotland. This is the Runic inscription on the Ruthwell cross in Dumfriesshire, which can hardly be of later date than the beginning of the eighth century. Mr. Murray gives it in full from Professor Stephen's text. After the Durham-book glosses of the tenth century the history of the Northern dialect in Scotland can only be traced in isolated words occurring in the Latin laws of David I. and his successors, such, for instance, as "*Si quis verberando fecerit aliquem blaa et blodi, ipse qui fuerit blaa et blodi debet prius exaudiri.*"

Beginning then with the fourteenth century Mr. Murray divides the language into three periods:—

(1) The *early*, up to about 1450, in which the literary use of the northern dialect was common both to Scotland and England.

(2) The *middle*, 1450-1700, during which the literary use of the dialect was confined to Scotland. This period is characterised by certain phonetic changes, and by strong French influence.

(3) The *modern* period, in which the literary use of the northern dialect ceased in Scotland also, so that it only survived as the speech of the common people.

In treating of the peculiarities of the middle period Mr. Murray has satisfactorily explained the puzzling confusion of *a* and *ai*, *o* and *oi*, &c., in the same words (*tail*, *rois* = *tale*, *rose*), by showing that the *i* was simply a mark of length, resulting from a defective pronunciation of original *ai*, &c., in which the second element sank to a mere vocal murmur, so that *aa* and *ai* came to be almost undistinguishable in sound, and were therefore interchangeable. This change, together with that of *wh* into *f* in the north-east dialects, and the dropping of initial *th* in

*at that* (the *màn at was heir*) are explained by Mr. Murray as due to Celtic influence. These questions of the influence of one language on another offer peculiar difficulties, because of the possibility of the same phenomena developing themselves independently, but Mr. Murray seems to have made out his point satisfactorily in these three cases. He has, at any rate, clearly proved the superior claims of Celtic over Norse influence as regards *at* for *that*, showing that on the Gaelic border the loss of initial *th* extends to all unemphatic words, which is not the case in Norse. In one case we must consider the Celtic influence as more than doubtful—in that of the triple use of *thys*, *that*, and *yon* in the senses of the Latin *hic*, *iste*, *ille*, which Mr. Murray asserts to be non-Teutonic. He must surely have forgotten Dutch, which uses the same three words (in Dutch *dit*, *dat*, *geen*) in exactly the same way. There is therefore no necessity for calling in the very different Gaelic forms *an* (*duine*) *so*, *an* (*duine*) *sinn*, *an* (*duine*) *ud*, as Mr. Murray has done: we must rather assume that the distinction was developed independently by all three languages.

In treating of the third period Mr. Murray makes some very interesting remarks on the revival of the Lowland Scotch in the works of Scott and Burns. He makes out the modern literary Scotch to be a thoroughly artificial and conventional language. Not only is the spelling anglicised, but the grammar and vocabulary has also been greatly corrupted by the influence of the literary English. And while Scott and Burns have thus unconsciously anglicised their native idiom, other writers have done so consciously and systematically, regarding all deviations from the literary standard as "bad grammar." As an example of this "fancy Scotch" Mr. Murray quotes "*Scots wha hae wi' Wallace bled*," which is a mere *transliteration* of the English "*Scots who have*:" the genuine Scotch would be "*Scots at haes*."

We may now turn to the phonology and grammar of the living dialects, which Mr. Murray divides into three principal groups—the north-eastern, central, and southern. The last, as spoken in Teviotdale, is Mr. Murray's native dialect, and on it his observations are principally based. The value of these observations is greatly increased by their being expressed in a rigorously consistent and minutely accurate phonetic notation, based on the traditional Scottish orthography, the formation of each sound being carefully explained with references to Mr. Bell's *Visible Speech* and Mr. Ellis's *Palaetype*. Mr. Murray is justly severe in his condemnation of the slovenliness of most writers on dialects in matters of pronunciation and notation: "It is a matter of deep regret that nine-tenths of what has been written in or on the dialects is, for philological purposes, positively useless, from the want of any clear explanation—often of any explanation whatever—of the values which the writers have attached to the combinations of letters employed by them. It cannot too often or too loudly be repeated that words are combinations of *sounds*, not strings of *letters*, and that to attempt to describe an unknown language or an unknown dialect by spelling its words in such and such a manner, without rigidly defining the values attached to the letters, is as futile as it would be to represent to us a landscape with its various parts not only uncoloured, but labelled with the names of their divers hues and shades in an unknown tongue."

It will give some idea of the delicate sound-distinctions of the Scotch dialects to know that Mr. Murray finds it necessary to distinguish *nine* instead of merely *three* degrees of tongue elevation in the case of some of the vowels. Thus, in the front vowels he recognises, besides the normal mid primary (*e*), a higher vowel (*ê*), between (*e*) and (*i*), and a lower (*è*). The higher is the Edinburgh, the lower the Teviotdale sound. The peculiar vowel in *hill*, *bit*, &c., is

identified by Mr. Murray with the wide sound of the Edinburgh (*è*): *hill* is therefore *hél*.

It is clear that Mr. Murray would not agree with the dictum of a well-known German dialectologist, who saves himself the trouble of giving an accurate and intelligible account of the sounds of his dialect by laying down the principle that no shades of pronunciation must be recognized which cannot be expressed by the letters of the Roman alphabet in their conventional acceptation. The only sound principle is, of course, to note every distinction that can be heard and analysed, and not to dogmatise till a few more trustworthy observations have been made.

It is impossible to follow Mr. Murray through the details of his masterly analysis, although many of them are of the highest interest. Such are the remarks on the palatalization and labialization of the guttural *ch* (peculiar to the southern dialect), and the light they throw on the history of the same sound in the literary English. Another peculiarity of the dialect—the diphthongization of final *ee* and *oo*—is also of great value as illustrating the development of diphthongs generally. Finally we may mention archaisms, such as the preservation of *w* not only before *r* in *wrang*, &c., but also before *l* in the word *w'list*, which last Mr. Murray has heard in his childhood from old Teviotdale villagers.

The grammar fully maintains the high character of the earlier portions of the work: the details of inflexion and syntax and of the use of the auxiliaries show the same unique combination of historical research and keen appreciation of the features of the living language. Mr. Murray entitles this part of his work simply a "Grammar of the Southern Scottish Dialect:" it would be almost nearer the truth to call it an "Historical Grammar of Northern English." Errors which have been handed down unquestioned from the days of Garnett and his contemporaries are here cleared up. The general assumption, for instance, that the inflexion of the present tense of the thirteenth century Northumbrian verb was *s* throughout is corrected by Mr. Murray, who shows that the thirteenth century usage was the same as that of modern Scotch, in which the *s* of the plural is dropped when a verb is accompanied by its proper pronoun, although retained in other cases: *thay syt*, but *the men syts*.

It is to be regretted that the dialectical specimens given in the appendix are so scanty: they consist only of the Book of Ruth in Teviotdale, accompanied with renderings of the first chapter into the Buchan and Ayrshire dialects, to represent the two other groups. We hope Mr. Murray may be induced to crown his work by preparing a much fuller Chrestomathy of his native dialect, for which there must surely be material extant in the shape of popular traditions, songs, proverbs, &c., together with a complete dictionary. Scotch patriotism, which is too often wasted in high-flown declamations about Wallace and Bruce, might find a rational outlet for its superfluous energy in forwarding the completion of so truly national a work. HENRY SWEET.

### Intelligence.

Mr. George Smith, whose archaeological mission to Mesopotamia will be in the recollection of our readers, returned to England on the 19th inst. The three boxes of antiquities which he had prepared to bring were detained by the governor of Alexandretta, but have since been released by an order from Constantinople, and are on their way to this country. Mr. Smith has found portions of the Deluge-tablets completing the text, parts of cylinders of Assur-bani-pal Sennacherib and Esarhaddon, and many fragments of tablets already in the collection of the British Museum. We look forward with interest to Mr. Smith's detailed report, as he has been through the length and breadth of the land, and examined many mounds and sites for the first time.

We have just received from Dr. Bleek his Report of Researches into the Bushman Language presented to the House of Assembly of the Cape

Colony. The comparatively scanty materials for studying the language were largely increased by the presence of two Bushmen, who have been with Dr. Bleek for two years and a half, and if possible will remain for at least a year and a half longer. He has taken down from their lips more than 4000 columns (half pages quarto) of text, besides a dozen genealogical tables, and other genealogical, geographical, and astrological notices. The main importance of this Bushman as well as of the Hottentot literature consists in the myths, in which animals, and heavenly bodies are personified. The so-called Bantu nations (Kafirs, Betsuana, Damara, &c.) have legends, but, strictly speaking, no mythologies. The Bushman language has lost, if it ever possessed, those signs of gender which are so clearly marked in Hottentot. It is also distinguished from the latter by the irregularity of the forms of the plural, of which at least fifty or sixty are in existence. On the other hand, there are many similarities of structure (*e.g.* the vocative; the exclusive form of the prefixed pronoun of the 1st pers. plural, *i.e.* that which excludes the person addressed; the relative form of the verb; the reduplication of the stem, so as to give the verb a causative or transitive meaning, &c.). There are also a good many words which seem to be of common origin. But as the principle of the correspondence of sounds has not yet been ascertained, no comparison can be at present instituted on a scientific basis.

The *Centralblatt* for July 12 contains a warm testimony from one of the highest authorities ("Fl.") to the linguistic merits of M. Vambéry's *Uigurische Sprachmomente*. The same journal not long ago contained a slightly too severe examination of the same author's *Geschichte Bokhara's* by a scarcely less eminent historical critic ("A. v. G.").

At their meeting of July 18 the "Académie des Inscriptions et Belles-Lettres" awarded the ordinary prize for 1873 (value 2,000 fr.) to M. Abel Bergaigne, tutor of Sanskrit at the "École pratique des Hautes Études." The subject of the competition was a comparative study of construction in the Indo-European languages.

### Contents of the Journals.

The *China Review*, edited by N. B. Dennys. Vol. I. No. 2. Sept. and Nov., 1872.—The Emigration Convention of 1866. [Code of regulations agreed to by Sir Rutherford Alcock and Prince Kung on the rights and duties of Chinese emigrants.]—The Adventures of a Chinese Giant. [Translation from the Chinese, by H. S., continued.]—The Manchu Conquest of Canton; by E. C. Bowra. [The conquest of China by the Manchus, the present dominant race, dates from 1644. There have been eight sovereigns since, including the reigning monarch. Canton does not seem to have been invaded until 1647 and wrested from the Mings till some years later. The account here given is drawn from Chinese and European sources.]—Rhymes from the Chinese; by A. Lister. [Fourteen poems from a Chinese novel *Yü Chiao Li*.]—From Gotham to Cathay, viâ the Great West [continued].—M. Julien's *Syntaxe de la Langue Chinoise*; by A. Falconer. [Highly favourable review. "The deep scholarship it displays is remarkable, and the ease and originality with which the knotty problems of Chinese grammar are handled are perfectly astonishing, when we remember that M. Julien has never had the advantage of residing among the people." &c.]—Roman and Chinese Coinage; by S. W. Bushell. [Stone moulds, as used for early Roman copper coins, have been employed by the Chinese from the introduction of bronze coins to the present time. The typical circular coins were first circulated at the beginning of the Chou dynasty in the twelfth century B.C. The emperor Ching Wang (B.C. 543-518) increased the size and weight of the coinage: one of the existing moulds is referred to his time; whilst there are many extant of the Han dynasty (B.C. 202-A.D. 221).]—Mr. Wade on China. [Translated from an unpublished State paper, by H. E. Wodehouse; concluded.]—The Port of Hai-K'ou; by F. Hirth. [Account of the trade of that port, in the island of Hainan, which is expected to be opened shortly. The chief imports are opium, Shanghai cotton, hemp, shirtings, and tobacco; whilst sugar and oil are the two principal exports.]—The National Monuments at Yai-shan; by E. C. Bowra. [At this place, on the Canton river, the adherents of the Sung prince made a last stand against the advancing Mongols, in 1278, but were defeated and exterminated. The paper gives an account of the place and the temples erected on the spot.]—Short Notices of New Publications and Literary Intelligence.—Notes and Queries.

No. 3. November and December, 1872.—The Emigration Convention of 1866 [concluded].—The Adventures of a Chinese Giant [continued].—The Symbols of the Yih-king; by Rev. Canon McClatchie. [The writer tries to connect the ancient nature worship and demonolatri of the Chinese with those of the Western nations. He fancies that when the three tribes of Shem, Ham, and Japhet separated they brought away copies of ancient records from which the various sacred books of the heathen world were afterwards compiled (!).]—The Colony of Hongkong; by Jas. Legge. [From a lecture "On Reminiscences of a Long Residence in the East." An interesting description of Hongkong.]

—Chinese Medicine; by J. G. Kerr. [Account of the Chinese notions of anatomy, physiology, and chemistry. Their analysis of the human system is shown to be fanciful. The fact of the circulation of the blood seems to have been known to them in ancient times; air and blood are supposed to permeate the body, but in tubes which have only an imaginary existence.]—Chinese Philology; by J. Edkins. [The writer warns against the tendency of "modernizing," or lowering the antiquity of Chinese history. He defends his principles of Chinese comparative philology and insists on the historical and dialectic changes of the sounds of the language.]—From Gotham to Cathay [continued].—Notes on Chinese Mahometan Literature; by T. Watters. [According to Chinese authorities the first Arabians went to China in the seventh century of our era. Under the Mongol dynasty large numbers of Mahometans were already settled in various parts of China. They have never been prosecuted in the way in which Buddhists and Christians were. An account of their literature is to follow.]—The Song of the Cloud Table on Mount Hwa; by J. Chalmers. [English and Chinese.]—Short Notices of New Books.—Notes and Queries.

No. 4. January and February, 1873.—Taoism, by J. Chalmers. [After a brief comparison of the three forms of doctrine in China, Confucianism, Taoism, and Buddhism, the writer proceeds to analyze the tenets and speculations of Lau-tsze, the originator of the system of Tao, and a contemporary, it is believed, of Confucius.]—The Adventures of a Chinese Giant [concluded].—The Manchu Conquest of Canton [concluded].—Chinese Almanacs; by A. Lister. [Account of two Chinese almanacs, with suggestions to keep up a continual comparative Anglo-Chinese calendar, as those for 1776-1876 published by Mr. P. Loureiro, and 1860-70 by Mr. W. F. Meyers.]—The Small Knife Rebels; by G. Hughes. [Account of a rebellion of a politico-religious society, called the Dagger Society, against the Mandarins and soldiery of Amoy, in 1853. The rebels occupied the city for rather more than four months.]—Chinese Verse; by C. T. Gardner. [Translations of various bits of poetry.]—The Manufacture of Canton Matting; by F. Hirth. [This texture is made from reeds, said to be the *arundo mitis*, but probably of several species. Their natural colour is greenish white, but becomes white in use without being bleached. To produce different patterns, they are dyed.]—From Gotham to Cathay [concluded].—Confucianism; by E. J. Eitel. [Favourable review of E. Faber's *Lehrbegriff des Confucius*, Hongkong, 1872.]—Topography of the Department of Chiung Chou Fu, or the Island of Hainan; by F. Hirth.—Notices of New Books.—Notes and Queries.

## General Literature.

*Songs of the Sunlands.* By Joaquin Miller. Longmans. 1873.

RATHER more than two years ago Mr. Joaquin Miller surprised and delighted the world with a volume of poems which were both new in subject and fresh in style. His descriptions of the sun-bathed scenery of Mexico and California, the bold poetic myths which proved his sympathy with nature in her sublimity, and his pictures of life and passion far removed from the experience of the Old World, were so attractive that it was impossible not to feel that a new poet rich in youthful genius had appeared. Though the warmest admirers of *Songs of the Sierras* might confess that Mr. Miller was deficient in dramatic force and not free from imitations of Byron and more recent lyrist, yet even his severest critics could not deny that he possessed the faculty of imaginative description, vigour of language, melody of rhythm, and what is called originality—the power to apprehend and utter after a fashion of his own. These were no insignificant qualities in a poet who had besides at his command the wild tales and the gorgeous landscape of Southern America. Nor was there any reason to doubt that Mr. Miller's defects might be corrected and his true excellence as a lyrist and *raconteur* be strengthened by growth and study. Yet it must now at the outset be admitted that in the volume before us his old gifts, though still remarkable, have rather run to seed, while his faults of imitation and incompleteness have been confirmed. It is a pity for example that a poet who claims to have chosen only the primeval forces of nature for his masters (see pp. 51, 53) in silence and in song, should have adopted the exquisitely artificial rhythms which Mr. Swinburne has made his own, without at the same time taking the trouble to acquire Mr. Swinburne's art. Disregard of rhyme and metre and language may do well enough in the style of a poet who echoes the fitful Æolian music of the pine-woods of Yosemite; but we cannot welcome *Cyprus and spices, Judah and beauty, other and heather*, in stanzas of which this is a specimen :

"In the place where the grizzly reposes,  
Under peaks where a right is a wrong,  
I have memories richer than roses,  
Sweet echoes more sweet than a song."

It is not difficult to write nonsense verses in this metre. Any literary man can turn out scores of stanzas like the following, which indeed are far from being Mr. Miller's, but are introduced here for the sake of showing how dangerous it is to trust to mere sound :

"O rend for the seasons are rending,  
And bend for the billows are bent,  
Send songs for the torrents are sending  
A song to thy spirit unshent."

Or :

"Go forth to the furrow and sow it  
With seed in the spring-time of truth,  
Spread the rich golden grain for the poet  
To garner ere winter with ruth."

Sometimes Mr. Miller quite breaks down in the mere mechanism of his verses. He writes for instance :

"Has put forth in the frosts, and far regions  
Of snows in the North, and South sands,  
Where never the tramp of his legions  
Was heard, or has reach'd forth his red hands."

Sometimes he makes use of words from which his modern master would turn with a shudder, and which imperiously demand the remedy prescribed for Marston by Jonson in the *Poetaster*: his worst sins in this respect are *resurrected* (p. 235) and *azaline* (p. 227). We feel that Mr. Miller's admiration for poets so exquisite in their use of metre and language as Swinburne and Rossetti are, ought to have taught him more precision, and that he has not enough native force or fire to make bad rhymes and lines endurable, as they may be perhaps in Blake, or to give currency to grammatical innovations. One whole section of this volume, "Fallen Leaves," is very correctly described by Mr. Miller in an introductory quatrain :

"Some fugitive lines that allure us no more,  
Some fragments that fell to the sea out of time;  
Unfinished and guiltless of thought as of rhyme,  
Thrown now on the world like waifs on the shore."

Would it not have been better, we cannot avoid asking, to have followed Mr. Rossetti in that wise caution which made him refrain from throwing on the world anything but what he believed to be mature?

It is no pleasure thus to criticize a poet who can write so vigorously as Mr. Miller does in his prelude to the "Isles of the Amazons," who is able to invent new measures of

his own, and who can produce such Spenserian stanzas as the following :

"They stand a line of lifted snowy isles  
High held above a tossed and tumbled sea—  
A sea of wood in wild unmeasured miles :  
White pyramids of God where man is free ;  
White monuments of God that yet shall be  
The mounts of matchless and immortal song . . . . .  
I look far down the hollow days ; I see  
The bearded prophets simple-souled and strong,  
That strike the sounding harp and thrill the heeding throng."

The poem, "By the Sun-down Seas," from which this stanza is taken, is distinguished by full-breathed and resonant versification. In its matter it is a mixture of Californian descriptions, recollections of London, and Byron-worship, held together only, if at all, by the fervid feeling of the poet, and dedicated to the thought of death. "From Sea to Sea," the next poem in the book, has more of obvious unity. Here Mr. Miller describes a journey by the Pacific Railway from the Atlantic to the shores of San Francisco. There is perhaps too much of strain and effort after picturesque effect in the successive scenes which are presented to the reader, as "the matchless steed of the strong New World" bears him beneath the poet's guidance from west to east across a continent. But the conclusion is both highly imaginative and musical :

"We have lived an age in a half-moon wane !  
We have seen a world ! We have chased the sun  
From sea to sea ; but the task is done.  
We here descend to the great white main—  
To the King of Seas, with the temples bare  
And a tropic breath on the brow and hair.

We are hushed with wonder, and all apart  
We stand in silence till the heaving heart  
Fills full of heaven, and then the knees  
Go down in worship on the golden sands ;  
With faces seaward, and with folded hands  
We gaze on the beautiful Balboa seas."

The mixture of iambic and anapæstic rhythms which may be noticed in this quotation is characteristic of the whole poem. By far the longest piece in the book is called "The Isles of the Amazons." A story is told of a young knight who during the Spanish conquest of Southern America is supposed to have grown tired of bloodshed and battle and to have roamed away to the shores of the Amazon River. There he lived as a woman among warrior women who had abjured love, but whom he weaned to softer emotions by the melodies of his singing :

"They turned from the training, to heed in throng  
To the old, old tale ; and they trained no more,  
As he sang of love ; and some on the shore,  
And full in the sound of the eloquent song,  
With a womanly air and irresolute will  
Went listlessly onward as gathering shells,  
Then gazed in the waters, mirrored themselves,  
Put back their hair and sighed, and were still.  
And they said no word. Some tapped on the sand  
With the sandalled foot, keeping time to the sound,  
In a sort of dream ; some timed with the hand,  
And one held eyes full of tears to the ground,  
As the tide of years turned stormy and strong,  
With its freightage of wrecks and impossible things,  
And a flood of far memories, born of the song,  
And borne to the heart on articulate wings."

The strange half-consciousness of womanly life awakened in the Amazons by the minstrel's music, and the gradual yielding of their queen to love, are described in a wonderful dream-melody of verse which suits Mr. Miller's style. But the thread of the romance is too thin to be spun out as he has spun it through more than a hundred pages, with preludes and introductions to each of its five parts. "In the

Indian Summer" has much of that rich and lustrous beauty which was so charming in the *Songs of the Sierras* ; but as a poem it is incomplete. Mr. Miller has not grown in the faculty of developing his theme with vigour and distinctness. A blinding tropical haze, through which we can scarcely distinguish figures or objects, seems to hang over his compositions of this sort. "Olive Leaves," another section of the book, appear to be reminiscences of a tour in Palestine. One or two of these pieces reveal the most amiable of Mr. Miller's characteristics—his sympathy with women in their tenderness and goodness, and his sense of the pathos of children : but the whole collection is even below Byron's *Hebrew Melodies* in adequacy to the subjects chosen for treatment. By far the most beautiful poem in this section is the prelude ; indeed it may be said in passing that Mr. Miller is singularly felicitous in the short introductions which he sets before his studied works of art. I quote the whole of this dedication for its simple beauty and touching truth of feeling :

"O boy at peace upon the Delaware !  
O brother mine, that fell in battle front  
Of life, so braver, nobler far than I,  
The wanderer who vexed all gentleness,  
Receive this song ; I have but this to give.  
I may not rear the rich man's ghostly stone ;  
But you, through all my follies loving still  
And trusting me . . . nay, I shall not forget.  
A failing hand in mine, and fading eyes  
That looked in mine as from another land,  
You said : some gentler things ; a song for Peace.  
'Mid all your songs for men one song for God.'  
And then the dark-browed mother, Death, bent down  
Her face to yours, and you were born to Him."

Here, as in many other parts of this book, the personality of the poet emerges in a way to win our sympathy. Mr. Miller has the faculty of making himself felt through what he writes, and we quit his poems with a mingled sense of admiration and regret—admiration of his really great powers, regret that he seems unable to pursue one of two courses in their application, either to strike out a style for himself as original as his own theory of art (pp. 51-54) or else to acquire the principles developed by his masters, by Byron in the treatment of a subject, by Swinburne in versification.

J. A. SYMONDS.

W. Goethe. *Les Oeuvres expliquées par la Vie*. By A. Mézières.  
Paris : Didier. 1873.

THE second part of M. Mézières' work begins with the period when the relations between Goethe and Schiller assumed, almost suddenly, the character of intimate friendship which they never afterwards lost ; and includes discussions of *Wilhelm Meister*, *The Elective Affinities*, *Faust*, and a few of the poems belonging to this later period. The volume has, perhaps, less freshness than its predecessor, for while M. Mézières' concern is avowedly only with Goethe's works as explained by his life, the works just enumerated are those which throw more light upon the story of his life than they derive from it. The author is evidently less at home in paraphrasing or commenting upon the *Bride of Corinth* and *Faust* than in reconstructing the features of Aennchen or Lili and in distinguishing the proportion of truth mixed with the idealized exaggerations of *Werther* ; and as it is when he ceases to derive much assistance from the poet's biographers that his criticism becomes most nearly commonplace and insignificant, it is impossible not to suspect that second-hand materials have been too much relied upon throughout ; the author, for instance, is better acquainted with M. St. René Taillandier's *Studies on the Correspondence between Goethe and Schiller* than with

the correspondence itself; and with M. Caro on the Philosophy of Goethe than with the scattered passages in his works which confirm or modify M. Caro's views. He has too much tact to be often wrong, but he seems scarcely aware how very obvious an opinion he is repeating when he observes that the general idea to be gathered from the *Elative Affinities*, *Wilhelm Meisters Wanderjahre*, and *Pandora* is "la nécessité de la privation." He is rather more original in estimating the effect exercised upon his writings by the state of moral isolation in which Goethe's conscientious adherence to this principle tended to place him before and after his friendship with Schiller. The dread of giving hostages to fortune, or contracting any material engagements, which might have the right or power of restraining the inner impulses of self-development or production, fixed the limit either of the duration or the expansiveness of most of Goethe's attachments. Schiller was the only one of his contemporaries with whom he could exchange ideas on something approaching to a footing of equality, without being called upon in any way to alter the normal course of his life, or to pledge himself to any sentiments that did not arise naturally out of a close interchange of mental good offices. The friendship which had so excellent an effect in stimulating the productive energies of both poets was originally and chiefly a friendship between the poets rather than between the men. M. Mézières doubts whether, except in the prison scene in *Faust*, Goethe ever displays the highest dramatic power, and it is intelligible why he should always fail to do so in cases where the hero is the mouthpiece of his own anxiety not to allow another life to become too closely and influentially bound up with his own, for it is by the conflicting action of such intimate moral ties that most tragic effects are produced. He dwells at some length upon the contrast between Schiller's aspirations after realizing the Ideal and Goethe's bent towards idealizing the Real, and he sees in the fortunes of the Weimar theatre, as well as in Wilhelm's experiences as an actor, proof of the insufficiency of merely æsthetic standards to direct or satisfy a miscellaneous public. He is careful not to exaggerate what seemed the anti-popular, unpatriotic aspects of Goethe's political attitude, and traces it to his consistent conviction that it was impossible to act with effect upon masses, that individuals alone are perfectible, and that as each individual has to work out his own perfection, the greatest man has no higher duty to his neighbour than to lead his own life as perfectly as possible, giving thereby an example to his contemporaries, and in the case of an artist, also works of permanent advantage for the æsthetic education of the race. Of the *Bekennnisse einer schönen Seele* he remarks that Goethe's sympathies were excited by the doctrine which gave his heroine the same mental calm and the same strength for renunciation as were the objects of his own endeavour, while his admiration was scarcely on the whole diminished by the circumstance that he believed her own faith and imagination to be the only supernatural powers from which she derived aid and inspiration; her own opposite conviction being a mere illusion and the one point on which her wisdom was less realistic than his. Perhaps the printer is answerable for the fact that Fräulein v. Klettenberg's name is seldom spelt twice alike. M. Mézières criticises with some justice the reception which Madame de Stael met with from the two great lights of the Weimar Court. It is easy to believe that her voluble conversation gave promise of all the misconceptions perpetuated in her book, but even where she was least able to understand, a generous desire to do justice *à tort et à travers* is so obvious that one cannot but wish her foibles had been tolerated with good-

humoured superiority instead of exciting as much consternation as an invasion in force by the French army. It would have been impossible to find a point of vantage for Madame de Stael over either Napoleon or Goethe, if both had not failed in courage when the time came to encounter what was not after all a very formidable wit. Schiller spoke French with difficulty, but Goethe had no reason to shun the encounter, for he convinced the visitor that he had an "esprit prodigieux en conversation . . . s'il était Français, on le ferait parler du matin au soir." No doubt the prospect was not seductive, but if he had turned his very just and acute criticism of Madame de Stael's conversation "comme femme et comme Française" into an epigram, he would probably have found her able to appreciate it. The epigrammatic form is all that M. Mézières thinks wanting to excuse the introduction of the many valuable sayings copied from his note-books to swell the bulk of the last part of *Wilhelm Meister*. The commentary on *Faust* is the weakest point in the work, and ends with the not very intelligent complaint that Faust feels and expresses no remorse either for the sins of his age or youth. It is at least as obvious that the theory of sin has no place in Goethe's philosophy as that the theory of renunciation has a conspicuous one. On the whole M. Mézières' book is more likely to be serviceable to his countrymen as an introduction to, than as a substitute for the study of the poet's own works.

EDITH SIMCOX.

#### LITERARY NOTES.

In the *Revue des deux Mondes* (Aug. 1) M. Rambaud has an article on the legend of Peter the Great in the popular songs and tales of Russia, which is full enough to be interesting, though very far from exhaustive; he touches on the question what guides the popular muse in celebrating and the popular memory in retaining one characteristic incident or trait rather than another, but he does not attempt to fix the comparative age of the different songs preserved by tradition, the only way in which the history of the legend could be made to throw fresh light upon the growth of the *chansons de geste* of Charlemagne, with which he compares it. One of the best of the songs tells how the Tsar wrestled with a dragon, who craved as a reward for not abusing his victory "to be allowed to drink brandy without payment in all the taverns of the crown," a conclusion which the memory of Goethe's *Sänger* warns us not lightly to condemn as prosaic. In the same number some *Stances Satiriques* by Henri Blaze de Bury are noticeable not so much for novelty of conception (for the immorality of well-born women is an old theme with satirists), as for the fluent energy and *entrain* of the verse, especially on the last page.

Mr. Herbert Spencer's paper in the current number of the *Contemporary* is mostly occupied with a restatement of the dangers that may be expected to follow from sentimental or humanitarian interference with the principle of natural selection, while an article by Mr. George Darwin in the same review seems to advocate legislation *in aid* of that principle. The same line having recently been taken by Mr. Greg and Mr. Galton, it is perhaps time to ask whether the doctrine of evolution does not offer a way of escape from the supposed necessity of "that natural process of elimination by which society continuously purifies itself." To kill off the weaker members of a community does not add positively to the strength of the survivors, while it might be maintained that, as all powers grow by exercise, the strong who undertake the protection of the weak will become in the progress of evolution, stronger than if they had no weak to protect; while on the other hand, the naturally weak may, if the conditions of life can be made sufficiently favourable to them, develop powers that after a few generations will seem to have been worth transmitting. At any rate the survivors in the natural struggle for existence will not become increasingly "fit" for the task of improving the specific type by learning to rely

upon a quasi-mechanical process—only perfectly natural while it is unconscious—which can but testify, at the best, to their comparative, and not to their positive approximation to specific excellence.

The *Fortnightly* has an interesting article on Poliziano by Mr. J. A. Symonds; the translations from his Italian poems are so good that those who are so inclined may conclude from them, without injustice to the originals, that the reviewer's estimate of his author errs, if at all, on the side of partiality.

*Unsere Zeit* for July and Aug. 1 has a very interesting and *gründlich* account of the discovery, importation, and cultivation of the chincona tree. The "Marginal notes on Goethe's Works" by different writers given from time to time in *Im Neuen Reich* are worth the attention of zealous students of his works, or the still more voluminous mass of miscellaneous Goethe literature.

We have received *The Last Knight* (Hurd and Houghton), translated by T. O. Sargent from the German of Anastasius Grün (Count Auersperg). It is a quasi epic in a cycle of ballads, fluent, spirited, and if generally obvious, seldom false or vulgar, on the adventurous career of Maximilian of Austria. The translation is worthy of the original.

A new work of Victor Hugo's is promised for the spring: the subject is taken from the history of the Revolution, and the title, according to the *Athenaeum*, will be *Quatre vingt treize. Premier récit; la guerre civile.*

We have reason to believe that Mr. Thorold Rogers is the author of the lively and spirited imitations of Horace now appearing in *Temple Bar* under the signature of Edwin Heron.

A letter from Dr. Schliemann in the *Allgemeine Zeitung* (Aug. 5) describes the discovery in the course of his excavations of a treasure which, whether that of Priam, as he of course hastens to conclude, or not, appears to be of great value and interest; he mentions shields and vessels of different sizes made of wrought, unalloyed copper, silver vases, a flask and cups of pure gold, ornamented gold fillets and pendants, bracelets, and a large number of gold earrings, buttons, and other trifles. The silver and copper vessels are in some cases joined together as if welded by fusion—when Troy was burnt.

## Art and Archaeology.

Sacchi's Pictorial Notices of Cremona. [*Notizie Pittoriche Cremonesi*, raccolte da Federico Sacchi.] 8vo. Cremona. 1872.

THIS work is alphabetical, and divided into four parts, of which the two first are by Mr. Sacchi, while the two last are extracts from the accounts of the Cremona cathedral printed from an old MS., and documents from the Cremonese archives put together by Mr. Ippolito Cereda. In the course of their labours the compilers publish at length much that has been published before, as an instance of which the notes on Girolamo da Cremona may be cited, which are extracted to the extent of fifteen pages from the last edition of Vasari. What they add to our stock of knowledge is perhaps less than we should expect from a large octavo of 360 sides.

The first concrete fact at which we arrive in the space of thirty opening pages is that Sofonisba Anguissola died in 1626, and not, as historians usually assume, in 1620. Much patience and research are displayed by Mr. Sacchi in establishing this fact; yet we may ask whether the result was worth the cost in time, in labour, and in print. Further on, we find our knowledge increased by small and not uninteresting contributions to the history of the lives of the Bembo's, Boccaccinos, and Campis; and an entire chapter giving intelligence of Marco Marziale, who, though not a Cremonese,

painted much for Cremonese churches. The only fault we have to find with this portion of Mr. Sacchi's book is its want of condensation. Descriptions of pictures, lives, and annotations succeed each other without producing that clearness in the reader's mind which they ought to create; and the confusion is not removed by the casual introduction of appendices containing matter previously unnoticed, and thrust in at last because it was discovered too late to be introduced before.

Amongst the documents of Mr. Cereda which are curiously described in a title-page as hitherto "unedited" we find the contract of Pordenone for the frescoes of the Cremona cathedral, printed as long since as 1823 by Count Maniago; others relative to Bembo and the wall paintings of the *castello* of Pavia, which appear at full length in Rosmini's History of Milan published in 1820. But besides these we have, it may be owned, new documents of interest, such as Boccaccino's will proving this artist's existence to have extended beyond the year 1524, contracts illustrating the life of Camillo Boccaccino, contracts proving that Soiaro was born at Cremona, and statutes showing the organization of the painters' guild at Cremona in 1470.

To the Cremonese this book will probably be welcome, as it gives them an account in their own language of many pictures which have been removed by speculators from their churches and public edifices. It will be further welcome as extending their acquaintance with men of whom Cremona may still be proud. As a book of reference also these *Notices* will have their use. But they do not and never will fill the place of a standard work. J. A. CROWE.

## LA COMMISSION DE LA TOPOGRAPHIE DES GAULES.

WHEN the *Academy* noticed the death of the ex-Emperor Napoleon III. "as an author," no mention was made of scientific institutions which have their origin in the archaeological fancies of the historian of Julius Cæsar, viz. the Commission for the Topography of Gaul and the Celtic Museum at St. Germain-en-Laye. Both have fortunately survived the Empire, and they deserve to be made known to British scholars. Let us here say a few words of the former.

The "Commission de la Topographie des Gaules" was established in July, 1858, for the study of national geography, history, and archæology up to Charlemagne's times. It was composed as follows: MM. de Saulcy (président), Amédée Thierry, Guignault, de Wailly, Alfred Maury, Colonel Blondel, Lieutenant-Colonel de Coynart, Chéruef, Alex. Bertrand, Alf. Jacobs. In later years MM. Viollet-Leduc, Général Creuly, Léon Renier, Anatole de Barthélemy and Lartet, all historians or antiquarians of note, were added to the original members of the Commission.

It is to this Commission that we are indebted for the prosecution of the excavations at Alise-Sainte-Reine, the light thrown upon the vexed Alesia question, and the important discoveries made at that place, not to mention many other researches and excavations which have already been made or are still in progress throughout France. But one result generally follows when sovereigns aspire to take an active part in scientific undertakings: and people anxious to cover personal ambition under the show of zeal for archæology turned into would-be antiquarians to attract the favourable attention of an antiquarian Emperor.

Beside those recorded in history, there are many places in France to which, rightly or wrongly, the name of Cæsar remains attached—Cæsar's Camp, Cæsar's Ditch, &c. The antiquarians were equal to the occasion and poured forth essays and controversial papers with great fertility, to determine the traces of Julius Cæsar. Local rivalry was soon imported into the matter. Cities or villages (what a patriotism for the descendants of the old Gauls!) contended for the honour of having been burned down by the Cæsar of old. The modern Cæsar, who was not without a certain kindness

in these matters—and who did not like contradiction—was soon won and finally led by those who invariably found he was in the right.

The "Commission de la Topographie des Gaules" had their own opinion on some archaeological points. They would not place Genabum at Gien, Uxellodunum at Puy-d'Issolud, &c. The Emperor, by little and little, set them aside, and in the last years of his reign he altogether ceased to consult them: some members of the Commission silently retired. The Commission nevertheless continued their work, and still gave a vigorous impulse to Celtic and Gallo-Roman studies. All the antiquarian societies of the provinces and the chief French scholars now correspond with them: important excavations are being made at many points under their direction, and the museum at St. Germain owes to them a large portion of its rich collections.

The excavations at Alise, those at Mont-Beuvray, the controversy about Gaulish wall-building, the determination of the ancient highways are their principal achievements. One may confidently say that with modest resources the Commission have greatly extended the conquests of Gaulish archaeology, and that it is now one of the most important centres of research in the wide field of Celtic antiquities.

Up to the present time the Commission have published:

1. An oro-hydrographical map of Gaul in four sheets. This is a splendid *carte muette*, which has been recommended by the Ministry of War for military schools and for strategic studies, and from which reductions are now being made for public schools by order of the Ministry of Public Instruction.
2. A map of Cæsar's campaigns, now out of print.
3. A map of Gaul under the proconsulate of Julius Cæsar in four sheets, identical with the oro-hydrographical map already mentioned, with the addition of the nomenclature and colours for boundaries, &c.
4. Three parts of a *Dictionnaire Archéologique de la Gaule, époque celtique*, viz. forty-two 4to sheets and forty engraved folio plates.

The text goes as far as the letter D. It contains under their ancient form the names of places mentioned by the ancients, and gives the text of references epigraphical as well as historical; most of them have been identified with modern places, and the Commission give their arguments for each name. It gives next, but under their present form, the names of places where megalithic monuments (circles of stones, standing-stones, &c.) are still on view, and the names of those where antiquities of any kind (stone or metal implements, arms, coins, &c.) have been discovered. It is in fact a *résumé* of the archaeological history of each locality. Some of the articles are extensive and interesting monographs; e.g. those on Abbeville and Saint-Acheul, places well known by the implements found in their alluvial beds, and that on Alise-Sainte-Reine, which, in our opinion, is satisfactorily proved to be the celebrated Alesia of old. In the first part, the Commission had ventured to give etymologies of names of places which were in more than one instance objectionable: in the second part, they have left etymologizing aside and have wisely confined themselves to archaeological ground. Their business is to produce *facts* which others may work into history or philology, not *opinions*; and etymologies are opinions, however certain they may appear.

The plates of these parts are beautifully got up; they represent stone implements found at St. Acheul, Abbeville, and the Périgord caverns, views of the Gavr Inis tumulus, and of its strangely-decorated walls, the Gaulish coins, *facsimiles* of the Gaulish inscriptions found in France, Gaulish arms and ornaments, &c. It is indeed nothing less than an illustrated encyclopædia of Gaulish life.

5. A map of Gaul indicating the site of dolmens and megalithic monuments.
6. A map of Gaul indicating caverns which have been inhabited in prehistoric times.
7. A preliminary map of Gaul in the fifth century A.C., issued for private circulation, to be communicated to local scholars and antiquarians who correspond with the Commission, and to call forth their observations on the highways, &c.
8. Four sheets of instructions (with plates) for the assistance of correspondents of the Commission in classifying arms, coins, and jewels, and in interpreting ancient itineraries.

Moreover the Commission are preparing a map of Gaul showing the geographical distribution of the Gaulish tribes; and when they have finished the Dictionary of Celtic Archaeology, which is destined to be a complete repertory of the antiquities of Independent Gaul, they will begin a Dictionary of Gallo-Roman Archaeology on the same plan, to comprise the long period extending from the reign of Augustus to the Frankish kings.\*

H. GAIDOZ.

#### NOTES ON ART.

The new Belgian journal *La Fédération Artistique* offers temptation to subscribers in the shape of prizes consisting of large photographs, worth five francs each, taken from the works of modern Belgian artists. Two subscriptions give a right to one of these prizes (*primes extraordinaires*), and subscribers are allowed to choose from a series of twenty-five photographs. Besides these *primes extraordinaires*, three gratuitous prizes representing the amount of the subscription in their value will be given annually to all subscribers.

The present list of prizes comprises: Plage de Scheveninghe and L'enfant malade, by Bource; Partie de Campagne and L'enfant trouvé, by Boks; Indiscrétion and D'Anvers à Tamise, by Cap; Carnaval, by Franck; Trop précoce, by Heyermans; Hiver and Vue prise à Zwyndrecht, by Lamorinière; Céramique, by Lagye; Taverne hollandaise au XVII<sup>e</sup> siècle, by Moermans; La vendeuse de statuettes, by Ooms; Pécheurs à la ligne, by Quitton; Famille italienne, by Swerts; Les cadeaux de noces, by Van der Ouderaa; Intérieur d'écurie, by Van Kuyck; La petite tricoteuse and Un froid de chien, by Verlat; Promenade, La Place de Meir au XVIII<sup>e</sup> siècle, and Par droit de conquête, by Vinck; Partie d'échecs, by Webb; Clair de lune and Cascade, by Wust.

In the first instance two photographs from Alma Tadema, "L'amateur de tableaux" and "L'amateur de sculptures," were included in this list, but the choice of subscribers falling chiefly on these the copies have been exhausted and the two pictures by Charles Verlat substituted for them.

The Royal Academy of Belgium has recently bestowed its quinquennial prize for literature on M. Edouard Fétis in consideration of his writings on the Fine Arts. M. Fétis is chiefly known by his contributions to *L'Indépendance belge*, but his learned work on *Les Artistes Belges à l'Etranger*, reprinted in 1857 from the *Bulletins de l'Académie Royale de Belgique*, introduced him to most students of art. His latest work, *L'Art dans la Société et dans l'Etat*, which appeared in 1870, has met with less attention in England than ought to have been accorded to it. Belgian writers are indeed too often overlooked by our critics.

The *Gazette des Beaux-Arts* for August contains: 1. An article by M. Sully Prudhomme on "Quelques œuvres décoratives inédites." These modern decorative works adorn the house of M. Paul Sédille, a French architect, and are chiefly symbolical representations in sculpture and painting of various abstractions, such as Nature, Poetry, Music, Architecture, &c. M. Prudhomme is so enchanted with the dignity and beauty of these representations that he cannot restrain himself to prose in describing them, but breaks out into enthusiastic verse. Speaking of two caryatides of Nature and Tradition executed by M. Chapu which are to be seen in the vestibule of the mansion, he tells us "en cherchant à les décrire je sens l'harmonie de leurs lignes rythmer sournoisement ma phrase, et comme, au demeurant, la poésie ne saurait être pire en vers qu'en prose, je m'abandonne sincèrement au lyrisme et je rime un sonnet en leur honneur." Fancy an English or German critic allowing the harmony of a work of art "rythmer sournoisement sa phrase" or abandoning himself sincerely to lyricism! The quality of M. Prudhomme's verses, we feel obliged to state, offers no excuse for this abandonment.—2. The pictures of the German schools of painting in the Belvedere Gallery at Vienna are criticised by M. Clément de Ris in a notice

\* The publications of the Commission which are not out of print, or intended for private circulation, may be had at the "Librairie Militaire de Dumaine" in Paris.

continued from a previous number. M. de Ris considers that the works at Vienna by Albrecht Dürer are far superior to those at Munich, an opinion in which we cannot agree, remembering that Dürer's grand paintings of the Apostles, universally acknowledged to be the masterworks of his art, are in the Munich Gallery.—In article 3, M. Dumont gives us a learned disquisition on the "Vases peints de la Grèce propre" as distinguished from those found in Italy of Greek origin which are far better known. The article is to be continued, and is illustrated by several interesting outline drawings of classic subjects.—4 is devoted to an *In Memoriam* review of the late Louis Vitet, one of the best art writers and critics of France.—5 is entitled "Causerie sur le Château de Blois" and is by M. Lechevallier-Chevignard. The Causerie is enlivened and rendered more instructive by several woodcut illustrations and by an effective etching by Rochebrune of a picturesque corner of the old château.—6 considers "La Gravure au Salon," which we may suppose concludes the notices of the Salon of 1873. The writer, M. Paul Leroi, suggests to M. Emile Galichon, who is at the head of the Société Française de Gravure, a French Exhibition in Black and White such as has already been held in London and New York. It is strange certainly that France, whose engravers and aquafortists are certainly not inferior to those of any nation, should be behindhand in such an exhibition.—7. M. H. Havard continues his "Exposition rétrospective d'Amsterdam."—8. A notice by M. Olivier Merson of the Exposition at Bordeaux.—9. M. Louis Decamps reviews *Le Frans Hals de M.M. C. Vosmaer et W. Unger*, a work to which we have already drawn the attention of the readers of this journal. One of Unger's powerful and characteristic etchings from Hals' picture of "The Banquet of the Officers of the Arquebusiers of St. George in 1827" accompanies the text. The *Gazette* is worth buying this month for this etching alone.—10. A review by M. Louis Desprez of *Les Collectionneurs de l'Antienne France, Notes d'un Amateur, par Edmond Bonnaiffé*.

Dr. Alfred Woltmann in his "Streifzüge in Elsass," continued in the present number of the *Zeitschrift für bildende Kunst*, gives an interesting history of Colmar, its museum and its great fifteenth century master Martin Schongauer, who was the predecessor and in some respects the teacher of Albrecht Dürer. Unfortunately for students Martin Schongauer's paintings are seldom to be met with except in his native town of Colmar, so that it is difficult for those who have not, like Dr. Woltmann, made excursions into Elsass to judge of them, but his beautiful engravings and etchings are less difficult of access, and reveal the mind of the artist more fully perhaps than his larger works in painting. There is a splendid collection of his prints in the British Museum. The *Zeitschrift* gives us two woodcuts from photographs of the wings of an altar-piece in Colmar by Schongauer and a worn-out woodcut from Schnaase's *Geschichte* of the "Madonna im Rosenhaag," Schongauer's most celebrated picture.

The New South-East Court of the South Kensington Museum has now for some time been open to the public, and a short account of the objects it contains has been added to the general guide-book. A detailed descriptive catalogue of the architectural and monumental sculpture has also been prepared by Mr. J. H. Pollen, and is now "under revision." Truly the administration of the South Kensington Museum deserves more gratitude than it is likely to get for its labours in carrying out such works as this. "Il est impossible," as is even owned by a French critic, "de mieux comprendre et de mieux remplir les devoirs d'un musée vis-à-vis du public."

The *Portfolio* for August contains an interesting article by Mr. Simcox on "The Greek face before Phidias," in which it is argued that the remains of archaic Greek art indicate "a transformation of the Greek face corresponding to the transformation which we know took place in the Greek mind."

A good, but not very interesting etching by Legros, a lithograph from Andrea del Sarto's well-known portrait of himself, and two small and charming etchings by the editor, Mr. Hamerton, are the illustrations of the month.

### Philosophy and Science.

- A *Budget of Paradoxes.* By Augustus de Morgan. [Reprinted, with the author's additions, from the *Athenæum*.] London: Longmans. 1872.

It is an opinion current among librarians, that there is no such thing as trash: that the most foolish unconnected flysheet treating of nothing at all should in all cases be preserved and bound up with other such flysheets, not in view of any possible future investigator to whom it may be as gold among quartz, but because it is right that this thing should be done. No doubt a very great good comes of this absolute universalism in the conscience of all kinds of collectors. But still, for the purposes of the outer world, it remains true that there are books and books. It is obvious of some kinds of literary or scientific work that if A. B. had not done it, C. D. would have taken his place; and that at no loss to the world, even though C. D. were a person of mean capacities. The bricklayer who was to lay a certain course of bricks may fall off a ladder and yet the house be no worse in the end; while the skilled mason who carves a gargoyle may leave something which represents not merely his day's wages but himself (invaluable) so long as stone shall last, and therein something which no other man could exactly produce. The book before us is essentially a gargoyle. It is by very far the most individual book of the age—individual, not merely in its own singularity as a book, but as presenting with a marked degree of clearness and exactness the personality of one who was never quite a man among men, but always a man among other men.

The paradoxes herein treated of are those set forth by people ignorant of mathematic, who think themselves qualified to show such as are not ignorant where they have gone astray. It might well have been conceived that a large book on such a subject would have been the dullest of the dull: that it would appeal only to mathematical readers, and even to them only for so long a time as the follies exposed in it were of recent interest. No anticipation could be more thoroughly wrong. The fault of the book is in the direction of a too incessant playfulness; it is excellent grotesque, which is only to be borne because it is so clearly an outwork of the beautiful. For while the pretenders here slaughtered are for the most part indeed nobodies, whose only use is for an example and a warning; while the jokes (with some

notable exceptions) are small jokes, and such as we like chiefly in our idiotic moods; while even the character which so clearly shows through these pages, great and lovable as it is, is yet rather singular than pre-eminent, a study for comparative psychology rather than an ideal for the world to come; while all this is true, the book is an endeavour and a stretching forth towards right thinking and a protest against wrong thinking, which is of infinite solemnity and weight to us of this present time. For we have no right to conclude that these paradoxers upon whom the *Budget* has fallen have been sinners above all that prate; we ought rather to learn that except we mend our ways we shall all likewise perish.

The word *paradox* is unfortunate; it includes under one name a rare thing and a common thing, and it brings upon the rare thing which is good some of the discredit that belongs to the common thing which is bad. "A paradox is something which is apart from general opinion, either in subject-matter, method, or conclusion." The "general opinion" must be that of people who have an opinion; not of all people indiscriminately, including those who have never considered the subject. The common form of paradox consists in ignorance of the subject-matter, powerlessness in the method, or incapacity to understand the conclusion. The rare form of paradox is an addition to the reasonable part of general opinion, which happens to contradict some of the unreasonable part. The older use of the word was strictly impartial, and it might be applied without any want of respect; De Morgan says the change came in the seventeenth century. It is certain that at present the epithet is a disparaging one; the overplus of wrong thoughts included under it has slowly sapped the moral constitution of the word, and it now sometimes stands in the way of a right appreciation of the nobler form of paradox.

For as it is hardly possible to lay too great a stress on the weight and worthiness of thought which diverges from the general opinion on account of its greater strength, which by its continual work in the world has in fact built up the present mind of man; so it is before all things necessary here to distinguish carefully from it that other divergence which comes of weakness and goes to destruction. It is true in all departments of human action that reform is the most precious and sacred prerogative of a citizen; but in order to have that prerogative one must be a citizen, not an alien; and one must act like a citizen in a legitimate and constitutional way. A man who should find an error in the value of  $\pi$ —even in the six hundredth place—would have all honour paid him as a true reformer by the brotherhood; but to this two things are necessary: he must not be ignorant of trigonometry, and he must work out the calculation. The belief of the weak paradoxer, on the contrary, is that things can be done by a flash; that a discovery is to start from his ignorant and untrained mind like Pallas from the brain of Zeus. We know, of course, that the great discoveries—the true and noble paradoxes—have always come from men who by long apprenticeship had so far mastered the tools forged by their fathers that they were not tied down to one particular way of using them; we know that Jove's head cannot crack with Minerva unless he have previously swallowed Metis. The time taken by distant discoveries—gravitation, for instance—is foreshortened by perspective; but we have good cases immediately before our eyes. In Maxwell's theory of electricity we have as instructive an example of the paradox of right thinking as might well be; a conclusive victory over rival doctrines won by twenty years' patient proving (and improving) of the weapons wherewith previous battles had been gained; a testimony to all time that genius is a capacity for taking an infinite amount

of the right sort of trouble. But your paradoxer of the *Budget* will master by a *coup d'état* the republic of science, which allows no masters, but proved comrades only; he will climb by the back stairs into the house of knowledge, that has no back stairs. If there be any reward in the penal incurable blindness that follows such sacrilege, verily he has his reward.

And here is another important difference between the two kinds of heretics. The strong heretic is so because his ideas are living and plastic, and have an internal motion whereby they adapt themselves continually to new work; so that no man is so perfectly open to conviction as he is. But the weak heretic is so from the very narrowness of his range, which cannot grasp even established demonstration; he is hermetically sealed against all possible argumentative germs that might bring into his mind the lower forms of life.

In drawing this sharp distinction between two habits of mind, however, we must not forget what the *Budget* is specially calculated to impress upon us in a terrible and alarming manner; the exceedingly gradual transition from one to the other, and the possible co-existence of both in the same person in regard to different subjects. De Morgan has some very good remarks on the value of a study of logic in helping us to extend the habits of right thinking which we have got by practice in one subject over the whole range of our knowledge. A good specialist who is also a good logician can hardly be betrayed into gross paradox out of his proper range; for his special knowledge will make him cautious about facts, and his logic about conclusions. No man could have greater advantages in this respect than the author of the *Budget*, who had himself made important additions to logic, and was an excellent mathematician. And yet—this is the solemn warning of the book—he has in one case fallen into a sin to which we are all tempted, whether by the unpromising precepts of theological systems, or by the insidious seductions of scientific text-books; the sin of making assumptions and then hiding from ourselves that they are assumptions and that we have no right to believe in them. Apropos of "From Matter to Spirit," he says that he refers certain phenomena "*either to unseen intelligence or something which man has never had any conception of.*" This apparently suspended judgment involves and hides the assumption that the said phenomena cannot possibly be referred to certain well-known and commonly conceived things—the art of the conjuror, and the delusion of contagious excitement. This enormous assumption is—of course unconsciously—introduced and hidden under a brilliant display of candid impartiality and cautious scepticism. We point to this, not as throwing a stone thereat; but desiring that it should indicate the great and serious importance of the *Budget of Paradoxes*. To sum up, this is a book that should be read by those who care about circle-squarers and all manner of jokes, mathematical and other; by those who care to make the acquaintance of Augustus de Morgan, which it is well worth while to do; but above all by those who care to be led into right thinking and warned from wrong.

W. K. CLIFFORD.

The Fertilization of Flowers by Insects and their Mutual Adaptation for that Function. [*Die Befruchtung der Blumen durch Insekten und die gegenseitigen Anpassungen Beider. Ein Beitrag zur Erkenntniss des ursächlichen Zusammenhanges in der organischen Natur.* Von Dr. Hermann Müller.] Leipzig: Engelmann.

THE old idea, once a favourite topic with poets and divines, that the beauty of the external world was intended exclusively to promote the enjoyment of mankind, has suffered many severe shocks from the rude onslaughts of modern science. The discovery that the earth was a habitable and

inhabited world countless ages before man appeared upon the scene might be explained on the hypothesis that it was thus becoming prepared for the advent of the masterpiece of creation; the egotism of the human species might even survive the discouraging fact that gems of purest ray serene were born in the unfathomed caves of Silurian or Devonian oceans, and that flowers of the most perfect beauty were born to blush unseen in the midst of oolite or cretaceous deserts. The un pitying theory of the survival of the fittest however points relentlessly to the conclusion that man after all is not the *raison d'être* of anything he sees around him except himself; that "jedes für sich" is the rule of Nature, that every organic being is contrived so as to have the best chance of supplying its own wants, and not for the sake of administering to the wants of others; in fact that the philosophy of science must, for the future, be an application to the realms of Nature of the principle of self-love, such as even a Hobbes might accept.

The volume before us, though full of minute details of empirical observation, is an important contribution to this philosophy of science. The main fact which forms the ground-work of Prof. Müller's observations is not new. Towards the close of the last century one of the keen observers of nature with which that period abounded, C. C. Sprengel, in his *Das entdeckte Geheimniss der Natur im Bau und in der Befruchtung der Blumen*, pointed out that a number of the different forms which the flowers of plants assume are obviously contrived for the purpose of attracting insects and of enabling them to carry away the pollen which is required to fertilize other flowers of the same species. This line of research, which had been almost lost sight of since Sprengel's time, has been renewed in our own day by Darwin in this country, the writer of this volume and Hildebrand in Germany, Axell in Sweden, and Delpino in Italy; the first-named naturalist reducing the sum of his observations to the well-known aphorism that "nature abhors perpetual self-fertilization." The whole of that complicated structure which we call in ordinary language the "flower" of a plant consists, in fact, of the reproductive organs enclosed in a number of envelopes which have for their purpose not only the protection of the essential organs within them, but the attraction of those insects or other animals which are necessary for the fertilization of the ovules.

The contrivances for effecting this purpose, though infinite in number and variety, may be classed under two principal heads, colour and scent. A large number of insects obtain their food chiefly or entirely from the juices of flowers; and the necessity for cross-fertilization renders the visits of these insects as indispensable to the life of the flower as to that of the insect. To enable them to find this food the juices are very commonly scented; a field of clover or beans will attract all the bees in the neighbourhood from a great distance; and if carefully watched the bees will be found not only to carry off with them the honey, but to transfer also a portion of the pollen from flower to flower. Where the juice of the flower does not happen to be scented, the bright colour of the corolla commonly serves the purpose of attracting insects from a distance. Different insects and other small animals have apparently very different ideas of beauty as regards the form and colour of the flower. Humming-birds are said by Delpino to have a penchant for scarlet and for flowers with long wide tubes; hence in countries where there are no humming-birds, as our own, scarlet flowers or those with long wide tubes are very rare among native plants.\* The largest-flowered of European plants,

the peony and several species of convolvulus, are visited chiefly by large beetles allied to the cockchafer; and as we proceed further north to climates too cold for this description of insect, the corresponding flowers also disappear, not being able to mature their seeds without assistance. When fertilization is effected by very small insects, something more than a large conspicuous corolla is required to show the visitors the way to the nectary or receptacle for the honey; hence arises the variegation of flowers, the bands or patterns of colour being almost invariably so arranged as to direct the insect in the way it should go in search of food. As nature seldom provides two contrivances concurrently for the same purpose, we find that variegated (wild) flowers are seldom scented; while the most odoriferous flowers are almost always uniform in colour; the evening-primrose, which opens its scented flowers only in the dusk, requires no variegation to direct the night-flying moths to the scented nectar.

Illustrations of all these laws have been observed by the naturalists we have mentioned, and have been collected with great industry in this volume by Dr. Müller, himself no idle worker in the same field. According to the theory of natural selection those descendants from a common ancestor which vary from the others in any direction that tends to increase their attractiveness to insects or to secure a more certain transference of the fertilizing pollen from one flower to another, will have the best chance of survival and of perpetuating and increasing this peculiarity in their progeny. Dr. Müller has himself examined, or records the observations of others on, nearly four hundred species of plants, and describes the structure of the reproductive organs and of their envelopes, with especial reference to their adaptation for self-fertilization or for cross-fertilization, giving in each case a list of all the insects which have been observed to visit the flower, and illustrating his description, where necessary, by admirable woodcuts. This portion of the subject is more or less familiar to most botanists; what Dr. Müller has made peculiarly his own study is the tracing out of the same principle, applied to the visiting insects, as previous observers have noted with respect to the visited flower. By the same principle of natural selection those insects which display to the greatest perfection contrivances for extracting the honey of flowers or for carrying away the pollen—the latter serving in some cases for their own food, in others for storing up in their nests as food for the larvæ or young—will stand the best chance of perpetuating offspring provided with the same peculiarities; and we find here abundant descriptions and drawings of the various forms which these contrivances assume in different classes of insects.

In his concluding chapter Dr. Müller discusses the origin of these phenomena, and declares himself a firm adherent of Darwin's theory, finding the explanation of every special contrivance on the one side or the other in the principle to which we have already referred. He therefore vigorously combats the teleological views of Sprengel and Delpino, the latter of whom especially, while accepting the theory of evolution or descent with modification, yet disputes the soundness, or at least the adequacy, of the other theory usually associated with it, that of natural selection. He recurs, in fact, to the pre-Darwinian doctrine of design to account for the phenomena which furnish the subject of this work, or, as Müller represents him: "Nature is with him a being endowed with human thought, which has invented definite forms of flowers leading necessarily to cross-fertilization; and this is then completely carried out by the employment of different parts of plants for the same purpose. This creator of flowers, far exceeding in talent the cleverest man, has pre-

\* Among our common wild flowers it would be difficult to name any of a true scarlet hue except the poppy and the little pimpernel.

destined certain forms of flowers for certain insects, and certain insects for certain forms of flowers, and has contrived each one to fit the other." The reasons which may be adduced against this theory would be simply a repetition of the main argument of Darwin's *Origin of Species* and *Variation of Animals and Plants under Domestication*. The believer in the doctrine of natural selection finds it more consonant with the facts which he sees around him to assume that Nature—if it is possible to personify the idea—works, not by preconceived notions and prearranged harmonies, in which case we should expect to find everything perfect, without discord, waste, or incompleteness; but rather, as a human workman would act, tentatively; making small improvements here and slight adaptations there; every form of life, in fact, constantly approaching a more and more perfect adaptation to the circumstances in which it is placed, a perfection which, however, is never absolutely attained.

There are few regions of scientific inquiry more easily open to any observer resident in the country and possessed of ordinary powers of observation than those connected with the fertilization of flowers, and none which would more amply repay careful research by leading to further insight into the still hidden laws which govern the origin of species. To all workers in this field Dr. Müller's elaborate and in every respect admirable work will be an indispensable companion.

ALFRED W. BENNETT.

### Notes on Scientific Work.

#### Geography.

The *Gesellschaft für Erdkunde* of Berlin has happily resolved to publish an account of the proceedings of each meeting of the Society immediately after it has taken place, instead of appending this report to their journal, which does not appear till some time afterwards. The first of these *Verhandlungen* is now before us, and contains much that is of immediate geographical interest.

A communication from General Kauffman, from the wells of Aristanbel-Kuduk on the borders of Khiva, describes graphically the country traversed by the main Russian column; and the astronomical positions which were determined on the line of march are appended.

From Dr. Nachtigal in Central Africa two very important papers, bearing date December, 1872, have been received by the Society, and will be published in full in their journal. They describe Bagirmi, a country lying south-east of Lake Chad, and are accompanied by a map, greatly extending the knowledge of this region derived from Dr. Barth's travels. The description of the present condition of the countries lying round Lake Chad is an exceedingly unfavourable one: wars and plundering appear to be going on in all parts and trade is at a standstill. Dr. Nachtigal's intention is to make his way east from Bornu through Wadai, and thence homeward towards Egypt.

Rohlf, the well-known African traveller, has planned an expedition for the exploration of that unknown portion of the Libyan desert which lies south of the depressed region, discovered by him in 1869, between Cyrenaica and the oasis of Siwah. The Viceroy of Egypt has undertaken to defray the costs of the expedition, to which an astronomer, a geologist, and a botanist are to be attached; it is intended to leave Egypt in December of the present year.

An abstract of a paper by Dr. Schneider on the Dutch Residency of Palembang in the south-eastern part of Sumatra gives a good description of the physical geography, fauna, flora, and inhabitants of this part of the East Indies.

**Arctic Regions.**—The 80th of the series of papers on the progress of geographical research in the Polar Regions, published by Dr. Petermann in his *Mittheilungen*, contains a *résumé* of what is known from all sources respecting the American N. polar expedition under the late Captain Hall, and is accompanied by an elaborate map, in which the results of this expedition, as far as these are known, have been critically compiled, together with data of the former voyagers, Kane and Hayes. The story of the "Polaris" voyage is already well known in England, and no fresh tidings of the ship, which wintered, 1872-73, with the ten remaining members of her company on the coast of Northumberland Island, in lat. 77° 20' N. in Baffin Bay, have reached since autumn of last year. Two vessels however, generously sent by the American Government, have for some time been on their way northward to find and succour the "Polaris" crew.

In his remarks on the general results of this voyage Dr. Petermann draws a remarkable contrast between the advances made by the various expeditions which have been undertaken in steam vessels, and by those in which sledge travelling has been tried; maintaining that, since Hall's expedition has shown that there is no such thing as a permanent covering of ice in this branch of the Polar Sea, sledge travelling is little to be depended on, and steam-ships should alone be employed. The discovery of drift-wood on the shores of Hall land (the east coast of Robeson Strait between 81° and 82° N.) makes it not improbable, Dr. Petermann believes, that the land breaks up here into an archipelago of islands, or at least that there is a communication by which Asiatic drift-wood finds its way hither; and on the other hand the presence of numerous musk oxen in these regions makes it very probable that Hall land is in uninterrupted connection with the coast of East Greenland in Lat. 77° N., explored by the second German expedition of 1870-71.

#### Zoology.

**Cutaneous Exudation of the Water Newt.**—The common *Triton cristatus* of our ponds and ditches appears in its natural state and when undisturbed to be scentless, but when alarmed or irritated it emits an odour strongly resembling that of bruised poppy-heads, which is clearly perceptible in the open air and sufficiently powerful to attract the attention of a person coming into a room where the tritons are being operated on. This perfumed exudation seems to be given off equally by tritons in all stages of growth, and in partially dried specimens the poppy-like smell is very powerful and pungent. If the animal be exposed to the vapour of chloroform a viscid fluid exudes from the pores of the skin collecting over the wet surface after death in a kind of slime which when touched by any abraded portion of the hand causes momentarily acute pain; this acrid fluid can be made to exude from the tuberculated parts of the skin by gentle pressure with the finger. This fluid, moreover, has an acrid taste, produces a feeling of numbness in the tongue, and causes a sensible degree of inflammation in the mucous membrane of the lips and mouth which lasts for some hours and is accompanied by a sense of dizziness and stupor. An analysis of the slime showed it to be similar in composition to serum as regards its chief constituents; the exact nature of the acrid principle was not ascertained, but it appears to have no alkaloid character and to be highly volatile, corresponding in these particulars with the exudation from the skin of the common toad described by Dr. John Davy. The effect of the exudation when discharged direct from the skin of the triton upon the subject of experiment seems usually to be far more powerful than when applied artificially and fully to justify the popular prejudice against these creatures. On the tritons themselves the effect appeared to be painful and stupefying. On a healthy cat there was copious discharge of saliva and foam, and violent and audible action of the jaws. When placed on a human tongue the first effect was a bitter astringent feeling in the mouth with irritation of the upper part of the throat, numbness about the teeth more immediately in contact with the fluid, and a strong flow of clear saliva followed by foaming and violent spasmodic almost convulsive action of the muscles of the mouth; these symptoms were followed by headache lasting for some hours, general discomfort, and in half an hour slight rigor. A paper on this subject, embodying the above facts, by Eleanor A. Ormerod, has just been published in the *Journal of the Linnean Society*, vol. xi, No. 56, pp. 493-496.

**Notes on Reptiles**, by Prof. Barboza du Bocage.—In No. 1 of these Notes Prof. Bocage describes an interesting collection of Reptiles collected by M. Lecomte in New Caledonia: among them are two new species of the genus *Rhacodactylus*, viz.—*R. aubrianus* and *R. trachyrhynchus*; a new genus and species *Ceratolophus hexaceros*; and a new species of *Lepidodactylus*, *L. neocaledonicus*. Specimens of the rare *Rhacodactylus leachianus* and *Corrodophus ciliatus* are also in this collection.—In No. 2 will be found notes on some new rare or little known Reptiles and Batrachians from Eastern Africa. Eleven new species are described: *Hemidactylus cessarii* Saint Jago, *H. gutturalis* Bissau, *Septina copei* Benguella, *Typhlacontias punctatissimus* (gen. et spec. nov.) Mossamedes, *Calamclaps polylepis* Angola, *Prosymna ambigua* Mossamedes, *Psammophyllax ocellatus* Mossamedes, *P. viperinus* Benguella, *Siphonops thomensis* St. Thomas, *Hyperolius huillensis*, *Huilla* and *Hylambates Auchietae* Mossamedes. *Feylinia curviroi* Gray is also redescribed. In No. 3 of the Notes we have *Lioscincus steindachnerii* (gen. et spec. nov.) from New Caledonia; *Lygosoma deplanchei* (spec. nov.) and *Tropidoscincus aubrianus* (gen. et spec. nov.) also from New Caledonia, and *Ophiops nasutus* (gen. et spec. nov.) from Australia. The physiognomy of the last described species is very peculiar, almost establishing a trace of a new and intimate union between the Saurians and Ophidians.

**Double-headed Snake.**—Dr. Dobson exhibited (*Proc. Asiatic Soc. Bengal*, January, 1873) a very remarkable double-headed form of *Lygodon aulicus*. The specimen had almost the appearance of two snakes fused into one at a short distance behind the neck, as each head was perfect and was joined by a distinct neck with the body. Before

becoming completely united the twin necks are connected by a band of skin extending about midway between the posterior extremity of the head and the point of complete union in one body.

**Cheleptera.**—The same indefatigable zoologist publishes a description of a very remarkable new species of *Molossus* (*Nyctinomus*) *M. johorensis* from Johore (*Proc. Asiatic Soc. Bengal*, January, 1873) as well as Notes on the genera *Murina* and *Harpyiocephalus*, of Gray. The latter genus must be united with the former, which will then contain five species, forming a very natural group readily distinguished from all other genera of Vespertilionidae by the peculiarly shaped projecting nostrils taken in connection with the dental formula (*Proc. Asiatic Soc. Bengal*, May, 1873). In the same number of the *Proceedings* Dr. Dobson gives an abstract of a memoir to be published by the Society "On the Asiatic species of *Molossi*." The paper commences with an account of the distribution of the species of this very remarkable and well defined group. Of the five genera of the group two only, *Nyctinomus* and *Chiroleles*, are found in the continent of Asia and its islands. Six species belonging to these genera are described, of which one half are new. By far the greater number of species belong to the genus *Molossus* and are confined to the Western world.

**European Spiders.**—Prof. T. Thorell completes his work intitled *Remarks on Synonymy of European Spiders* by the publication of part 4. This most useful work forms an octavo volume of more than 600 pages and contains synonymical remarks:—1. on the spiders described in Westring's *Aranee Suecicae*; 2. on the spiders described in Blackwall's *History of the Spiders of Great Britain and Ireland*; 3. on some of the spiders described in Simon's *Catalogue Synonymique des Aranéides d'Europe*. In calling attention to this work, we can heartily endorse the opinion of the Rev. O. P. Cambridge that in the compilation of the synonyms the greatest care and accuracy has been shown in determining the identity of species described by various authors. Prof. Thorell has not contented himself with the descriptions alone, but has in many cases compared typical examples from different parts of Europe with great pains and acumen. The date of establishment of both genus and species is prefixed, and the work is one that will prove indispensable to the student of European spiders.

### Chemistry.

**The Action of Heat on Diamond and Graphite.**—To the current number of *Poggendorff's Annalen* (1873, No. 4) a peculiar interest will attach itself, as it contains the last paper of Gustav Rose. Some ten years after the death of his illustrious brother Heinrich, the chemist, the scientific world now sustains an equal loss by the death of the great mineralogist.—One of the leading questions that called for an investigation which has been extended over several years was the theory, held by many and doubted by others, that the diamond can be blackened by intense heat. In the first experiment Rose placed diamonds between carbon points in an exhausted tube and subjected them to the action of one of Siemens' dynamo-electric apparatus. The crystal in each case became red hot and flew to pieces by the too sudden application of heat, but on the surface was found a black crust, a hair in thickness, which would mark paper and proved to be graphite. Another crystal of diamond, enclosed in a piece of dense coke and placed in a plumbago crucible packed with charcoal powder, was heated for half an hour in one of Siemens' regenerative furnaces to the temperature at which cast iron melts without undergoing any change whatever. Another diamond, a cut (rose) diamond, which was enclosed in a crucible as before and heated for ten minutes in the furnace to a temperature at which wrought iron melts, retained its form and the smoothness of its facets but became quite black and opaque and exhibited a strong metallic lustre. The black portion formed a distinct layer of the thickness of a hair covering the unaltered substance within. These results confirm those of Schrötter and appear to justify the view that diamond, though it undergoes no change when exposed to the greatest heat of a porcelain furnace or that at which cast iron melts, is slowly converted at the temperature of molten wrought iron into graphite. When heated in contact with air in a muffle the diamond exhibits another remarkable change: there are developed on the octahedral and cleavage planes regular triangular depressions that resemble those occurring in abundance on the fine crystals from the Vaal River and recall the faces formed on planes of crystals, soluble in acid, by the slow and imperfect etching action of such a reagent; as, for example, the action of hydrogen chloride on calcite. Like them, these depressions on the diamond bear an exact relation to the crystalline form and are determined by certain definite faces, their sides being parallel to the edges of the octahedral faces of the crystal. Measurement with the goniometer showed them to belong to the icositetrahedron, the faces of which have not been met with on diamond. These symmetrically shaped pits can easily be seen by heating a thin plate of bort in a blow-pipe flame and examining it under the microscope. By prolonged heating several small triangular pits will often merge into one large one. A crystal of diamond, even when so reduced in size by oxidation as to be only visible with difficulty, continues to exhibit sharp edges and angles; the

paper is illustrated with drawings of such crystals. A dodecahedron with very rounded faces but smooth and brilliant surface also exhibited the triangular pits often very distinctly; moreover it had a brown colour which was not destroyed by heat, and must therefore be of a totally different nature from that of the topaz or smoky quartz. Returning to the blackening of the surface by heat the author states that some of the specimens of diamond in the Berlin Collection appear quite black by reflected though translucent by transmitted light and that this black substance lying in the little irregularities of the surface is found by its behaviour in fused nitre to be graphite. The relative ease with which graphite and diamond burn was determined by exposing them to the same temperature for the same time when the following amounts of the three specimens mentioned below were consumed:—

Foliated graphite . . . . .	27.45 per cent.
Diamond . . . . .	97.76 "
Granular massive graphite . . . . .	100.0 "

**The Solubility of Ozone in Water.**—Carius published a paper some short time ago in which he showed that, contrary to the views of most chemists, ozone is absorbed unchanged and to no inconsiderable degree by water. As ozone is always mixed with a large excess of oxygen and this mixture does not remain of a constant composition for any length of time the determination of the coefficient of absorption of ozone by water is not an easy problem. Carius has recently been led by comments of other chemists on his former paper to repeat and continue his research in this direction (*Ber. Deut. Chem. Gesell. Berlin*, 1873, No. 12, 806). He gives the preference to Houzeau's method with the silent discharge for the preparation of ozone, as it yields, when oxygen is taken, a gas very rich in ozone, and, when air is chosen, less nitrous acid than when visible sparks are used. In three experiments 100<sup>cc</sup> of liquid at 0° and 0.76 contained in addition to oxygen 1.346<sup>cc</sup>, 0.910<sup>cc</sup> and 0.748<sup>cc</sup> respectively of absorbed ozone. The amount taken up by water decreases very rapidly as the temperature rises: one experiment proved that at 16° 5 and 0.7358 100<sup>cc</sup> absorb 0.611<sup>cc</sup> of ozone. When air was used in place of oxygen the water contained some nitric acid, due no doubt to the oxidation of the nitrous acid by ozone. Rain water without doubt contains ozone, though the pressure exercised by this constituent of the atmosphere is so small that it is highly improbable we could detect its presence even were the air strongly ozonised.

**Combination of Ethylene and Acetylene.**—L. Prunier read a paper at a recent meeting of the *Société chimique* of Paris on the combination of these hydrocarbons which takes place when they are passed through a tube raised to an incipient red heat. The product  $C_4H_6$  forms with four atoms of bromine a tetrabromide,  $C_4H_6Br_4$ , which melts at 113–115° and appears to be identical with the compound the condensation of which Caventou noticed when illuminating gas is subjected to pressure, and the product obtained by Henninger by the reduction of erythrite.

**"Pinolic Acid."**—The acid of Friedel and Silva,  $C_9H_{10}O_2$ , formed by the oxidation of pinacolin is believed by Butlerow to be identical with the trimethylacetic acid that he obtained synthetically from trimethylcarbinol and which melts at 34–35° and boils at 161°. The former observers in a paper read before the *Société chimique* state that during a number of experiments with the acid they did not notice so high a melting point, and treatment with anhydrous phosphoric acid in the cold did not produce a change. Heat caused decomposition and the formation of hydrocarbons and an ethereal product. By fractional distillation however it appears that the melting point rose to 30° and the boiling point to about 163°. The most volatile portions of the crude acid contained a very small amount of acetic acid. A number of salts of the acid were prepared and analysed; among them the characteristic copper salt. The acid is yielded in almost theoretical amount by the oxidation of pinacolin. They now consider that it is probably identical with trimethylacetic acid and attribute the difference in melting point to the presence of impurity in the material examined. Pinacone and pinacolin have a constitution normally derived from the acetone formula and a modification in constitution only occurs when the oxidation of pinacolin to trimethylacetic acid takes place. It is not probable that so slight a reaction as the hydrogenation of acetone should cause a constitutional atomic change, though it may be more readily conceived in the case of oxidation.

**Reduction of Carbonic Acid by Iron Phosphate.**—It has been ascertained by E. N. Horsford (*Sitzber. Wien. Akad.*, 1873, 91) that an ethereal extract of green leaves, which has been separated by hydrogen chloride into two layers, a yellow and a blue layer, contains in both portions phosphoric acid, iron, potassium and calcium. He has further observed that a mixture of sodium phosphate and iron protosulphate in presence of water is able both in light and darkness to reduce carbonic acid to carbonic oxide. From these observations it appears probable that the formation of a solution of a phosphate of iron protoxide may be a preliminary stage towards the production of vegetable tissue from the elements of carbonic acid, water and ammonia. Formic acid, it is well known, may be formed by the direct combination of carbonic oxide and water.

**Lime-Magnetite.**—In a recent number of the *Phil. Magazine* (vol. xlv., 455) Dr. Percy describes a crystallised compound formed by heating iron peroxide and lime in equivalent proportions to whiteness for several hours in a muffle, the atmosphere of which is oxidising. The product has a bright metallic lustre and is made up of acicular crystals exceeding an inch in length; it is very brittle, is magnetic, and has a specific gravity of 4.693. When prepared in larger quantities from haematite and chalk crystals more than two inches long were produced. They have not yet been measured. Dr. Percy regards them as magnetite the iron protoxide of which is replaced by lime.

**Kjerulfsine.**—Von Kobell has described (*Jour. Prakt. Chem.*, 1873, Nos. 5 and 6, 272) under this name a new mineral species from Bamle, in Norway. It has the formula  $2\text{Mg}_3\text{P O}_4 + \text{Ca Fl}_2$ , a small portion of the calcium being replaced by sodium. It is nearly allied to wagnerite, which however contains very little or no calcium.

Writing from Cambridge, Mass., as correspondent to the current number of the *Ber. Deut. Chem. Gesell. Berlin*, W. Gibbs reports on the continuation of his researches on the hexatomic compounds of cobalt.—He has also found that the higher alkaloids form an extensive series of compounds with phosphoric or arsenic acid and the oxide of a metal of the magnesium group which belong to the type of the well-known di-magnesium-ammonium phosphate. Most of them crystallise exceedingly well and are more soluble than the ammonium salt. The alkaloids employed were strychnia, brucia, morphia, codeia, and narcotine. The cadmium salts are most distinguished for their beauty; uranium oxide forms a similar series. These salts are characterised by a remarkably sparing solubility in water and alcohol and may play an important part in analytical operations.—F. H. Williams is examining in the laboratory of Prof. Crafts the action of nascent hydrogen on carbon. He conducts the gas developed by the action of hydrogen chloride on cast iron through tubes cooled with ice and salt and then into bromine. The fluid products, he has found, commence to boil at  $9^{\circ}5$  and the boiling point rises gradually to  $155^{\circ}$ . They have the odour of garlic, turn brown in the light, and contain carbon, hydrogen, and chlorine. The bromine compounds boil between  $120^{\circ}$  and  $179^{\circ}$ , at which temperature hydrogen bromide is evolved. Details of this research have yet to be published.

### History.

**Registrum Palatinum Dunelmense.** The Register of Richard de Kellawe, Lord Palatine and Bishop of Durham, 1311-1316. Edited by Sir T. D. Hardy, Deputy Keeper of the Public Records. Vol. I. (Rolls Series).

THIS volume comprises the first portion of the earliest register extant belonging to the episcopal palatinate of Durham. In England there were only three palatinates, properly so called, those of Chester, Lancaster, and Durham, the last being the most ancient of the three. A palatinate is defined as a territory throughout which its proprietor enjoys certain royal rights and privileges, commonly called *Fura Regalia*, as fully and entirely as a sovereign himself does elsewhere within the realm, in which such territory is situated. Thus the bishops of Durham exercised the right of having their own courts of chancery, exchequer, and admiralty (as well as holding pleas of the crown, pleas of land, &c.), and also a court of wards and liveries. They appointed all the officials, issued all the writs, coined money, received the forfeitures and escheats, held councils in the nature of parliaments (Durham returned no members to Parliament till the reign of Charles II.), granted charters, &c. The question therefore naturally arises, when and how did the bishops of Durham obtain all these powers? To answer the question requires a detailed inquiry into the history of both the bishopric and the palatinate, and Sir T. Hardy has given a sketch of the results of his inquiry in the preface to the present volume, reserving an account of Bishop Kellawe himself for the next.

The investigation is rendered difficult by the fact that the see of Durham does not possess one original episcopal record of ancient date; all its Saxon and Norman grants have been lost, probably owing to the infamous conduct of Bishop Cosin's executors, who burnt eight or nine large chests of documents belonging to the see, for the purpose of preventing any disputes which might arise about the bishop's estates. Bishop Cosin had made the history of the church of Durham his peculiar study

and for that purpose had taken into his possession, for the purpose of compiling a work on the subject, all the grants to the see from its earliest period. These he seems to have abridged in the book which he compiled under the title of *Liber Rubens*, but he never returned the originals into the archives of Durham, and these valuable muniments no doubt were among those which were consumed in the executors' fire. When Edward I. inquired into the origin of the rights of the see, the famous Bishop Antony Bek replied that his predecessors had exercised all these powers from the times before the Norman Conquest without any interruption whatever. And in this view Sir Thomas Hardy is disposed to acquiesce. He derives these privileges from the reverence paid to S. Cuthbert, whose body, when the Danes destroyed Lindisfarne, was transferred by Bishop Eardulf to Durham. The British Museum possesses a most extraordinary memorial of this in the book of the Four Gospels with an interlineary Dano-Saxon version (MS. Cotton, Nero, D. iv.), which during the flight fell into the sea and was some time afterwards found upon the coast; the stains on the back seem still to bear witness to its immersion. S. Cuthbert's services in enabling Alfred to repel the Danes are well known (we need only refer to the account in the second canto of *Marmion*), and successive kings heaped privilege after privilege on the favoured place where the saint's relics rested;

"There deep in Durham's shade  
His reliques are in secret laid;  
But none may know the place,  
Save of his holiest servants three,  
Deep sworn to solemn secrecy,  
Who share that wondrous grace."

Symeon of Durham, the historian, speaks at large of the donations made by the Kings Alfred and Guthred, comprising the lands between the Tyne and the Tees; and even if the original donation were as fictitious as that of Constantine to Sylvester, yet the gradual growth of such an extensive palatinate would equally attest the reverence paid to the great national saint of the North. Sir T. Hardy traces the history of both bishopric and palatinate down to modern times, pausing to dwell more at length on bishops like Antony Bek, or on the attempt made by Act of Parliament in the reign of Edward VI. to subvert the palatinate entirely, by dividing the bishopric into two (the Act, never printed before, is inserted here by the editor), or on the attempt to found a university in Cromwell's time, which was favourably regarded by the Protector, but which Oxford and Cambridge successfully resisted, dreading a rival at Durham, as in other ages at Stamford, or in our times at London. It is curious that when the English set up a university at Caen, in Henry VI.'s reign, Paris sent a letter to Oxford, as to a friendly place of education, remonstrating against this attempt at rivalling the mother university of France and of Europe. Even Bishop Butler stood up firmly for the independent rights of the see; but at Van Mildert's death the palatine jurisdiction was detached from the bishopric by Act of Parliament, and thus this ancient episcopal palatinate, after it had been in existence in its various forms for more than one thousand years, was dissolved, and its immense temporal powers, which had been often viewed with distrust and assailed by many of our sovereigns, merged into the crown.

The MS. now published has had a fortune of its own. It was borrowed in 1640 by an agent of the Earl of Newcastle for the purpose of some lawsuit affecting the property of the Earl, but was never returned. Somehow it fell into the hands of the Earl of Oxford, who parted with it to Osborne the bookseller; he sold it to Rawlinson, and it passed with the rest of that antiquary's collection to the Bodleian. Oxford honourably restored it

to Durham, and in 1868 it was, with the other muniments belonging to the palatinate, removed to the Record Office in London. It is now printed as being of more than local importance, for it abounds with striking and valuable materials illustrative of the general history of England. Thus there is much about Robert Bruce's war with Edward II., and one of the last documents in the present volume is a letter from the Cardinals at Carpentras, describing the outrages perpetrated by the Gascons when the conclave met to elect a successor to Clement V. Many instances occur of the rapacity of the Avignon popes; and the general course of public business in the reign of Edward II. is illustrated in innumerable particulars. The details of public affairs in the Middle Ages have received less attention than they deserve. The deeds of the great nobles as described by Froissart, the monastic life as told by church historians, did not really concern the mass of mankind. The public and social life of those times is only gradually finding historians, the materials for its history are only now being printed. But our editor has reserved for the preface of his second volume the instances which he has collected to show how Kellawe's Register elucidates general and particular history, civil as well as ecclesiastical; and we shall hope to report his conclusions at no great length of time. At the end of the preface a number of passages are collected where the reading of the MS. seems to be corrupt. Some of them may be corrected from similar clauses occurring in other documents contained in this volume: e.g. p. 39 *praemissa extendi, read exercendi* (*c* and *t* are much alike in MSS. and the curled upward stroke for *r* is sometimes very faint); p. 53 *nec in praemissis a juris casibus, read permissis a jure*; p. 141 *de qua cujuscumque toto tenore.....aut defectum, read cujusque.....defectu*; p. 143 *inductum solvi, read judicatum*; p. 165 *et circiter vos, read et circa ea nos*. Several other passages need a better punctuation, and indeed if we had any complaint to make about the edition it would be that it was over-punctuated, the multitude of commas being sometimes prejudicial to the sense.

The earliest document referred to in the volume is a record of Henry I.'s time (p. 8), concerning the fishery of the Tyne, made before the famous Walter Espec, then justiciary: "*Tertia pars aquae erit communis et libera; et eadem aqua mensurari debet ad mayne flod, quando eadem aqua fluit, ut sit plena de banke en banke.*" In p. 26 the following description of a seal occurs: "In quo sigillo, quasi rotundo, de cera rubea, erat quasi quoddam scutum, in quo etiam scuto erant quasi tres cupae, in cujus circumferentia erant literae sic dicentes, *Sigillum Gerardi de Aldenard.*" In p. 90 *mercatoribus de societate Peruch.* should be explained in the margin as "the company of the Peruzzi" at Florence, whose large loans to Edward III. afterwards led to a sort of general bankruptcy in that city. There are numerous licences of non-residence to clergymen for the purpose of studying in some place "*ubi Generale viget Studium:*" in p. 197 a scholar of Merton Hall, Oxford, is allowed to enter holy orders, notwithstanding that he is a born bondman of the bishop; we are reminded of the clause in Henry II.'s Constitutions of Clarendon which forbids the ordination of a serf without the consent of his lord, an old rule which we find also in Ireland and France. In p. 346 is a certificate that John le Lorimer of Auckland was born without a left ear, and had not lost it for crime. In p. 462 a cleric imprisoned for robbery is admitted to clear himself by the oaths of seventeen compurgators, "*cum quartadecima manu sacerdotum et tertia manu clericorum.*" In p. 296 a tournament is forbidden. In p. 300 there is a safe-conduct for Henry Baker, "*gardein et menur des vitailles,*" who was taking provisions to London by sea for the use of the bishop during his stay at the Parliament there.

We could wish that the early registers of other dioceses might meet with such editorial care. Exeter for instance has a register of still earlier date, beginning 1257. The Chapter of Exeter contains members who would do the work well, and we hope that they will some day give us the early episcopal registers of the West—more than half a century earlier than those of Durham, and very important for the history of Western England.

**Historical Essays.** By Edward A. Freeman, M.A., Hon. D.C.L., late Fellow of Trinity College, Oxford. Second Series. London: Macmillan and Co. 1873.

STUDENTS of history, as well as the general reading public, will, we doubt not, receive with hearty welcome this second series of Mr. Freeman's *Historical Essays*, and will find them to fall short in nowise of the attractive style, the erudition at once varied and accurate, and the power of trenchant and perspicuous exposition, which so strikingly distinguished its predecessor. Considering the very large number of topics which are dealt with in the nine essays making up the present volume, the treatment of any one of them in a manner at all approaching to exhaustiveness was of course out of the question. Mr. Freeman, however, is uniformly careful not to put forward any conclusion, without briefly estimating the authorities, and stating the reasons which helped him towards its formation. Many particulars of literary history and criticism, the appreciation it would be just to form of many prominent actors upon the stage of human affairs, are still, and are likely long to remain objects of controversy. Some of these problems Mr. Freeman applies himself vigorously to attack and to solve. His acknowledged talent and well-earned reputation fairly entitle him to undertake tasks with which the strength of but few literary champions is equal to contend.

Among these, it is enough to mention the Homeric question, upon which, perhaps the knottiest of modern controversies, Mr. Freeman conceives that he has worked out a decision which may claim to be accepted as final. The authorship of the two epics is, according to him, one and indivisible. Indeed he goes so far as to declare that the Homeric controversy no longer exists. Unfortunately for this assertion, those who would introduce more or less of disintegration into the *Iliad* and *Odyssey* cannot be reduced to silence, witness the recently published essay of Bonitz, and Mr. Paley's preface to the second volume of his edition of the *Iliad*. Nay more, so high pitched is Mr. Freeman's Homeric orthodoxy, that he takes the Attic poets sharply to task for departing from the canonical authority of the two epics in their scenic presentments of the heroes of the Troic cycle. He even ventures a conjecture, that Homer, as a boy, might have seen in the flesh the much enduring divine Ulysses. The comparative sketch of the three earliest Greek historians, with which the third of these essays commences, is, as a whole, particularly just and discriminative. One statement, however, bearing upon the merits of Thucydides, we cannot help thinking far too highly coloured. "There is hardly a problem in the science of government, which the statesman will not find, if not solved, at any rate handled in the pages of this universal master." Had then the Attic historian any conception of the vast development and complicated life of a great nation, as compared with the narrower range of the Hellenic πόλις, of the momentous political and social import of the commercial and industrial classes, of the manifold perplexities springing from the interactions and collisions of civil and ecclesiastical power? Mr. Freeman, however, virtually cancels his transcendental eulogium of the greatest of ancient historians, by the admission that he is not a quite perfect expositor of the lives and actions of his

own contemporaries and countrymen. Everyone capable of forming a rational judgment will side with Mr. Freeman's refusal to place the pupil of Aristotle, the leading man of the Hellenic race, the propagator of Hellenic culture, in the same category with Attila and Timur, the barbaric autocrats of savage hordes. But it is to be feared, that the want of contemporary authorities, and the many discrepancies occurring in those which have come down to us, must throw almost insuperable difficulties in the way of such an appreciation of Alexander's personal character as shall meet with universal acceptance. The brilliant and comprehensive summary of the rise, the consolidation, and the universal spread of Roman domination forms perhaps the most noteworthy portion of the present volume. Admitting, however, as Mr. Freeman virtually admits, that the imperial phase of Roman power was a necessary evil, or at all events the least in a choice of many evils, the sweeping moral reprobation with which he stigmatizes it loses much of its force and significance.

GEORGE WARING.

**Luis de Leon und die spanische Inquisition.** Von Dr. Fr. H. Reusch, Professor der Katholischen Theologie an der Universität in Bonn.

THIS book is an expansion of a lecture on Luis de Leon, with the addition of carefully compiled appendices. Its value consists in the minute and accurate account given of the process of trial, lasting over five years, at the end of which the eminent professor of Salamanca was declared innocent. He had been accused by some jealous rivals in the University itself, and the two main charges against him concerned the account he had given of the Vulgate, and an unpublished translation of the Song of Songs. He was not badly treated except that the close confinement affected his health, and he once complains of being starved. The lingering five years' trial was however suffering enough for an innocent man. When we hear that Melchior Cano and Arias Montano underwent similar danger, and that even Saint Theresa and Saint John of the Cross narrowly escaped it, we see what a tyranny the Inquisition exercised, so that Döllinger (to whom Reusch dedicates the book) can say that it "crushed out true science in Spain." Bishop Hefele in his *Life of Cardinal Ximenes* tries, somewhat unfairly, to throw the chief blame on the Monarchy which set such a remorseless engine to work. When Luis de Leon resumed his lectures at Salamanca he made no allusion to the past five years, but simply began with "heri dicebamus," in which he has been copied by a professor in a modern university. Professor Reusch supplies just the detailed inquiry into a special case, which of course Llorente could not give in his more general account, when writing his *Critical History of the Spanish Inquisition*.

### Notes and Intelligence.

Mr. Palmer has published in two bulky volumes (Trübner and Co.) further documents illustrative of the history of Nikon. The first of these is taken up with extracts from the travels of Macarius, Patriarch of Antioch, who visited Russia twice: once during the supremacy of Nikon, and once to take part in the synod which deposed him. The narrative of the first journey was written after the return from the second, and therefore is unimpeachable evidence whenever it tells in favour of Nikon. It is supplemented with extracts from Solovieff bearing upon the troubles of Alexis' accession and upon the Polish war; the last is treated too briefly to be intelligible, and from Denisoff upon the Raskolniks, who did not object to Nikon's correction of palpable errors in the service-books, but to his persistent efforts to reduce the Russian Church to exact conformity to the Greek than the Greek Patriarch of Constantinople desired. The Russian Church, even before Nikon's reforms, was stricter and purer than the Greek, although it was yet more ignorant, and had attached itself to a number of accidental symbolisms to which a party was disposed to cling in a spirit of schismatical nationalism. Most of the third volume is taken up with

Paisius Ligurides' History of the Deposition of Nikon, now first published from the MS. in the Synodal Library at Moscow, used by Mouravieff in his history.

Mr. Palmer promises to return to the subject. When he does so it is to be hoped that he will not content himself with establishing that the Russian state was Erastian, Russian courtiers tyrannical, Greek Patriarchs venal, that Nikon had not a fair trial, and was in the right in the special points in dispute. To understand the matter as a whole we need to know whether a wise man would have accepted the position in which Nikon encouraged the Tsar to place him, whether Nikon having accepted it used it with a wise man's sense of its danger, and whether it is safe to judge of the case so exclusively as Mr. Palmer seems inclined to do from Nikon's evidence: Nikon was doubtless an honest man, and Paisius was a rogue, and almost certainly had been a profligate, but a rogue sometimes sees more of a case than an honest man under persecution who insists upon the points which suit him till he loses sight of all the rest.

Father Morris has published (Burns, Oates, & Co.) under the title of *Troubles of our Catholic Forefathers* a first series of extracts from family papers (in this volume the Babworths, Southcotes, and Tichbornes are the chief contributors). The pleasantest part of the book is the homely details about the Ursuline convent at Louvaine and the daughter house at Bruges, both of which were largely peopled by refugees from England; but most of the space is taken up with instances of the sordid harassing persecution for fear of which most of the English gentry gave up the religion they preferred, and which most Englishmen would gladly forget now that it has served its purpose. These are relieved in some measure by the cheerful, ingenious constancy of the minority, who escaped destruction by the intermittent clemency of the court. Their memory would have been more attractive if they had been less ready to collect or imagine "judgments" on the wretched class who made a trade of giving effect to the tyrannical laws enacted to gratify the fanatical bourgeoisie and parvenu landowners, whose delegates then spoke in the name of the Commons of England.

### Philology.

Oriental and Linguistic Studies. The Veda; the Avesta; the Science of Language. By William Dwight Whitney, Professor of Sanscrit and Comparative Philology in Yale College. New York: Scribner & Co. 1873.

SCIENTIFIC intercourse between America and Europe, and particularly Germany, is not so close and constant that all the American journals, in the contents of which we might be interested, can be expected to reach us. Professor Whitney therefore has a strong claim on our gratitude for having made some of his shorter studies accessible to the public in a collected form, and we can only hope that the present volume may meet with such a reception as will encourage the author to republish in the same way some of his other short articles, especially those on accent in Sanscrit.

The first five essays in this volume treat of the Veda. They are better calculated than any other work to serve as an introduction and help to beginners in the study. They present with sober clearness the consolidated results of scientific inquiry, and do not hesitate to indicate the gaps in our knowledge. In the first we have to notice that the term *staubhika* (p. 14) should be replaced by *uttarārcika*. The second, "The Vedic Doctrine of a Future State," introduces us to an important group of ancient conceptions, possessing great interest for the anthropologist, and at the same time gives an example of how the Veda ought to be explained, by itself, not by Indian tradition. The third article, "Müller's History of Vedic Literature," criticises an important work of Max Müller's in a manner at once generally intelligible, and, to our thinking, perfectly just. Whitney acknowledges Müller's great merits in the warmest terms (p. 73) where he says: "There are few other scholars living who can walk with so firm and confident a step through the whole wide-extended field of the Hindu sacred lore, a field hitherto almost pathless in its obscurities and in great part unattrac-

tive in its barrenness;" but he is equally decided in rejecting some of Müller's assumptions, which have no firm foundation in fact, notably his attempt to fix the date of the Veda (p. 73 ff.). It is important to insist again and again upon the uncertainty of the chronology of the Veda, because otherwise an unfounded opinion might easily acquire, in the course of years, an appearance of authority. The fourth essay, "The Translation of the Veda," discusses a controversy respecting the interpretation of the Vedic text which may now be considered as at an end. The Vedas have reached us imbedded in a dense mass of native erudition of various dates, of which Sāyana's commentary on the Rig-Veda (fourteenth century A.D.) may serve as a sample. Some scholars, amongst whom was the late Professor Goldstücker, believed that these commentaries represented a genuine ancient tradition, in the face of which modern scholarship could only listen and believe. It may now, however, be regarded as established that an uninterrupted tradition respecting the interpretation of the Veda has not existed in India, and therefore cannot have been preserved by these commentators, and every one who studies the Veda at the present day takes the liberty of pronouncing judgment on the views of these Indian philologists as he would do in the case of a modern student in Europe or America. This state of the case is set forth by Whitney with clear penetration that cuts off from the adversary all hope of retreat. The fifth paper, "Müller's Rig-Veda Translation," is of more special interest. It is followed by an elaborate essay on the Avesta, in which the notices of the literature of the subject are particularly welcome.

Two reviews of Prof. Hewitt Key and Herr Oppert mark the transition to works of a more general character. It was no very difficult task for Professor Whitney to criticize the strange and isolated views of the former and the pretentiousness of the latter of these writers, and he does so in a very amusing fashion. The eighth article, "Müller's Lectures on Language," belongs to the domain of serious scientific controversy. Whitney does justice to the strong points of the book, and praises especially the admirable skill shown in the choice of examples, but he speaks with severity of its weak sides. He notices as a defect the want of plan in the whole, the carelessness of many assertions, and he goes so far as to call one deduction "simply and solely nonsense." One is tempted to ask whether such strong expressions were necessary: whether these strictures might not have been worded more politely? But Whitney has evidently proportioned the violence of his attack to the resistance which he expected it to encounter, and was persuaded that Max Müller's popularity in England would offer a very strong resistance to any hostile criticism. It seems, in fact, that in England Max Müller's lectures have been in many ways regarded in a false light. When we read in a letter of his to the Hungarian minister v. Trefort, written on the 18th of May, 1873, and published in the *Pesth Lloyd*: "My own lectures on philology have become a school-book in many places (in England)," there is no room for any feeling but astonishment. In point of fact there is scarcely a book less fitted for school use than Müller's lectures. A school-book ought to contain those results of research upon which the majority of those engaged in the special study are agreed, and should refrain as much as possible from the expression of personal opinions which have yet to be proved; Max Müller, on the contrary, in his lectures popularizes not the scientific conclusions generally recognised, but his own personal views. These are at variance on several points with those of his fellow students; some of his assertions respecting, for instance, the so-called Turanian languages or Grimm's law, have been shown to be unten-

able; while upon other points, e.g. mythological interpretations, it is scarcely probable that opinion will ever be united. The English public ought to feel itself indebted to Professor Whitney for calling its attention to this easily recognizable character of the lectures. Of the remaining papers it may suffice to notice two which are also of a polemical character, directed one against Schleicher's, the other against Steinthal's theory of language. I entirely concur in the judgment passed upon Schleicher. As to the criticism of Steinthal, just because I think more highly of the general value of his work than Whitney does, I am bound to admit that Whitney seems to me to have triumphantly refuted the latest statement of his views on the origin of language. But then I also believe that this refutation is addressed to the weakest of all Steinthal's writings. He always has a slight mystical metaphysical bias, and this is very apparent in the passages discussed by Whitney, who conceives that the profit to be derived by philologists from either Lazarus or Steinthal is extremely small. My own experience has been different, and I must confess that in the course of syntactical inquiries I have often derived very considerable assistance from the views of these writers.

It will be seen from what precedes that Professor Whitney's essays are both valuable and suggestive. It would be well if his lectures on the science of language were more studied in Europe, as they doubtless would be if the author were to provide for their publication in a convenient abridgment.

B. DELBRÜCK.

*Palladius on Husbandry*: edited from the Unique MS. of about 1420 A.D. in Colchester Castle. By the Rev. Barton Lodge, M.A. Part I. (Early English Text Society.) Trübner and Co. 1872.

As only the first part of this publication has yet appeared, we find no editor's preface to guide us, since that is of course reserved for the present till the work shall be completed: We are therefore left to our own unaided contemplation of the portion of the text before us. It is, however, not difficult to form a tolerably correct estimate of the work.

Smith's *Classical Dictionary* gives a sufficient account of "Palladius Rutilius Taurus Æmilianus, the author of a treatise *De Re Rustica*, in the form of a Farmer's Calendar, the various operations connected with agriculture and a rural life being arranged in regular order according to the seasons in which they ought to be performed. It is comprised in fourteen books: the first is introductory; the twelve following contain the duties of the twelve months in succession, commencing with January; the last is a poem, in eighty-five elegiac couplets, upon the art of grafting." The date assigned to the work is the fourth century, though there is some uncertainty on this point.

The treatise of Palladius seems to have been very popular in the Middle Ages; one mark of its popularity is the English translation now for the first time edited. Nothing is known as yet about the translator, unless the editor has found some note of him. Something is however supplied by internal evidence, as we shall see presently. The portion as yet published contains the translation of the first book, which is introductory, and of the next ten books, i.e. from January to October; from which it should seem that there are but three books more to come.

It is clear that the editor has taken very great pains with the work. The marginal notes, containing a summary of the text, are very full, and sometimes give an almost complete modern English rendering of the old English verse. Nothing can be more convenient than his system of adding, at the foot of the page, the original Latin words corresponding to the more obscure English words and phrases. This saves a great deal of tiresome reference, and at the same

time brings out the sense of the English very clearly—more clearly indeed than any explanation can do. Such perpetual reference to the original must have been of great assistance to himself, as it certainly is to his readers. The principle is perhaps obvious enough; but obvious principles are by no means always adopted by editors.

Observing these instances of care, it becomes the more astonishing to find that the *exact* forms of the original manuscript do not appear to have been followed. We miss the italics denoting marks of abbreviation, but most of all we miss the use of the letters *u* and *v* in their proper places. Just as in Mr. Arnold's edition of Wyclif's works, and just as in a great many other editions of old English texts, we find the MS. *v* systematically turned into *u*, and the *u* into *v*. Why is this? It may have been all very well when the study of old English was in its infancy, and when critical accuracy was unknown; but why should this pernicious system, which the Early English Text Society has done so much to put down, be any longer pursued? We are not mere infants, unable to read unless the texts are manipulated beforehand so as to make them look easier; we really are getting beyond that stage now, or we ought to be. Experience shows what comes of it; when Mr. Arnold met with the word *cornes* (which is but the old plural of *corn*) in his manuscript, he turned it into *corves*; so here the old English *chenes* (for *chinks*) is correctly printed *chenes* at p. 17, but at p. 218 the singular form *chene* (a *chink*) is mistaken for *cheue*, and then printed as *cheve*! The misprint *cheue* would not have mattered, as it would easily have been set right; but a word like *cheve* is one which only the initiated can understand, and must be a terrible puzzle to a beginner. Of course, as we have not access to the MS., *cheve* may be the scribe's error, and if so there is no more to be said; but it is very suspicious. If the MS. is really written *exactly* as it is printed, it is hard to believe that the assigned date (A.D. 1420) can possibly be right within half a century. There is something wrong somewhere.

The criticism of editorial work is an ungracious task; but we cannot shut our eyes to the fact that the editor seems to have made mistakes which are the result of mere inexperience. Thus at p. 43 we have—

"Palladii primus liber explicit : assit ut unus  
Alpha vocatus et Ω dei mihi Christus homo."

Now any one accustomed to the old Leonine verse misses the rime in the first line; the last word should, of course, be *imus*, which has the advantage of making sense also. Besides which, *unus* would have been written *vnus*, with initial *v*. The author prays that Christ, who is Alpha and Omega, will grant him to finish the *last* book as he has now finished the *first*. Again, in st. 157, p. 40, should not *feetes* be *seetes*, as in the stanza following? So at p. 49 we have *wretched* for *wreched*, where the MS. no doubt looks like *ct*; but as *cc* is so frequently written like *ct* there was no need to print it so. At p. 114 it is suggested that *wordes* is an error for *worldes*; yet it is no error, but merely another spelling; see l. 32 of Dr. Morris's *Genesis and Exodus*, and *werd* for *world* five times in *Havelok the Dane*. The words *cree* for *eree* on p. 79, and *brynnyng* for *brynnynge* on p. 127, are mere printer's errors, such as cannot always be avoided. The emendation *Floures* for *Floure* on p. 148 is wrong; so is the insertion of *and* in the fourth line on p. 213; and so is the insertion of a comma after *wonder* on p. 7, l. 163, as may be seen by referring to any glossary to Chaucer. And lastly, to make an end of fault-finding, we may observe that a *hopper* is not a small square field, as explained on p. 180; though perhaps this is a mere misprint for something else, since the note says—"Clothe thy hopper (small square field) with a

hyæna's skin." The original text says—"Thyne hopre cloth hienes skynne," which means—"Let thy hopper-cloth be a hyæna's skin;" where *hopper-cloth* is a compound substantive, meaning the cloth laid at the bottom of a *hopper* or seed-basket.

On the whole, however, the edition is a good one, and a great gain; we are only pointing out some respects in which it might have been improved.

It further appears that the MS. itself, though fairly well spelt on the whole, is not always correct; there are several places where editorial corrections might have been made to the great improvement of the metre. Thus on p. 31 *shouelle* (*shouelle* in MS.?) should be *shoule*, in order to rime with *oule*. It is remarkable that the same error occurs in most editions of the nursery tale of Cock Robin. The correct reading is clearly, as noted in Halliwell—

"I, said the Owl,  
With my spade and shoul."

The scribe, like many others, sometimes writes *e* for *o*, as *dese* for *dose* (p. 27); and, on the contrary, *o* for *e*, as *holdon* for *holden* (p. 123); *loith* for *leith*, i.e. *layeth* (p. 25). Other errors are *Ereither* (p. 32) or *Er either* (p. 186) instead of *Here either*, i.e. either of them; also *oons* for *oones* (pp. 114, 147); *thens* for *theunes* (p. 30); *een* for *eyen* (pp. 129, 133); *colours* for *coloures* (p. 133); mistakes which entirely cripple the rhythm, as they subtract a syllable from the lines wherein they occur. The necessity of such emendations is especially conspicuous at p. 147, where *oones*, a dissyllable, but miswritten *ous*, is made to rime with *oon is*, two separate words.

Putting aside these and a few similar drawbacks, let us proceed to examine the work as a whole. There are several things which contribute to give it a high value, to some of which we now draw attention. The nature of the book is such that it necessarily contains a vast number of good examples of agricultural words, which are not always easy to find and are yet of much interest to the linguist; whilst it also contains a great deal of information on agricultural subjects, mixed up with several instances of curious folklore and old superstitions, applicable in the first place no doubt to Italy, but not without their occasional counterpart in old England. On many technical points its authority will always be worth consulting. But we more especially wish to draw attention here to one peculiarity, which is perhaps almost sufficient to assign to it an interest of the highest character, and this is the excellent commentary which it will furnish, if duly examined, upon the works of our famous Geoffrey Chaucer. Probably no more instructive commentary upon Chaucer's rhythm has ever appeared. It has hitherto been Chaucer's misfortune that the works of his imitators Occleve and Lydgate are such as to give us next to no help. They did not much succeed in catching their master's rhythm, and their lines frequently halt past all critical mending. This circumstance has cast a suspicion upon our great poet's rhythms; it has made them appear, as it were, too artificial; it has prevented the critics who uphold the smoothness of the flow of his lines from making as many converts as they might fairly hope to make. Here however at last, and it is none too soon, we are able to point to a long poem, *not* written by Chaucer, the author of which really had an ear, and had obtained a very creditable mastery over all the intricacies of the rhythm which he adopted. There can be little doubt that the author had thoroughly appreciated and mastered the metre of Chaucer's *Troilus and Creseide*, the "Man of Lawes Tale," and the "Clerkes Tale." We should infer, moreover, that he wrote no later than A.D. 1400, before Occleve produced his translation of *De Regimine Principum*, and whilst the true ring of the beautiful seven-line stanza was still well perceived. There are a few

Northern words scattered through the poem, such as *inwith* for *within*, *lovyng* in the sense of *praise* (p. 157), *umbigoon* for *surrounded*, and *veer* for the *spring of the year* (as in Barbour), which at once show that the translator of Palladius was not Chaucer, but some one who had at an early period of life lived in the North of England. Yet he must have come South afterwards, and completely mastered the Midland dialect, rhythm and all, so as to have been enabled to reproduce the language of Chaucer in all essential points. Hence the careful reader will find probably a great number of Chaucerian words, since a cursory examination shows us the words *nyghtertale* (p. 33), *pomly gray* (p. 133), *handbrede* (p. 80—Tyrwhitt has *houbdrede*), *arme-greet* (p. 75—see the "Knights Tale"), *been* as the plural of *bee*, *fleen* as that of *flea*, and so on. The expression *His eyen steepe* in Chaucer's prologue has reference to bright eyes; so also in the translator of Palladius, p. 133, we are told that horses ought to have

Thaire eres shorte and sharpe, thaire e[y]en steep[e];  
where we dissent from Mr. Lodge's explanation of "deep eyes," and prefer the opinion of Dr. Morris. Again, as regards the metre, we know that Chaucer makes the final *-es* in the plural of substantives a distinct syllable, so that *swerdes*, for example, is a dissyllable, as in

The brighte swerdës wenten and fro.

In support of this we adduce from the translator of Palladius the extraordinary lines

The chenës, holës, pottës, polës mendë (p. 17);  
Let rakës, crookës, adses, and bicornës (p. 42).

And, of course, other examples are to be found by the hundred throughout the work.

Again, Chaucer often contracts two words into one in certain cases, as *tabide* for *to abide*. So also the translator of Palladius:—

Yit is the chalk or claylonde for to eschew (p. 29);  
Ne wicked worme this catell for to offende (p. 39);

where the metre requires *teschew*, and *toffende*.

So also in other matters. Here, for example, the *e* in the middle of a word counts for a syllable.

To greece her vynë-kyf for dyveres derës (p. 31);  
The moldëwarp the Grekës thus pursue (p. 34);  
Relaxed bereth vynëyerdës gretë (p. 49);  
For moldëwarpe's cattës is to kepë (p. 109).

Here, again, exactly in Chaucer's manner, we find such rimes as *arayës*, *play is* (p. 27); *marës*, *ware is* (p. 28); *seedes*, *nede is* (p. 29); with probably half a hundred more of the same kind. Examples of the final *e* are not very common, for the simple reason that the poet often shows great art in contriving elisions; still the following may be cited.

Yet wenë men that they wol not do soo (p. 39);  
The balkë, that thai calle unerëd lande (p. 44);  
The leendës broodë, playnë bak and streght (p. 129);  
Howe vynës yonge as oldë shal appere (p. 199).

Probably a more careful search would reveal a hundred examples at least; though of course it must be borne in mind that the scribe's spelling is no particular guide. Thus he leaves out the final *e* in the plural adjective *greete*, and wrongly writes

With greet cleen, and tailës longe and wide (p. 129)—  
which is mere discord; whilst he writes *alle* for *al*, *oute* for *out*, and *atte* for *at* in one and the same line, viz.—

Yf alle the swarne oute atte the yatës goo (l. 39).

But these things will not much trouble the student who is aware that the final *e*, as rightly pronounced, is entirely independent of the final *e* as occasionally miswritten.

In like manner on p. 38 we find *gutters* as a rime to *ferë is*; it is clearly miswritten for *gutterës*, a trisyllable.

Another peculiarity of Chaucer is that he rimes words spelt exactly alike, if their significations be not the same; thus, in l. 17 of his prologue, *seekë* (the verb) rimes to *seekë* (plural adjective). Similar examples in our new author abound; thus at p. 39 *stondë* (substantive) is paired off with the verb *stondë*, to stand.

Again, a final *e* is sometimes saved from elision in Chaucer by a cæsura, as in the "Nonne Prestes Tale"—

Of cátapúcé, ór of gáytre béryis—

unless (as some prefer) the cæsura be held to count for a syllable, and the reading be *catapus*, followed by a pause; however, we find in our new author a not dissimilar instance, at p. 39—

So thát thou clémë, ánd this lítel cóste.

But so interesting a subject forms a theme rather for a long essay than for a short notice. We must therefore conclude by thanking the editor very sincerely for the great pains he has evidently bestowed upon what will probably be found hereafter to be a work of no inconsiderable importance. The few blemishes we have pointed out are not such as to detract much from its value, though we do hope we may in future be considered as sufficiently grown-up to be able to read old English, even though every *u* and *v* of the original MS. be retained unaltered.

WALTER W. SKEAT.

Titl Livli Historiarum Romanarum libri qui supersunt—iterum ediderunt Io. N. Madvigius et Io. L. Ussingius. Hauniae: F. Hegel. 1873.

FOR this second edition of the first five books of Livy Madvig has been able to make use of the Veronese palimpsest, edited by Mommsen in 1868, which contains portions of books iii. to vi. Hitherto the text of the first decade has rested on the authority of a MS. corrected in the fourth century for the Symmachi by two copyists called Nicomachus. This archetype is lost, but is represented to us by (1) the Medicean MS. of the eleventh century, and a MS. once at Worms and then used by Rhenanus, (2) a Paris—Colbertine MS. of the tenth century, (3) a Harleian MS. and Drakenborch's Leyden MS.—these only holding the third rank. Madvig has calculated that the original MS. must have contained 144 letters in each column, and this is the number of letters between words which have been written twice by mistake in vi. 42, § 12-13, *causae libenter facturos*, the eye of the copyist having glanced for a moment at the wrong column. This is one of a series of delicate calculations and tests which Madvig has used for the external criticism of the text. At the beginning of his *Adversaria Critica* he has given a most valuable summary of the *causes of error* in copying manuscripts, a knowledge of which is of great service in emending the text. The other means of emendation consists in the internal evidence of style, matter, usage, antithesis, and so on, and it is here that Madvig's great strength lies. Sometimes the two lines of argument, external and internal, coincide; and sometimes a difficulty in the one leads to closer investigation of the other, and fresh evidence is not unfrequently thus obtained. Questions of historical or critical evidence are too often treated as if the object were to convict a criminal, and it seems to be required that the evidence should be such as a jury would accept as legally sufficient. Of course the object is wholly different in literary matters, the balance of probabilities being sufficient for our purpose. The Veronese palimpsest, discovered by Mai, is independent of the one MS. on which we have hitherto depended, and hence its value. In the ninth century some one partially cleaned away the old writing, and wrote Pope Gregory's "Moralia on Job" on the parchment thus obtained; writing materials had become very

scarce, and the supply of papyrus from the East having failed, parchment had become all the more valuable. Under the Moralia, however, we can still read leaves of Virgil, Livy, a Latin translation of Euclid, and some philosophical treatises. The text of Livy in this palimpsest was copied from a different MS. to that which the Nicomachi used about the same time, and we know that Cassiodorus in the sixth century had a text of Livy independent of both the Nicomachean and the Veronese. Unfortunately our new MS. is very badly copied, and the Nicomachean recension is much superior to it. It is difficult to imagine (says Madvig) how any one could have written *consulib. tantissimo* for *constantissimo*, iii. 35, 9, or *qui fuit for quievit*, iii. 51, 7, or made *aut alio loco* out of *Aio Locutio*, v. 50, 5. Still it has preserved the right text in some passages, and confirmed it in others. Thus in iv. 25, 4 the present text has *famem cultoribus agrorum timentes*, where something has been evidently omitted; the new text reads *Famem quoque ex pestilentia, morbo implicitis cultoribus agrorum, timentes*. In v. 53, 1 we read in the editions, *Sed res ipsa cogit vastam incendiis ruinisque relinquere urbem*, where the speaker supposes an objection to what he has been saying. Such an objection however is usually prefaced by *at*, not by *sed*; and the Veronese MS. prefixes a whole clause, *At enim apparet quidem [pollui om]nia nec ullis piaculis expiari posse; sed*, &c. In iv. 26, 12 we gain one new word, *Dilectus* simul edicitur et iustitium, where there has always been a difficulty about the construction. On the other hand, in iii. 56, 12 tollendae appellationis causa, the last word is rightly omitted by the palimpsest. In v. 41, 3, M. Fabio pontifice maximo, the new MS. gives us the ancient and rare name M. Folio, and we can now see the meaning of the Medicean MS. having *M. filio*. The Foslían or Folián family so rarely occurs that Folio was easily corrupted into Fabio. In v. 7, 13 the new MS. has *tum primum equis suis merere equites caeperunt*, thus confirming a conjecture of previous editors, where also a trace of the right reading survives in the Medicean. But in iii. 65, 1, where Mommsen out of the few letters legible in the Veronese constructs the reading *Novi tr. pl. C. M. P. Aricios N. et L. Aternios. cooptavere*, and thinks the Nicomachean text bears traces of an historical and not a mere grammatical interpolation, Madvig with good reason dissents from him. These instances Madvig selects as being the most striking, but in many minor points the value of our new and independent witness is evident. Sometimes the coincidence in error shows that the text was corrupted before the fourth century. In fact in the instance given above, v. 41, 3, Plutarch must have read Fabio, for he says (Camill. 21) *ἐξηγουμένου Φαβίου τοῦ ἀρχιερέως*. Not a few of Madvig's previous emendations receive confirmation from the Veronese readings, e.g. iii. 62, 3, *id consilii animique habiturus sum quod vos mihi feceritis*, where Weissenborn follows the Medicean reading, *quod vos milites geritis*. Madvig's text is certainly by far the most satisfactory text of Livy that we possess, and what he has done for the last decade is something wonderful. It is curious that our MS. for the fifth decade is of the seventh century (at Vienna), and that for the third decade of the eighth (the Puteanus at Paris), whereas hitherto we have had nothing for the first decade before the tenth century. The new MS. is probably of the fourth, and certainly could not have been written before Diocletian, since *consul* and *consules* are represented by *CONS* and *CONSS*; whereas before the age of that Emperor *COS* is the regular contraction. We may add a remark on one passage where Madvig has altered his note, but where the difficulty still remains. In iii. 41, 8 the Decemvirs decide that Appius shall stay at home to manage the city, and Fabius shall take command of the

army. The Decemvirs' reason for this selection is thus given: "Appii violentiam aptiorem rati ad comprimendos urbanos motus; in Fabio minus in bono constans quam navum in malitia ingenium esse." The antithesis seems to require that Appius was kept at home because of his firmness in keeping down civil troubles, and Fabius sent to the frontier because his vigour in command of an army was greater than his civil courage in upholding the good cause (of the Decemvirs' party). If this is so, should we not read *militia*? *Naviter pugnatum, naviter bellum gerere*, and similar phrases, are of constant occurrence in Livy, while *malitia* does not seem to be a Livian word. There is a curiously parallel passage in x. 22, 6, where another Appius is contrasted for his civilian powers with Fabius and Decius, "*viros natos militiae*." In his first edition Madvig inclined to omit *in bono*; now he thinks Livy has confused the different views in his mode of statement, but does not suggest any emendation. What "*constans*" means is clear from iii. 46, 4, *neque decemviro constantiam defore*. In the next paragraph Livy gives his own view of Fabius, but the word "*rati*" shows that in the first sentence he is only stating the Decemvirs' view. "Once," says Livy, he was equally excellent at home and abroad—*domi militiaeque*; now he had assimilated himself to Appius as far as he could, i.e. but was not quite firm enough for the Decemvirs to entrust him with the control of the city.

C. W. BOASE.

Ferrall and Repp's Danish-Norse-English Dictionary. [*F. og R's dansk-norsk-engelsk Ordbog. Fjerde forøgede Udgave ved A. Larsen.*] Gyldendal: Copenhagen. 1873.

HERE for the first time English students are presented with a classified list of Norse words and idioms. That is the peculiarity of Mr. Larsen's edition of Ferrall and Repp. Hitherto that useful and time-honoured work has only professed to be a Danish-English Dictionary. It is an immense advantage, this addition alone; the enormous strides taken by the Norwegian literature, the great importance of the works of Norse writers in our day, and the peculiar northern individuality of those works, unite to make a Norwegian section in the one great Danish-English Dictionary an absolute necessity. Norse words here are plainly marked with \*; and a less obvious, but still valuable contribution to the completeness of the work is made in the selection of exclusively Danish idioms, marked with †. The style of printing is far superior to that of the previous editions; the individual articles are far more modern and copious, and the spelling is corrected so as to be as much as possible in accordance with the latest improvements in orthography.

A Danish dictionary in the present day cannot fail to be a very empirical thing at best. Probably no language in Europe has an orthography so thoroughly unsettled as the Dano-Norwegian has. At first sight it seems as though the literature were sweltering in a chaos of bad spelling, without aim or hope. No two authors agree in form; a page of Ibsen differs from a page of Björnson and both from one of Paludan-Müller. Even the newspapers preserve their independence; *Fædrelandet* is not at all like *Berlingske*, and *Dagbladet* can be instantly distinguished from *Morgenbladet*. One's friends, with perfect indifference, address one as "*Kjære Herr*—," or as "*Kære herr*—," and date from Kristiania or Christiania, from Kjöbenhavn or Köbenhavn, as their own judgment dictates—a condition of things in the highest degree anomalous and almost incredible!

A point or two of firm land gives hope of a settled orthography in the future. Long ago Rask suggested that the spelling of Danish words should be modified in a phonetic

direction, and should more and more assimilate itself to the kindred Swedish spelling, which has already become fixed. The influential and learned, but somewhat narrow-minded Molbech opposed Rask with vigour, and the movement made little way. It was not till 1869 that a determined effort was again made to settle the floating orthography into a distinct mould, approximating the Swedish as closely as possible. For this purpose a meeting was held at Stockholm in that year, attended by eminent scholars from Copenhagen, Lund, Stockholm, Upsala, and Christiania, for the purpose of working together to this end. Among the delegates were Professor Malmström, the linguist J. Lökke, Ibsen the poet, and the antiquarian Svend Grundtvig. The rules laid down by that meeting form the basis of a reformed orthography, and it is interesting to notice that the suggestions of those scholars are being rapidly adopted.

A remarkable instance of the progress made in this direction is afforded by the book now under review. We have before us, side by side with the new work, an old edition of the same dictionary brought out by Mariboe in 1861. It may be interesting to point out some of the changes made. In the first place the letter Q is dropped, and all words which might be looked for under it are found under K. At the same time the letter C has almost disappeared, being merged in all possible cases into K. We notice that such words as *China*, *Chor*, retain the C. Some writers are ruthless in their destruction of this letter; Ibsen (in *Kjærlighedens Komædie*) writes Kinesemur (for Chinese-muur).

The last quoted word brings us to another innovation. This new dictionary rejects double vowels when the second is mute. *Huus* in Mariboe is *Hus* in Larsen. Of like significance is what is called the supporting *e*, a dumb letter following a vowel, as in *dœe*; the new dictionary, in accordance with the suggestion of the Stockholm meeting, spells that verb *dø*. An objection occurs to us here on the ground of confusion of meaning. In the present tense, *han døer* becomes *han dør* (he dies), which exactly corresponds to the noun *Dør* (door), especially if we drop the noun-capital after the extreme fashion of Ibsen and others.

The mute *j* is dropped in the new edition, a change which greatly helps to approximate the language to Swedish in appearance. *Gjøre* becomes *gøre* (Swed. *göra*). Among minor alterations may be noticed the universal adoption of *øj* and *ej* instead of *öi* and *ei*. For example *Flöiten* in Mariboe is *Flöjten* in Larsen. All foreign words remain in a terrible state of confusion, but some phonetic changes of great importance are made. The old-fashioned *Capitaine* is hardly to be recognized under its new dress of *Kaptein*. Among words of foreign extraction we miss several in constant use. We fail to discover *Ekko*, for instance, nor is it given under *Echo*, yet surely it is quite as much in use as the old-fashioned *Gentyl*.

In all the above-mentioned reforms Hr. Larsen has followed the suggestions of the Stockholm meeting. He has not been bold enough, however, to adopt other modifications of no less importance. It is well known that the use of Gothic letters is almost entirely abandoned in Sweden, and by no means universal in Denmark. Two prominent Copenhagen newspapers, *Fædrelandet* and *Illustreret Tidende*, have long been printed in Latin type, and so are many of the best books. It was desired at Stockholm that the Dano-Norwegian language should wholly drop the Gothic letters, but Larsen has continued their use. It was further proposed to drop the use of capital letters for nouns, which according to Rask was not general in Denmark till about 1700, and which is unknown in Swedish. The poet Ibsen alone has been consistent in carrying out this suggestion. It was

further proposed that where *æ* was of no more value than *e*, *e* should be substituted. Ibsen spells *Præst*, *præst*, but he is again alone in this practice.

A more important suggestion was that the sign *å*, having the power of a broad *o* in English, should be adopted from the Swedish in exchange for the *aa* now in use. It appears that the Danish language has repeatedly flirted with the *å*. Rydqvist, the Swedish philologist, believes that it was originally borrowed by Sweden from old Danish MSS. This legendary origin has given the sign a charm in the eyes of the Pan-Scandinavian party, and the use of it is almost a shibboleth with them. Larsen rejects it. He also retains the mute *d* and *h*, and the letter *x*. The mute final *d* no reformer, not even Ibsen, has had the courage to drop, though the Stockholm meeting, in its unflinching rectitude, recommended this also.

Mr. Larsen has had the assistance of Mr. Jacob Lökke, the well-known Norwegian linguist, in his labour of revision, and this adds no little to our confidence in the accuracy of the details, for Mr. Lökke is one of the highest authorities on all matters connected with Scandinavian philology. We heartily recommend this new dictionary to the attention of scholars and travellers.

EDMUND W. GOSSE.

### Correspondence.

To the Editor of the ACADEMY.

Berlin, 27th July, 1873.

SIR,—In a letter dated Bombay, 19th April, and published in your number of June 14th (No. 74, p. 237), Professor R. G. Bhandarkar complains of my inattention to one of his statements with regard to the age of *Paṭāñjali*, as manifested in my letter of the 25th February, published in your number of March 15th (No. 68, p. 118). I beg first to call the attention of Mr. Bhandarkar (as well as that of your readers) to the simple fact that I could not possibly advert at that time to the reiterated statement of his opinions as contained in the *Indian Antiquary* of February last, p. 59; for the February number of that valuable periodical did not reach Berlin before the 3rd March. If, further, I did not pay the attention due in Mr. Bhandarkar's eyes to the first statement of his views (in the *Indian Antiquary*, October, 1872, p. 300) it is certainly not because I "did not see" that those two passages of the *Mahābhāṣya*, of which he there treats, "are distinct" ("still Prof. Weber does not see that they are distinct passages. I am at a loss to conceive how it could be so"), but merely because I could not at all attach to that passage treating on the "sacrificing for Pushpamitra" the same value as he does. On the very day before he wrote to you, the 18th April, I addressed a long letter on the subject to the editor of the *Indian Antiquary*, which will probably soon be published in its columns, and in which I have treated the whole question anew with direct reference to that singular passage, answering all the different proposals made by Mr. Bhandarkar on it and on similar points. In referring to it such of your readers as may be interested in the subject, I beg to call their attention also before-hand to a somewhat extensive dissertation on the *Mahābhāṣya* itself, which is now in the course of printing in vol. xiii. of my *Indische Studien*, and in the introduction of which I have surveyed again, even more fully, the present state of the researches on the age of that work.

As I stated at the end of my former letter to you, on Professor Bühler's authority, that "the Jainas spell the name of the Indian king in question in their Māgadhī-texts *Pupphamitta*, which gives Pushpamitra as the right form," I would add now, that according to a later statement from the same source, received May the 17th, it is but Merutunga in his Vicāraçreni who reads thus, whereas the text itself, on which his commentary runs, has *Pāsamitta*, and this is the reading also of four other texts. The form *Pushyamitra* regains, therefore, its former plausibility; as a *Nāḷshatra*-name it has indeed more appearance of being the true form of the name, than the rather insignificant form

*Pushpa-mitra.* Moreover, the predecessor of the king also is called by the Buddhists *Pushyadharman*.  
A. WEBER.

### Notes and Intelligence.

An International Congress of Orientalists will hold its sittings in the great amphitheatre of the Sorbonne at Paris from the 1st till the 9th of September next. Its purpose is to create personal relations among men interested in Oriental affairs. The following subjects have been set down for discussion:—1. What portions of Japanese literature would it be most useful to translate at this moment, and what are the philological resources for undertaking the publication? 2. Would it not be useful to establish a uniform orthography for the transcription in Europe of all Japanese texts? 3. What are the documents of a nature to facilitate the understanding of the special scientific, literary, and industrial works of the Japanese? 4. What is the nature of the actual movement of Japanese civilization, and of its relations with European civilization? 5. What are the characters of Japanese art at the different epochs, and what method is to be followed for studying them? 6. In what measure has actual Japanese literature, strongly saturated as it is with European ideas, interest for Europe? and may it be thought that the progress realized by the Japanese savants will be of a nature to contribute to the scientific movement of the Eastern nations? The subscription for becoming a member of the Congress is fixed at twelve francs. The offices of the Congress are 49, Rue de Rennes, Paris.—*Pall Mall Gazette.*

We learn that Prof. Summers, who has engaged himself to the Educational Board of Japan, and is about to take up his residence in that country, will continue to edit the *Phoenix*, which will for the future be published at Yokohama. The next number will not be issued before January, 1874.

## THE ACADEMY.

"INTER SILVAS ACADEMI QUÆRERE VERUM."

Vol. IV.—No. 78.

*Readers are reminded that the mention of New Books, Articles, &c., in our lists is intended as a guarantee of their importance.*

*The Editor of THE ACADEMY cannot undertake to return communications which are not asked for.*

*The Editor cannot reply to questions from authors respecting the notice of their books.*

*The next number will be published on Monday, September 1, and Advertisements should be sent in by August 28.*

### Open Scholarships without Examination.

The Hibbert Trustees are prepared to grant at their meeting in December next One or more Scholarships of £200 per annum each, for two years, to Graduates of any University in Great Britain and Ireland, between the ages of twenty-one and twenty-eight, to enable them to study Theology and Mental and Moral Philosophy at Universities in Germany, Holland, or Switzerland (or elsewhere), subject to the approval of the Trustees. Full particulars may be obtained of the Secretary, to whom applications for Scholarships must be forwarded before October 1, 1873.

A. H. PAGET, Secretary.

University Hall, Gordon Square, W.C.

### British Association for the Advancement of SCIENCE,

22, Albemarle-street, London, W.

The NEXT ANNUAL GENERAL MEETING will be held at BRADFORD, commencing on WEDNESDAY, September 17.

*President Designate*—Professor A. W. WILLIAMSON, Ph.D., F.R.S., F.C.S., in the place of J. P. JOULE, D.C.L., LL.D., F.R.S., who has resigned the Presidency in consequence of ill-health.

**NOTICE to CONTRIBUTORS of MEMOIRS.**—Authors are reminded that, under an arrangement dating from 1871, the acceptance of Memoirs, and the days on which they are to be read, are now, as far as possible, determined by Organizing Committees for the several Sections before the beginning of the Meeting. It has therefore become necessary, in order to give an opportunity to the Committees of doing justice to the several communications, that each Author should prepare an Abstract of his Memoir, of a length suitable for insertion in the published Transactions of the Association, and that he should send it, together with the Original Memoir, by book-post, on or before September 1, addressed thus—"General Secretaries, British Association, 22, Albemarle-street, London, W. For Section . . . ." If it should be inconvenient to the Author that his Paper should be read on any particular day, he is requested to send information thereof to the Secretaries in a separate note.

Information about local arrangements may be obtained by application to the Local Secretaries, Bradford.

G. GRIFFITH, M.A., Assistant General Secretary, Harrow.

### Junior Assistant for Photographic and Spectroscopic Observations in the Royal Observatory, Greenwich.

An open competition for one situation will be held in London, on Tuesday, September 30th, and following days.

A preliminary examination will be held in London, Edinburgh, and Dublin, on Tuesday, September 16th.

Limits of age, 18 and 25. Application for the regulations and the necessary form should be made at once to the Secretary, Civil Service Commission, Cannon Row, London, S.W.

*Just Published, Crown 8vo, cloth, price 2s. 6d.*

**The Harveian Oration, 1873, by George Rolleston, M.D., F.R.S.,** Linacre Professor of Anatomy and Physiology, and Fellow of Merton College in the University of Oxford.

## General Literature.

**Chapman's Dramatic Works.** 3 vols. London: John Pearson, York Street, Covent Garden. 1873.

It may well be questioned why Chapman's plays have only now been collected and published in a complete form for the first time. His fame as the translator of Homer, and the praises bestowed upon him by Hazlitt and Lamb, would have justified a far earlier edition in the half century which has reprinted the plays of Middleton and Lilly, Greene and Peele. The reason of this tardy justice done to Chapman may perhaps be found in his own work. Of all the Elizabethan dramatists he is the least attractive at first sight. Though some of his comedies are well conceived and carried through, yet as a tragedian he was unable to construct a plot or to work out the plan which he had laid down with lucidity. In his management of motives, that all important portion of the playwright's art, he was singularly clumsy, and his most highly studied dramas have, broadly speaking, no action or progression whatsoever. They consist of a congeries of isolated scenes. Then again he never knew when to stop in a speech or how to arrange his matter so as to present it with dramatic vividness. The fourth act of *Byron's Conspiracy*, for example, is chiefly made up of a queen's address to an ambassador and his answer, both reported by a third person. Nor could Chapman create characters. His comedies, it is true, are full of sparkling humours well sustained; but the single serious character which appears with any vividness is that of Bussy d'Ambois and Duke Byron—for these are practically the same man, and presumably either Chapman himself or else his ideal of what a hero of romance should be. His language too is very unequal. He could not distinguish between poetry and rhetoric, passion and bombast, so that some of his finest sayings seem to be the result of accident. Whole passages of philosophical reflection or political speculation, well suited enough to an essay or discourse, occur in plays the very life of which ought to be action. The Elizabethan age, rich in men of incomplete genius, whose splendid gifts were under no control, and whose works of art were a rough mixture of dress and precious metal, produced no poet more worthy than Chapman of his own description of those

"That have strange gifts in nature, but no soul  
Diffused quite through, to make them all a piece."

Such a poet could never be popular, especially when his plays are neither romantic nor sensational, but crammed with weighty thoughts and tedious dissertations. Meanwhile Chapman has been called a "poet's poet;" and this title of honour he emphatically deserves. Those who are not rebuffed by his clumsiness, dryness, unreadableness, and bombast, will be repaid by the splendour of special passages, by the "full and heightened style" which Webster celebrated, by the beauty and rarity of occasional images, and by sentences of the pithiest and tersest English. Shelley, it is well known, immortalised the following four lines from *Byron's Conspiracy* by placing them on the title-page of *The Revolt of Islam*:

"There is no danger to a man, that knows  
What life and death is: there's not any law  
Exceeds his knowledge; neither is it lawful  
That he should stoop to any other law."

In the speech from which this quotation is taken occurs a passage of brilliant bravado:

"I am a nobler substance than the stars,  
And shall the baser overrule the better?  
Or are they better, since they are the bigger?  
I have a will, and faculties of choice  
To do or not to do; and reason why  
I do or not do this: the stars have none;  
They know not why they shine more than this taper,  
Nor how they work nor what."

Much excellent criticism as well as sound philosophy occurs by way of illustration in the mouths of the unlikeliest personages. Montsurry, in *The Revenge of Bussy d'Ambois*, well defines a poet's art in the choice of diction:

"Worthiest poets  
Shun common and plebeian forms of speech,  
Every illiberal and affected phrase,  
To clothe their matter; and together tie  
Matter and form with art and decency."

In the same play the theatre is defended on good grounds:

"Men thither come to laugh and feed fool-fat,  
Check at all goodness there as being profaned:  
When wheresoever goodness comes, she makes  
The place still sacred, though with other feet  
Never so much 'tis scandalled and polluted."

The description of Envy (vol. ii. p. 21), the character of Byron (vol. ii. p. 189), the simile of an oak tree torn by

tempest (vol. ii. p. 24), the picture drawn by D'Ambois of a scoundrel to his face (vol. ii. p. 59), King Henry's meditations on the duties and the toils of sovereignty (vol. ii. p. 284), the panegyric of passionate Love in the comedy of *All Fools* (vol. i. p. 117), Tamyra's invocation of the powers of night and silence (vol. ii. p. 33), Cato's meditations on the immortality of the soul and the legality of suicide in the tragedy of *Cæsar and Pompey* (vol. iii. pp. 176, 177, 191), are all of them passages of noble poetry too long to quote. The fault of Chapman is that some of his best thoughts and images are conveyed with a fulness of exposition that is more suited to an orator than a dramatist. He is not content with suggesting: he must needs dilate. Yet he can at times be as terse as the most sententious epigrammatist. Here are some examples:

"How blind is pride! What eagles we are still  
In matters that belong to other men,  
What beetles in our own!"

Or:

"Treason hath blistered heels; dishonest things  
Have bitter rivers, though delicious springs."

Or:

"I fear him strangely; his advanced valour  
Is like a spirit raised without a circle,  
Endangering him that ignorantly raised him."

This brings the whole character of Bussy d'Ambois forcibly before us. In the same way Chapman, when he chooses, can draw a striking picture in a few words. He speaks of "Saxon lansknachts and brunt bearing Switzers." He describes a river rushing violently:

"His foaming back  
Loaded with cattle and with stacks of corn."

The following simile of the lull before a storm is unsurpassable:

"Here's nought but whispering with us: like a calm  
Before a tempest, when the silent air  
Lays her soft ear close to the earth to hearken  
For that she fears steals on to ravish her."

Such are the pearls of poetry scattered freely up and down the plays of Chapman, for the sake of which he will always be read by true lovers of art. Speaking generally, the style of Chapman forms a link of connection between that of Marlowe and that of Jonson. It combines the ruffling extravagance of the one with the ponderousness of the other, Marlowe's fire with Jonson's learning. But Chapman was not a poet in the same sense as Marlowe: the comparison of their several contributions to *Hero and Leander* shows this. Nor again was he as a dramatist on a level with the author of *Volpone*.

Reckoned merely as plays, his comedies are superior to his tragedies. *All Fools*, for example, has the merit of perpetual motion in its quickly gliding scenes and intermingled interests. *May-Day* is rapid in the same style and full of incident. *A Widow's Tears* is the old tale of the Ephesian matron—borrowed from Petronius and somewhat spoiled by a double plot. The conclusion is not well worked out. Tharsalio's conquest of Eudora and the turning of the tables by Cynthia upon Lysander are not in any true dramatic sense accounted for. It may be said in passing that the same weakness of construction underlies the plot of *All Fools*. Marcantio is such an indulgent father that no reason is shown why Fortunio should not marry Bellanora. Yet these comedies as well as *Monsieur d'Olive* and *The Gentleman Usher* are fully up to the Elizabethan standard of the comedy of humour and intrigue, as distinguished both from the grave comedy of Massinger and Jonson and also from the imaginative pleasure-plays of Shakspeare and Fletcher. They rank well with similar compositions by Marston, Middleton, Heywood, and Decker, and are dis-

tinguished by truly laughable scenes in which the manners of the time are mimicked. The same cannot be said about Chapman's tragedies. Here his want of constructive faculty, and his inability to select a truly dramatic story or to present his subject in any spirit-moving fashion, place him as a playwright below Massinger and Fletcher, not to mention such rare masters of their art as Ford and Webster. *Cæsar and Pompey* is a stationary series of heavy scenes "out of whose events," to quote the title-page, "is evicted this proposition: only a just man is a free man." *Alphonsus, Emperor of Germany* is a tissue of plots and poisonings, with a most unfortunate incident for its central point, the mixed atrocity, naïveté, and indelicacy of which could have occupied none but a semi-barbarous playwright through five acts of elaborate dullness. The four plays from French history, *Bussy d'Ambois*, *The Revenge of Bussy d'Ambois*, *Byron's Conspiracy*, and *Byron's Tragedy*, though scarcely better put together than Chapman's other dramas, occupy a higher place because of the fine poetry and deep thought with which he has adorned them, and because they set forth one eminently dramatic personality. In *Bussy d'Ambois* and the Duke Byron, Chapman has realized the character of a brave and heroic soldier, strong to dare but little apt to suffer, gifted with dazzling qualities of mind and body, quick, passionate, and finely tempered, but so overweighted with self-confidence and conceit that he reaches forward to impossibilities and allows himself to be made the instrument of inferior natures. The failure of both these men is the complement of their success. The passion for fame which impelled them to illustrious action degenerates into a mad thirst for glory, and their self-esteem becomes mere swaggering self-laudation. Byron describes himself well enough in these lines:

"Happy Semele  
That died compressed with glory! Happiness  
Denies comparison of less or more;  
And, not at most, is nothing. Like the shaft  
Shot at the sun by angry Hercules,  
And into shivers by the thunder broken,  
Will I be if I burst."

This is in the style of Marlowe's heroes; none of our dramatists have understood better than Marlowe and than Chapman the allurements of inordinate passions—generous affections of the soul, like the thirst for knowledge in Faustus or the desire of empire in Tamburlaine, driven to extravagance. Bussy d'Ambois is cast in the same mould as Byron: but he excites more sympathy, for a chivalrous gentleness is blent in his nature with fiery force; he loves too, and combines the culture of a scholar with the courage of a paladin. Bussy's brother Clermont is a third spirit of the same type, but differentiated by greater modesty and caution. In describing this hero after his own heart Chapman indulges us with some of his most glittering hyperboles:

"What spirit breathes thus in this more than man,  
Turns flesh to air possessed, and in a storm  
Tears men about the field like autumn leaves?"

And so on through a score of sounding lines until:

"All motion spent,  
His fixed eyes cast a blaze of such disdain,  
All stood and stared, and untouched let him lie  
As something sacred fallen out of the sky."

When in their several tragedies, D'Ambois is murdered and Byron is executed for high treason, Chapman makes both of them to die raving in "King Cambyzes' vein," and pouring forth such frothy praises of themselves as would be fulsome even in a paid panegyrist. Thus he enfeebles the effect of characters outlined with boldness and sustained with enthusiasm. We cannot but feel after closing his best tragedy that Dryden was justified in wishing "to burn a D'Ambois annually to the memory of Jonson,"

and that D'Urfey did not underrate its "intolerable fusion." We should have been losers in a purely literary sense by the destruction of any of Chapman's work, since it is singularly characteristic of his age; but if there was a danger in Dryden's days of playwrights being led to imitate his blustering style without a full share of his intellect, the sacrifice of Bussy d'Ambois and of Byron too for that matter would have been a benefit. It is, however, not a little amusing to hear Dryden rebuking the old poet who swayed the republic of letters in the age of James I. much after the fashion of his own dictatorship in that of Charles II. for faults so very like his own—"glaring colours," "dwarfish thought dressed up in gigantic words," "gross hyperbole," "a hideous mingle of false poetry and true nonsense," &c. Chapman, revered as the translator of Homer, as a true philosopher, and as a poet of the first rank, lived to the age of seventy-five and became in his later years a sort of oracle to rising men of letters. "He was a person," says Wood, "of most reverend aspect, religious and temperate, qualities rarely meeting in a poet." Oldys adds that "he preserved in his own person the dignity of Poetry, which he compared to the flower of the sun, that disdains to open its leaves to the eyes of a smoking taper."—He was associated in dramatic labour with some of the best playwrights of the day, with Jonson and Marston and Decker and Shirley. Jonson told Drummond at Hawthornden that he "loved Chapman," and that "next himself only Fletcher and Chapman could make a Masque."

The principle upon which this edition has been made is, to quote the preface, "the *facsimile* principle, a perfectly intelligible and reasonable one, if carried out with undeviating uniformity." Intelligible no doubt this principle must be; but whether it be reasonable, in presenting the works of an old poet to the public, and not to a learned society of antiquarian scholars, may admit of question; and no one can say whether it has been carried out with uniformity without collating all the blunders of the infamously printed originals. In short it is impossible to help regretting that the editors have bestowed pains upon reproducing the misprints, bad punctuation, and confusions of the old copies, which might have been better applied to restitution of the text. I am as adverse as anyone to the principle of unacknowledged conjectural emendations; but I do not see why misspellings of names, mistakes in the *dramatis personæ*, and inversions of letters should be religiously preserved. The following passage chosen at random from *May-Day* is wholly unintelligible:—

"a friendlesse stranger  
(Exild his native countrey, to remaine  
Thrall to the mercy of such unknowne miads  
As fortune makes the rulers of my life)."

Chapman, at the best of times a tedious author to read, becomes painfully wearisome when we have to wade through pages of queer spelling, without divisions into scenes, without a list of characters, and frequently with a most ridiculous shuffling of the persons to whom the speeches are assigned. If Chapman really "supervised in many cases the publication of the original text," as his editors believe, he must have had a patient soul and a singularly low standard of typographical accuracy. In all other respects the edition is satisfactory. Nothing has been spared in the printing, paper, and binding that could impart the agreeable appearance of a genuine old book. The memoir is as complete as the life of a poet of that age can ever be expected to be, and good sense has been shown by its author in the copious extracts from Chapman's critics which he supplies.

J. A. SYMONDS.

**Myths and Mythmakers.** Old Tales and Superstitions interpreted by Comparative Mythology. By John Fiske, M.A., LL.B. London: Triibner and Co.

It is not easy to say whether the above compilation, which is, as its author calls it, "a somewhat rambling and unsystematic series of papers," is intended for the professional student or the general reader.

Mr. Fiske himself has the latter in view when he says in his preface, "I have not attempted to review otherwise than incidentally the works of Grimm, Müller, Kuhn, Bréal, Dasent, and Tylor, nor can I pretend to have added anything of consequence, save now and then some bit of explanatory comment, to the results obtained by the labours of these scholars; but it has rather been my aim to present these results in such a way as to awaken general interest in them."

Under these circumstances it may well be asked why the reader is credited with such an ample knowledge of Folklore in its widest sense as to understand the slightest allusions to subjects often very remote, such as that made to the dancers of Kolbeck, and to the captain of the Phantom Ship (p. 27). Mr. Baring Gould, who mentions these two traditions in his *Curious Myths of the Middle Ages* (1st ed., vol. i., 29, 30), omits to name his authority (which is Grässe, *Der Tannhäuser und ewige Jude*, 2nd ed., Dresden, 1861, pp. 120, 122); but Mr. Fiske should have done so. Similar omissions will be too often felt by the reader, whose curiosity he thus continually balks after awakening it; though this indeed may be one of the means he speaks of "to awaken general interest."

In spite of these drawbacks he has, as we must admit, one qualification for attaining his object, in being completely master of his subject, and in knowing also how to treat it in an attractive manner. He has not failed to make some excellent observations, as when he remarks (p. 115), "Some clever play-wright, I believe it was Scribe, has said that there are only seven possible dramatic situations, that is, all the plays in the world may be classed with some one of seven archetypal dramas: if this be true, the astonishing complexity of mythology, taken in the concrete, as compared with its extreme simplicity when analyzed, need not surprise us." This remark confirms what has been already noticed in other branches of learning concerning the relative extension and narrowness of the human understanding, which seems in its workings to imitate the processes of nature, producing through the simplest means very complex results; so Pliny exclaims:—

"Jam in facie vultuque nostro, quum sint decem aut paulo plura membra, nullas duas in tot millibus hominum indiscretas effigies existere, quod ars nulla in paucis numero præstet affectando."

But Mr. Fiske has a note on the same passage which suggests a very different remark. Mr. Fiske says, "In his interesting appendix to Henderson's *Folklore of the Northern Counties of England* Mr. Baring Gould has made an ingenious and praiseworthy attempt to reduce the entire existing mass of household legends to about fifty *story roots*, and his list, though both redundant and defective, is nevertheless, as an empirical classification, very instructive." Now this list is indeed very instructive, and the attempt very ingenious and praiseworthy, only it is not Mr. Baring Gould who has made it, but the distinguished scholar, J. G. von Hahn, in the introduction to his *Griechische und Albanesische Märchen* (Leipsic, 1864). Mr. Baring Gould has done no more than make some slight changes, not however for the better, in the mode of stating this theory of *story-radicals*, as he calls them, without any acknowledgment to its real author. Mr. Baring Gould is certainly a very learned man, but at the same time the most confirmed literary annexer alive, and many other examples of his art

might be pointed out, though these are really less astonishing than the assurance with which the annexations are practised, not only from out-of-the-way books, but also from works like Hahn's, Benfey's *Panchatantra* &c., &c., which are, or ought to be, in the hands of every student of Folk-lore. Yet so far as I know no reviewer of Mr. Baring Gould's publications has ever been aware of his proceedings, as best appears from the above-mentioned note of Mr. Fiske's, indeed Mr. Fiske seems to put too great faith in Mr. Baring Gould's authority, and would do well to be more cautious in borrowing any of his statements; as, for instance, the following (p. 29): "Tannhäuser was a French knight, and a renowned troubadour." Troubadour indeed! why, the very name of the *troubadour* is right German, as the mere sound of it should have sufficed to warn Mr. Fiske, and a little research would have shown him that Tannhäuser was not a *troubadour*, but a *minnesinger*, who lived about the middle of the thirteenth century, concerning whom, and the causes which made him a mythic figure, minute particulars may be found in von der Hagen's *Minnesinger* (vol. iv., p. 421, ff.) and Holland's "Sage vom Ritter Tannhäuser dessen Leben und Lieder," *Abendblatt zur neuen Münchener Zeitung*, No. 305, 308, 310; cf. Grässe, loc. cit., p. 26.

He belonged to the Austro-Bavarian family of the barons of *Tannhusen*, though later traditions call him a *Franconian knight* (ein *Fränkischer ritter*), which word Mr. Baring Gould has rendered as *French* (vol. i., p. 211), thus misleading his readers, and Mr. Fiske among them, though the latter, to do him justice, does not call the knight a troubadour. Had Mr. Baring Gould cited his authority (Grässe, l. c.) the correction of his mistake would have been easy to attentive students, but he is systematically careless in his quotations as to author, book, and chapter, especially when foreign writers are concerned.

To return to *Myths and Mythmakers*, and without thinking it necessary to develop Mr. Fiske's various statements when he himself has not chosen to do so, I will content myself with pointing out one or two more passages worthy of note. Thus he observes on philological interpretation (p. 210): "The principles of philological interpretation are an indispensable aid to us in detecting the hidden meaning of many a legend in which the powers of nature are represented in the guise of living and thinking persons; but before we can get at the secret of the myth-making tendency itself, we must leave philology and enter upon a psychological study." Similarly, Mr. Tylor remarks (*Primitive Culture*, vol. i., p. 271), "I am disposed to think, differing here in some measure from Professor Max Müller's view of the subject, that the mythology of the lower races rests especially on a basis of real and sensible analogy, and that the great expansion of verbal metaphor into myth belongs to more advanced periods of civilization. In a word I take material myth to be the primary, and verbal myth to be the secondary formation." How much philological interpretation may be abused is self-evident, and has moreover been shown by other writers, especially in reference to nouns proper, but I cannot refrain from repeating here what I have elsewhere said on this subject: "It is quite possible that Lycurgus may some day disappear altogether out of history; his travels have already been declared mythical (Max Müller, *Science of Language*, 6th ed., i, 99); but though the circumstances which seem to point to his solar divinity may be allowed on the whole as of force, I hesitate to assign much weight to the evidence derived from names alone; for though Alkander means Strongman, Lykurgos the Lightworker, Eunomos Good law, and Eukosmos Good order, it must not be forgotten that every proper name originally meant something,

and might therefore be pressed into the service of some theorist: if the Spartan legislator had been called Lakdaemon or Pythagoras instead of Lykurgos, it would have been possible, without much violence, to connect his oracular laws (*ῥήτραι*) with a name indicating a higher, oracle-giving nature (*λακείν, εἰμῶν*), or one that spoke by the inspiration of the Pythian god; in Aristobulos, Aristotle, Homer, &c., it would have been equally possible to see a personification of a mythical legislator who bestowed excellent counsel, or pursued the best ends, or joins everything well together. As to the special question of the solar divinity, though the mythological interpretation is doubtless correct in many cases, it has to be very cautiously applied lest we should end by having everything turned into sun gods at once." These are the dangers to which people are exposed by their names, and from which even the author of *Myths and Mythmakers* himself is not safe; for descending probably from some old viking chief who in his *dreki* swam about the seas, and therefore adopted the name of "Fish" (*fiskr*), and telling as he does such pleasant and curious stories, some future mythologist may see in him only an odd fish—in the metaphorical sense of the word—and deny him an historical existence: a fate that likewise hangs over two other well-known scholars, one, Méon, a Frenchman, the other, Mone, a German, who, as Grimm points out (*Reinhart Fuchs* cclii.), being the first editors of the *Renart* and *Reinardus*, may be proved hereafter, by an easy anagram, to be *au fond* the same person. Speaking of real persons thus struck out from history puts me in mind that the *Erlking* mentioned on p. 124, may certainly be struck out from mythological lore (and from such books as Tylor's *Prim. Cult.*, ii. 282) as Mr. Fiske will feel after reading Wilhelm Grimm's observations in his *Irische Elfenmärchen*, p. lxi. In another interesting paper, that on "Light and Darkness," Mr. Fiske enumerates (p. 126, ff.) a number of amusing tales, all referring to the same subject—the Devil foiled by the superior cunning of mortals. He has however omitted one of this class which relates how a lawyer who had made over his soul to the Evil One by the usual contract, as his life drew to a close and the time for the fulfilment of the bond approached, became alarmed, and after much fruitless consultation with the most celebrated jurisconsults of Europe, decided by the advice of his wife to throw the case into chancery, and thus outwitted Old Nick, who declared himself willing to give up his rights rather than submit them to the decision of that leisurely court. There is a better story of this kind, less fitted for quotation, in Rabelais (Bk. iv., ch. 45-47) of Indian origin (see Ebert's *Jahrbuch der Rom. u. Engl. Lit.*, vol. 3, p. 338), and known also in Italy, as appears by Angelo Gubernatis' *Novelline di Santo Stefano*, Torino, 1869, Novell. 34.

Mr. Fiske (p. 100) refers to an Irish story, in which a number of old women prepare to fly up the chimney by singing, "By Yarrow and Rue, and my red cap too, Hie me over to England." For the manifold magic virtues of rue see Perger's *Deutsche Pflanzensagen*, Stuttgart, 1864, p. 203. Wuttke's *Der Deutsche Volksaberglauben*, 2nd ed., Berlin, 1869, § 133. About yarrow, Perger, in his *Deutsche Pflanzensagen*, only says, "Yarrow is a remedy for convulsions in children, for the plague, and for a murrain in cattle—it was supposed to grow up wherever the tablecloth spread for a meal on Christmas Day was shaken out." It must not be forgotten that according to a superstitious belief of the Tyrolese the crumbs that fell to the ground on this occasion belonged to the dead, and there is a kindred superstition in Russia, mentioned in Ralston's interesting volume, *Songs of the Russian People*, 2nd ed., p. 321; cf. my review in *Gött. Gel. Anz.*, 1872, p. 953. FELIX LIEBRECHT.

## LITERARY NOTES.

In Westermann's *Illustrated Monthly* for August, Freiherr von Maltzan gives a lively and interesting sketch of the life and opinions of a certain Hadschi Wekkes, the only *aufgeklärter* thinker it has been the writer's fortune to meet with amongst the Arabs. Hadschi Wekkes is still living, at Aden, and Maltzan reproduces from a poem of his a wonderfully simple and graphic description of a three days' journey into the mountains which he took with his flock, when a shepherd boy, to seek instruction from a saintly sage, Abdallah, who had taken refuge from the persecutions of strict, orthodox theologians in a haunted ruin. The same poem gives a slightly novel turn to a story the author professes to have heard in childhood, of a magical wood, the trees of which bear at the same time buds, blossoms, and fruit, setting and already ripe. But at the foot of every tree is a glittering serpent with sharp, red tongue, and many of those who have reached the wood through many difficulties turn back at last afraid of the serpent's venom; others, hoping the serpent may be harmless, stretch out their hands for the fruit, but are bitten, and draw back, too late, for the bite is mortal; a very few do not heed the bite in their eagerness for the fruit—which is wisdom and also the antidote to the sting of the serpent—natural human error. The doctrine of Hadschi Wekkes is represented as a very simple, natural rationalism, too simple to make converts in Arabia until he consented to mix a little of the mysticism of the Sufis with his own opinions in expounding them to beginners. He has frequently been accused of heresy by the Mufitis, but the charge cannot be brought home to him; if he is asked what he believes concerning God, he replies: "I believe He is the great Unknowable," which, in Islam, is an orthodox though not the most satisfactory of answers; to a similar inquiry concerning angels, he returns: "I believe that no man can see them"—which again is orthodox as far as it goes, but not quite conclusive as to a belief in their real existence; other questions are parried with the same ingenuity. Hadschi Wekkes believes in human depravity because children and savages are unmerciful, but the last we hear of him is as posing an English clergyman who wished him therefore to believe in the Scriptural account of the Fall, by the argument that Adam must have been bad to begin with or he would not have been tempted by the apple.

In the same journal for July G. Rosen translates some weird, and, from the mythological point of view, very interesting Macedonian poems. The popular beliefs and legends of the Bulgarians, Servians, and Lithuanians are remarkable (much more so than those of the modern Greeks or Albanians) for the abundant traces and relics of paganism preserved in them, a proof of antiquity the more valuable because tradition does not seem to have much respect for the letter of the songs, which vary much from one district to another. Three of the poems translated—"Jana and the Sun," "Little Daughter Todora," and "Stoina and the Dragon"—are valuable examples of unmistakably elemental fairy tale.

## Art and Archaeology.

**The Metopes of Selinus.** [*Die Metopen von Selinunt.*] By Otto Benndorf. Berlin. 1873.

THE brief existence of Selinus from its foundation in 651 B.C., or at the latest 628, down to its ruthless destruction by the Carthaginians in 409 B.C., forms a page of history to which the student of Greek art turns with more than usual interest. Not that artistic activity is known or supposed to have been greater there or of a higher quality than elsewhere then, but because the ruined temples of that city have yielded a series of sculptured metopes which present in one case a most peculiar and in another a most fascinating phase of Greek art, and, in particular, because these sculptures derive much additional importance from the fact that the possible limits of their date are so narrowly circumscribed. We have on the one hand four metopes (vii.-x.)

which cannot be later than 409 B.C. One would say that they must have been executed previous to 415 B.C., the date of the Athenian expedition against Sicily, the commotions arising from it having presumably been too great to permit such undertakings. It is indeed now the uniform opinion that these metopes fairly represent Greek sculpture in the condition in which Pheidias found it, that is, possessed of an overbearing tendency to minute gracefulness, but at the same time feeling its way towards the expression of life in a manner consistent with that tendency. No doubt the style which preceded Pheidias in Attica may have endured to a considerably later period elsewhere, especially in a Doric colony like Selinus. Then we have another set of metopes belonging to what is regarded as the oldest of the Selinuntian temples, and as furnishing the first authentic and as yet the clearest glimpse of that early stage of Greek sculpture when the foreign elements with which it had grown up were being fast eliminated, and the basis laid of a perfectly independent art. It is not within the range of absolute proof that these metopes belonged to a temple erected by the Selinuntians soon after their settlement about 630 or 600 B.C. All that is known is that they were part of one of the oldest of the temples of which we have still the ruins. And it is argued, first, that the character of the work points to the earliest date possible under the circumstances, and secondly that it is necessary to assume as long an interval as can be obtained between the date of their execution and that of the metopes already mentioned as reflecting the style of sculpture current just before Pheidias. Selinus was a prosperous colony from its very beginning down to its destruction by the Carthaginians, and we may be sure that in the first years of its prosperity it did not overlook the first duty of a colony, to erect a temple worthy of the protecting deity of the mother city. The only question therefore is, and it is generally answered in the affirmative, Do these metopes belong to the first temple? To account for the strangeness of the style in which they are executed, it has been found necessary not only to assign them the earliest possible date, but also to charge Egypt, the East, or Etruria, as happened to be the fashion of the time, with a depressing influence on their authors. So far as the East is concerned, meaning Assyria in particular, there is now no doubt of its having largely influenced the early development of Greek art, and though it would be difficult to point out any positively Oriental element in the metopes of which we are speaking, it would not perhaps be far wrong to assume that the native gift of gracefulness shown in the details of the figures could not have been paired with the grotesque stiffness of the action unless in the person of an artist who was growing out of the traditions of a style with which by nature he had no sympathy, and that style, of all others, the Assyrian.

Though these metopes, and especially the earliest ones, have been long duly recognised as works of the highest importance in the history of Greek sculpture, they have hitherto been neither adequately published nor examined with critical thoroughness on the spot. It is therefore with exceeding pleasure that we welcome this work of Dr. Benndorf's, in which regard has been had to both these points with a most satisfactory result. The engravings have been made from photographs, a process which presents a more apparent than real truthfulness unless assiduously watched, as we believe to have been the case here. Much new material, the result of recent or hitherto unsatisfactorily reported excavations, appears both in the plates and in the text. We have first a discussion on the topography and the public events recorded of Selinus, the latter subject recurring again further on, where, in dealing with a most interesting but very fragmentary inscription

recently found, a question arises as to a war between the people of Selinus and their neighbours of Segesta, for which as yet we have only the authority of a reasonable emendation in the text of Diodorus, xi., 86, 1-3. The inscription seems to confirm the justice of the emendation. Then follows an account of the various excavations that have been made, beginning with those of Angell and Harris, two young English architects who spent the winter of 1822-3 in exertions which, though fortunate in the highest degree to our knowledge of Greek sculpture and architecture, must be deplored for having cut off the life of Harris in the full promise of youth. The work thus interrupted was resumed in 1831 at the instance of the Duke of Serradifalco, and was attended with the discovery of three new metopes, besides the recovery of two which the previous excavators had been prevented from removing. From that time nothing more was done until the summer of 1865, when Cavallari, whose experience under Serradifalco entitled him to the position, was appointed by the Italian Government to carry on the work of exploration.

From an architectural point of view the temples of Selinus have occupied a conspicuous position ever since the publication of three of them by Wilkins in 1804-7, and considering that in many points the authorities, such as Hittorff, Bötticher, and Semper, entertain very different opinions, any successful effort to hold the balance evenly between them, and to give an essentially accurate view of the whole question, must be regarded with favour. This Dr. Bendorff has done in the chapters devoted to architecture. It should further be stated that, in order to make his work as complete as possible, he has appended a chapter on the coins of Selinus by the well-known numismatist Dr. Imhoof-Blumer.

ALEXANDER S. MURRAY.

#### NOTES ON ART.

Mr. John W. Wilson, who, it will be remembered, a short time ago presented to the Louvre his newly acquired fine painting by Constable, has now distinguished himself by another act of generosity. On the 15th of August at the Gallery of the *Cercle artistique et littéraire* at Brussels, he opened an exhibition of his magnificent collection of paintings by ancient and modern masters, the whole of the proceeds of the exhibition being devoted to the benefit of the poor of Brussels, which, it appears, is Mr. Wilson's native town. Mr. Wilson bears the whole expense of this exhibition, so that nothing may be deducted from the sum gained for his charitable purpose; and not only so, but he has had a catalogue prepared, which is quite a work of art in itself, being splendidly printed by Messrs. Clay of Paris, and illustrated with fifty-five fine engravings and etchings by the best engravers. This catalogue is sold at twenty francs, likewise for the benefit of the poor. Most of Mr. Wilson's pictures are of the Flemish and Dutch schools, but the English school is represented by some of its greatest painters, and the French school may also be studied in this varied and well assorted collection. The celebrated picture known as "Le Roi boit," by Jan Steen, is perhaps the chef-d'œuvre of the exhibition.

We learn from the *Chronique* that the committee formed for the celebration of the fourth centenary of the birth of Michael Angelo (May 5, 1875) has already arranged the principal articles of its programme. It has been resolved that the complete correspondence of the artist, and all the documents, published and unpublished, relating to his life and works, shall be offered to the public in a magnificent volume "édition de luxe;" that artists shall be invited to send drawings illustrative of his life, which will be photo-lithographed and published as an album; also that all the great works of Michael Angelo and the most important of his drawings shall be reproduced in like manner. It is moreover proposed that a medal shall be struck in his honour; a commemorative tablet placed on the house in which he was born at Caprese, and another on the house which

he so long inhabited at Settignano; that casts from all his principal sculptures shall be placed with his statue of David in the Tribune at Florence, and that the municipality of that city shall be invited to raise a monument in his honour.

Dr. Schliemann, whose excavations at Troy have for some time attracted universal attention, gives in a letter to the *Augsburg Gazette*, written from Troy on July 17, a fuller account than we have hitherto had of his discovery of a chest of valuables—"King Priam's treasure" as it has been called—dug up near the walls of the ancient city. Golden vessels, idols, and objects of personal adornment seem to have been thrown together into this chest in the utmost haste and confusion. In a large silver urn were found two splendid head-dresses, one of which was composed of a chain of gold twenty inches long, to which eight smaller ones were attached bearing a small idol in the shape of an owl's head at each end, apparently meant to hang down over the temples; 174 smaller chains covered with golden foliage connected the two pendants and terminated by a double leaf three-fourths of an inch long. Six bracelets, a diadem of curious workmanship, fifty-six earrings of artistic design, two small vases of the finest gold, and thousands of smaller articles such as buttons, rings, beads, stars, were likewise found in the same urn. None of the earrings it is said bear the slightest resemblance in form to those of the Egyptians, Greeks, Assyrians, or Romans, but are of quite distinct artistic workmanship. Fortunately as the urn had remained upright in the chest in which it had been originally buried, it was possible to carry it away intact, and not one single article that it contained was lost.

French art has experienced a great loss in the death, on the 7th of August, of the eminent landscapist Antoine Chintreuil, at the age of fifty-nine years. M. Chintreuil was a pupil of M. Corot, and his landscapes were usually bathed in the peculiar luminous mist that distinguished those of his master. In the Salon of this year there were two works by him, "Pluie et Soleil" and "Marée basse," both remarkable for their poetic feeling. "Chintreuil," says one of his critics, "laisse une œuvre considérable et peu connue. Il est de la race des artistes dont la célébrité grandit sur leur tombe."

The Antwerp Salon was opened on the 10th of August, and is said to be a large and fairly good exhibition. Among the foreign contributors we only notice one English name, that of Mr. J. W. Oakes. MM. Alma-Tadema, Israels, Portaels, Baron Wappers, and other names familiar to our London exhibitions are to be met with in the catalogue, which comprises no less than 1,256 works.

The *Daily Telegraph* announces that the curious remains discovered by Mr. George Smith in Assyria will shortly arrive in London. One of these is a mythological tablet on which the amorous adventures of the Goddess Ishtar, the Assyrian Venus, are recorded. The Goddess, it appears, was originally married to a Deity called the Son of Life, but she quarrelled with her husband and entered on a series of discreditable amours. She has the fatal power of bringing misfortune on all whom she loves; one object of her passion is changed into an animal and torn to pieces by his own dogs, and others are treated with similar cruelty when the fickle Goddess is tired of them. Only Izdubar, the great Assyrian ruler, has courage to resist her tempting charms, and like Adonis declines the invitations of the Goddess, whereat in a rage she returns to her celestial kingdom, and we may hope becomes reconciled with her husband the Son of Life.

The National Portrait Gallery only acquired eighteen new works during the whole of the past year. The principal of these was the portrait of Sir Thomas Gresham by Antonio Moro. The total number of visitors to the Gallery increased however to 67,039.

The *Chronique* informs us that the picture that has been most frequently copied during the past year at the South Kensington Museum is "The Surprise," by Dubufe: a bust portrait of a lady surprised at her toilette. This clever portrait painter of

the modern French school has met with no less than nineteen copyists, whereas Reynolds and Gainsborough have only had five or six in the same space of time.

Her Majesty's Commissioners, who this year made a collection of the works of John Philip, R.A., and Thomas Creswick, R.A., at the International Exhibition, have decided to follow up this course in future years with the works of other eminent deceased artists of the English school.

John Constable, R.A., Augustus Egg, R.A., David Roberts, R.A., and David Wilkie, R.A., painters in oil, and J. Coney, J. S. Cotman, F. Mackenzie, S. Prout, A. Pugin, J. M. W. Turner, R.A. (architecture only), and C. Wild, painters in water colours, are the artists selected for 1874; and owners of pictures by these artists are invited to lend them for exhibition, and are also requested to furnish as much information about them as they possess.

### New Publications.

AUTHOR OF "SAINT ABE." White Rose and Red; a Love Story. Strahan.

### Theology.

Literature and Dogma. By Matthew Arnold, D.C.L. Smith, Elder & Co., London. 3rd edition.

WHEN I was invited to contribute a critical appreciation of Mr. Matthew Arnold's last book to the columns of the *Academy*, I felt, first, highly flattered by the honour done me, and secondly much alarmed at the prospect of venturing—as a stranger to England and English life—to pass judgment on such a writer in the presence of English readers. Mr. Matthew Arnold passes on the continent for a writer of great—and very English—originality, which places him to some extent in a position of isolation even amongst his own countrymen. There is something in the combination of daring and moderation in his ideas, of tendencies often radical with conclusions generally conservative, that seems exactly fitted to bewilder a continental intellect, especially the intellect of one belonging by birth to the category of "the average sensual man," to which Mr. Arnold thinks the

French nation *in globo* must be referred. How can I venture upon the most modest criticism without exposing myself to the retort provided in advance by a great apostle: "The natural (or sensual\*) man receiveth not the things of the Spirit of God." Nevertheless I have persevered in my undertaking; every country exhibits some intellectual phenomena which have the effect of living paradoxes upon those who can only contemplate them from a distance. A philosopher whose theodicy borders upon what is elsewhere called Pantheism, or even Atheism, who admits none of the Bible miracles, who rejects the Trinity of Athanasius and the supernatural inspiration of the Scriptures, and at the same time calls himself a sincere Christian and a devout member of the Established Church of England,—such a philosopher is for most of us as inexplicable a mystery as that presented to the rigid Protestants of England by the existence of the large class of French fathers of families who have abandoned the Catholic Church, who hate the Roman clergy and are always denouncing or ridiculing them, and yet send their sons to be educated in clerical schools, and allow their wives and daughters to go to confession. If, however, English readers care to have the opinion of a foreigner upon an author and a religious theory which are both strongly national, as well as highly individual, the foreigner can only acquiesce, and prepare to do his best, reminding those who will find his attempt unsatisfactory after all of a proverb current in his native land: "La plus jolie fille du monde ne peut donner que ce qu'elle a;" a point and probably the only point in which the prince of criticism himself would resemble "la plus jolie fille du monde."

At the same time, these circumstances impose a preliminary duty upon us. Mr. Matthew Arnold has not only a great deal of learning, he has also "beaucoup d'esprit." His book is extremely attractive reading, though it treats seriously of the most serious questions. The severity of his arguments is often seasoned with humorous remarks and very ingenious illustrations. He has a way of his own of crushing an opponent while affecting to offer respectful homage, which almost recalls the *Provinciales* of Pascal, and his trinitarian history of the three Lord Shaftesburys is very amusing. One is sometimes perhaps tempted to think that the incessant repetition of the same ironic point which raised a smile the first two or three times of its occurrence, is an offence against good taste. But prudence and courtesy alike warn us not to follow him on to this ground, and we propose to consider his book as if it were not directed against any local opposition, but on its merits, leaving out all the polemical parts, as a book of European interest, discussing what may be justly called a European subject, the desirable and inevitable transformation of Christian doctrine.

Seen from this level, the book appears to us one of the most interesting documents for the contemporary history of religious ideas. It is evident that it must pass amongst conservative theologians for negative in the extreme, not to say nihilistic. But though the author puts aside as so much legend what they regard as the most important truth, nevertheless his intention is, if not conservative, at least affirmative, and his aim to construct rather than to destroy. Like so many other

\* Why that unpleasant epithet *sensual*? There is absolutely nothing to prove that there is more sensuality in France than elsewhere. I think the ingenious author would have been more nearly within the bounds of truth if he had said that in almost everything France represents *the mean* in Europe. There are few points upon which we are not constrained to acknowledge the superiority of one nation or another, but on the other hand, we are second in almost every field to the different nations which surpass us each in their own. A number of details might be alleged in support of this observation, the key to many of our national qualities and national defects.

thinkers of the day, Mr. Arnold has watched the process by which the blows of independent criticism clear away the scaffolding upon which former generations relied with naïve confidence to prop the edifice of their faith and their dearest hope. There are some who resign themselves to remaining stationary amongst the ruins, believing it to be impossible to find materials there for the erection of a new sanctuary where the spirit of modern times might find comfort again as heretofore in peaceable communion with God. But there are others, and Mr. Arnold is of the number, who are too religious, too much attached to the Gospel and to the incomparable joys of which the Christian life is the sole source, to accept this melancholy quietism. Their soul is athirst for the lost, living God, it seeks him with ardour, and they try to reconstruct methodically, in conformity with the dictates of experience, and in harmony with the criticisms of science, that spiritual temple with which humanity can only dispense at the cost of falling below even the moderate level already attained. There is something very noble, generous, religious, and altogether Christian in such an endeavour, even though it were to fail; and Mr. Arnold's theological adversaries, far from reproaching him with what they think his impieties, should congratulate him on his efforts. They believe themselves to possess the treasure which Mr. Arnold thinks is in danger of being lost in their keeping, and desires to rescue for them, for others, and for himself. What more praiseworthy? Would they rather have him appear as an apostle of irreligion, or the demolisher of Christianity? They cannot prevent his state of mind from being shared by many, whose intellects have been formed by modern culture, and who have been brought to the same point, without their own will or prescience, by the general, impersonal march of contemporary thought.

One might define Mr. Matthew Arnold's theology as a religious doctrine with a positivist basis, aiming to develop itself by a purely experimental method. Perhaps he might protest against the word "theology" as applied to his theory of religion and morality; but one must call things by their right names, and however much he may differ from his predecessors or his rivals, a doctrine relating to man, God, the Bible, Jesus, his teaching and the church, is neither more nor less than a theology. Amongst the essential elements of antecedent theologies there are things for which he, evidently, has a supreme antipathy; especially all such as do not admit of experimental verification. It is apparent that the idea of the Personality of God, and of Providence, in the common acceptation of the word, are to him simply, and even revoltingly absurd. He objects to the *a priori* in religion, and if he were to be judged by his premises alone, he might be classed among the absolute sceptics who can see nothing in the religious history of the human mind but a series of dreams, or rather nightmares.

But this would be to do him crying injustice; for how does he proceed in systematising the data of experience?

He starts from the fact, which for him is axiomatic, that the proper object of religion is *conduct*; "to do what we very well know ought to be done;" and that it embraces consequently at least three-fourths of human life. We should notice the very positive persistency with which he returns again and again to this computation. If we wished to be captious, we might ask whether it is possible to measure in this way the proportionate importance of the things which form the whole of human life by the time which is occupied with them; at this rate sleep, with its inevitable adjuncts, occupying a good third of life, would be a formidable rival to religion. But leaving this detail, which does not necessarily affect the validity of the doctrine: *conduct* is then the proper and the very important object of religion. We must

not however treat morality or ethics as simply and entirely the same as religion: there is no antithesis, but a difference of degree. "The passage from morality to religion is made when to morality is applied *emotion*." Then morality, heightened and vivified by sentiment, becomes *righteousness*, the central idea of the Old Testament. God, whose essence escapes all attempts at metaphysical explanation, is, according to the experimental method, "the stream of tendency by which all things fulfil the law of their being;" and since the supreme law of man's being is to develop himself in the direction of morality, God (still experimentally) is recognized by man as "the enduring power, not ourselves, which makes for righteousness."

Such was the God of Israel. The monotheism of the Israelites proceeds from hence; that at the decisive, initial moment of their religious development, out of the many aspects of the "not ourselves" by which nations feel themselves to be overborne, they concentrated themselves exclusively upon that in which the not ourselves "makes for righteousness," and so urges us to happiness. This was the revelation, properly so called, of the Old Testament. For there is no real opposition between natural and revealed religion. The opposite of natural religion is *artificial* religion. The latter adds by way of superstructure to natural or revealed religion, a superstition, or to speak more precisely an *extra-belief*, more accommodating than pure religion to the weaknesses and appetites of the human soul, which perhaps cannot be avoided at certain times and places, but always ends by compromising the pure religion upon which it fastens as rust upon a metal. This was what happened to the Israelites when they added, or rather substituted their messianic chimera for the simple faith in a power which acts upon us, impelling us to righteousness, and through righteousness to happiness; and therefore the work of Jesus was a second revelation, grafted upon and continuing the first. He also took his stand upon the ground of righteousness, and devoted himself to restoring the conception of it in its purity, while at the same time giving a more exact description of its nature. The kingdom of heaven which he announced was still the happiness inherent in the practice of righteousness. The explanation of the value of Christianity is however to be found elsewhere than in the metaphysics of Christians; neither prophecy nor miracles furnish tenable arguments in its favour. To follow Christ is merely to embrace his righteousness and happiness. The originality of Jesus proceeds from a threefold source; his *method*, his *secret*, and his personal charm, that *ἐπίκλεια*, that *sweet reasonableness* which makes his person the strongest of all attractions towards righteousness. His method consists in bringing each man back to the examination of his inner being, to study and verify his moral condition, his needs, his inclinations, his wretchedness, and to try and test himself without ceasing. His secret is that the way to attain to true righteousness is in the act of dying to self, that is to say, of renouncing heroically all the impulses and desires of the carnal man, and the painful side of this indispensable sacrifice is compensated—as, again, is proved from experience—by the peace, the intense joy which springs from it. Such is the revelation of Jesus, brought into relief and strengthened for all ages by his personal sweetness, "the medium through which the method and the secret were exhibited," and which produces "a total impression ineffable and indescribable;" so that his disciples could condense the search after and the practice of righteousness into faith in him and ardent devotion to his person.

Still, amongst those by whom Jesus was surrounded, and still more amongst those who came after him, the *extra-belief* re-asserted itself. Christianity became superstitious,

chiefly by forgetting the *method*, or the constant reference to inner experience. Protestantism was a vigorous attempt to revert to this method, sometimes to the injury of the *secret*, which has been better preserved by Catholicism. Neither of them can aspire to reproduce the mind of Jesus in its purity; the spirit of modern times has made breaches in both strongholds. The common Protestant notions of the Bible, and the Puritanical doctrines, that still retain their popularity, of the Trinity and the Atonement, are particularly exposed to the blows of unanswerable objections. Their only value consists in the meaning which it is still possible to attach to them when translated into the language of the religious morality conformable to the essence of the Old and the New Testament. In undertaking such a translation, it has to be borne in mind that the language of the Bible is not dogmatic, but literary, poetic, approximative rather than technical; yet with this reservation the Bible remains pre-eminently the book of religion, revealing the idea of righteousness in the Old Testament, and in the New, Christ with his method and his secret. A national, historical church, which enlarges its foundations so as to include within it all who call upon the name of Christ and depart from iniquity, is much more in keeping with the present and future interests of religion than the close, narrow, and obstructive societies in which the Puritan spirit delights.

I do not think that I have omitted anything essential in this abridgment of a religious theory which does not err either by excess of vigor or excess of rigor. I might even admit that, taken in their most general sense, the author's conclusions seem to me fairly satisfactory, though I should doubt the possibility of their application to the Established Church of England. I cannot conjecture how far such a radical transformation would be possible to it without risk of apostasy or dissolution. The author evidently has a feeling of filial attachment to the venerable institution, which indeed makes him occasionally unjust to certain doctrines and certain schools. One is surprised to hear so liberal a thinker speak of Socinians, *i.e.* Unitarians, with the disdain of a High Churchman who cannot bring himself to speak of heretics except by the name of their real or supposed heresiarch. He seems on the other hand to forget the mystical profundity of Calvinist doctrines and to refuse to see any but their repulsive sides. Still I am prepared to acknowledge that in the presence of the existing tendency towards excessive subdivisions in religious thought, a truly national church must widen her boundaries as much as possible or cease to exist, and it is sincerely to be wished that the noble Church of England, to which we owe so many illustrious theologians and so many admirable works, may once more become increasingly national in this sense.

But to leave the conclusions and ascend to the premises, which I cannot think clear or admissible. Mr. Arnold's essay in religious reconstruction bears a certain analogy to the one connected with the name of Kant in the superiority accorded to the moral or ethical element over all dogmas, ceremonies, or ecclesiastical institutions. But does he succeed better than Kant in assigning to religion, properly so called, the part which lawfully belongs to it? This appears extremely doubtful. The author indeed tells us that there is a distinction between religion and morality. Morality becomes religion when "to morality is applied emotion." No doubt; but emotion of what? In Mr. Arnold's system I find no emotion except that which we experience at the thought of the "power not ourselves which makes for righteousness." This is his substitute for the answer which we should have thought preferable; that morality becomes religion when it is inspired by the love of God. Now I fear that the majority of souls are so constituted as to be ex-

tremely little moved by the thought of a power which urges us towards righteousness in much the same way as the fall of a body of water makes a mill-wheel turn.

This is the place to state the gravest objection to which this—in many ways seductive—theory is exposed. Mr. Arnold is decidedly too much afraid of the idea of the personality of God. He nowhere explains why it is that the idea repels him, but the repulsion is everywhere apparent. Doubtless he has good reason to protest when he is told that God is a *Person*; for a person is a being finite, circumscribed, opposed to other beings. But it is one thing to say that God is a *person*, and another to say that God is *personal*. By a personal God one understands not a person like you or me, but a God possessing in a far higher degree than mere human persons that consciousness and intelligence which, within the limited circle of our experience, are only possessed by personal beings. It is in vain to ask, how we can verify the fact that God possesses them. In the first place I should answer that the experimental study of the universe discloses too many ends, aims, and harmonious coincidences for it to be rationally possible to deny conscious intelligence to the sovereign mover of that "stream by which all things fulfil the law of their being." But I should say further: As soon as you tell me of a "power not ourselves which makes for righteousness," the first question that inevitably presents itself to my mind is: Is this power conscious, intelligent, that is to say personal? or is it blind, unconscious, impersonal? But why do I necessarily ask myself this question? out of simple metaphysical curiosity? By no means; it is because there depends upon its solution the further question: Shall I worship it or not? Has not Mr. Arnold observed that man no longer worships powers of which he has discovered the nature to be impersonal? Men paid fervent worship to the sun as long as they believed the sun to be somebody. From the moment when they discovered it to be only a burning globe they ceased to feel the slightest devotion to it. If the not ourselves which makes for righteousness is an unconscious force, I cannot feel for it that sacred emotion which raises morality to the rank of religion. Doubtless in consulting my own interest, rightly understood, and in conforming to reason and experience, I may yield to this power which impels me to righteousness, but there will be no religion in my acquiescence, for it will be an affair of calculation, untouched by the faintest emotion. If I were afterwards to find happiness follow from obedience to the impulse, I should only be able to feel towards the beneficent power, which was ignorant of its own existence, something like the sentiment inspired by a mineral spring of which the waters have restored my failing health. In a word, it is this power itself, this not ourselves which makes for righteousness, that constantly reveals to us the fact that it is a Spirit, that is to say not merely an influence, but life, consciousness, and love; and the revelation is made since this notion is necessary to the effect which the Power tends to produce.

It is inexact to say that the pure and simple object of religion is conduct. The moral sentiment did not give birth to the religious. In former times, and even at the present day, we know that intense religion may be found in nations and individuals combined with a very lax moral condition. The truth is that morality and religion are like two sovereigns having an equal title to the supremacy over the human soul for which they contend until at length it is discovered that the only necessary and truly beneficial application of religion to life is its moral application, and that on the other hand morality, to become solid, serious, and constant, must draw its inspiration from religion. This is the Christian view, which does not establish an antithesis between religion

and morality, but maintains their distinctness while making their influence reciprocal. Morality deals with concrete, practical life, such acts as conscience commands; religion is the sentiment, the emotions which man experiences in the presence of the Absolute, whose immensity, omnipotence, and unfathomable mysteriousness attract him, and which he represents to himself in accordance with the best light he has. This, in my judgment, is the point from whence we must start to obtain an exact notion of the relation between religion and morality; and I cannot but think that Mr. Arnold's theory would have been greatly a gainer if he had started from a less meagre, a more living, a more religious conception of the Deity.

He would have been able in this way to give a more plausible explanation of the person and the work of Christ. I agree with the author that Jesus did propose to himself to restore the true idea of righteousness and to point out its real conditions. But upon what do he himself and his disciples evidently suppose his preaching and ministry to rest? Upon the abstract notion of a "Not ourselves" (it may be unconscious), of a moralising force? By no means; but upon a feeling, intense and pure, of the living God, the feeling of God as a father. But such a sentiment is absurd in relation to an impersonal God, it is only possible or suitable in relation to a God who possesses,—granted in an indescribable degree,—but still really possesses those perfections of existence to which the conscience, the intelligence, the power of loving in man are but feeble approximations. It is only by doing great and constant violence to the gospel history that it becomes possible to separate the moral preaching of Jesus from the directly religious basis upon which it rested throughout.

Several other historical objections might be urged against this theory of purified Christianity. For instance, the history of religion by no means confirms the statement that the proper object of religion, in itself and considered in its original manifestations, was conduct. Neither can I see that history confirms Mr. Arnold's explanation of the intuitive monotheism of the ancient Israelites. Monotheism, according to history, was at first nothing more than a simple *monolatry* which only developed into a monotheism based on principle, through the action of events and of the great prophets posterior to David and Solomon. The use which Mr. Arnold makes of the fourth gospel is extremely arbitrary, and contrasts strangely with his advanced views on the general subject of Biblical interpretation. It seems at times as if he had lost sight of the formidable arguments brought by contemporary criticism against the historical character of the words attributed to Jesus in this gospel. We ought never to forget that this remarkable book, as a great and ingenious critic has observed, makes Jesus say in the first person what every Christian heart says to him in the second.

But I cannot end my examination of the work without again doing homage to the intentions and the talents of the author. I have seldom read a book more penetrated with the great need that the present age feels for a religious renovation that, without breaking with the past, will do justice to the progress accomplished by the general intelligence. Even while feeling called upon to protest against sundry allegations, I regard the general impression left by the work as wholesome and encouraging. We who agree with the author as to the necessity of recasting Christian teaching, who believe, with him, in the future of Christianity, better understood and restored to something nearer its original shape, who think, with him, that neither dogmas, priests, nor ceremonies can save, but only a disposition of the heart thirsting for righteousness, must sympathise with all the noble and upright efforts which contribute to the edification of that

future church in which all those who love Christ and his righteousness will meet together. The imperfections or omissions in particular works ought not to discourage us respecting the collective result. It is a school for mutual instruction where every one teaches the others and learns from them. All co-operate in the great work of the kingdom of God; and even while maintaining my criticisms I sincerely wish and hope that England may send us many more books as powerfully conceived, as boldly written, as instructive and giving as much food for reflection as this of Mr. Matthew Arnold.

ALBERT RÉVILLE.

*Hermæ Pastor.* Veterem Latinam Interpretationem e codicibus edidit Adolphus Hilgenfeld. Lipsiæ. 1873.

In 1866 Professor Hilgenfeld gave us a beautiful edition of the Greek text of the *Pastor*, from the Sinaitic and Leipsic manuscripts, in his *Novum Testamentum extra canonem receptum*, and he has now increased our obligations to him by restoring the text of the old Latin version. It is a work for which previous labourers had prepared the way, but which was still waiting for completion. The *princeps editio* was that of Faber Stapulensis (1513), in which many arbitrary changes were made in the text, chiefly in the direction of a more classical Latin, and this has formed the basis of the vulgar text. After him Cotelierius collated three Paris manuscripts, one of which, containing, however, only a small fragment at the beginning, belongs to the ninth century. Fell collated two English ones, judged by Hilgenfeld to be of great value. These labours were made use of by subsequent editors. In 1857 Dressel edited the *Pastor* in his works of the Apostolic Fathers, with the readings of a Vatican manuscript of the fourteenth century, and also printed for the first time another Latin version from the Palatine codex, on which, however, he set much too high a value. Hilgenfeld, while availing himself of the various readings of the French and English manuscripts, has taken as the basis of his text the Vatican and another manuscript allied to it, belonging to the Dresden library, in which the *Pastor* was found between the Psalms and the Proverbs of Solomon. This manuscript also belongs to the fourteenth century.

It is needless to say that Hilgenfeld has done his work as an editor with great care and judgment, abstaining from making needless changes and indulging very sparingly in critical conjecture, but not fearing to return to the readings of the manuscripts where they have been altered into better Latin. Such words as *horripilatio* (Vis. iii. 1), which, however, was the reading of Faber, *tenebrabitur* (Mand. v. 1), altered into *obscurabitur*, or such a phrase as *sedit singularis* (Vis. i. 2), for *sola*, have a savour of barbarism which bespeak their genuineness. I cannot understand however why, in Vis. ii. 3, one of the passages on which Tischendorf relied to prove the text of Simonides to be a translation from the Latin, Hilgenfeld should give us *dices autem Magno: Ecce tribulatio*. If he relied upon the Greek it should of course be *Maximo*, but otherwise there seems to be no objection to the Vatican reading *magna ecce*, unless he preferred that of his own Dresden manuscript which gives *magna vere*. In other instances he makes a judicious use of the Greek. Thus for the vulgar *per quandam locum ad dexteram* (Vis. i. 1), where the Greek has *δε ἀνοδίας τινός*, he reads *per quandam locum desertum*. Again (Vis. i. 3), where the Vatican seems hopelessly corrupt, reading *Tamquam errarius producus domum opus suum opricum ei cui vult*, for which the *princeps editio*, omitting *domum*, has conjecturally, *exponit cui vult*, the Greek *περιγίναται τοῦ πράγματος οὗ θέλει* suggests the true reading *obtineat rei cui vult*, which moreover is confirmed by the reading of the old Parisian fragment, which has *obtineat*. In some instances it may be that

Hilgenfeld has deferred too much to the Greek, but on the whole his text is no doubt as near an approach to the original form as we are ever likely to have. ROBERT B. DRUMMOND.

### Physical Science.

A *Catalogue of the Collection of Cambrian and Silurian Fossils contained in the Geological Museum of the University of Cambridge.* By J. W. Salter. With a Preface by the Rev. Adam Sedgwick, Woodwardian Professor of Geology in the University of Cambridge; and a Table of Genera and Index added by Professor Morris. Cambridge: University Press.

A THREEFOLD interest attaches to the volume before us. It is, as its title indicates, specially intended to be a reference-catalogue to the older palæozoic fossils in the Woodwardian Museum, the margin of each page being furnished with letters of reference corresponding with similar initials painted on the cases and drawers of the Museum.

But in addition to this primary function, it is of the highest value to geologists and palæontologists engaged in the investigation of the older rocks, on account of the lists of genera and species which it supplies, arranged in zoological order, yet divided into stratigraphical series. Each species is also furnished with authentic localities and illustrated by numerous woodcuts, which are at least of generic if not of specific value, in all cases. Several small but instructive sections are also given. Of great geological interest must likewise be reckoned the "Table showing the classification of the Lower Palæozoic Rocks," carefully drawn up by Professor Morris, who has also supplied a

summary of the contents, together with a "Table showing the range of the genera as indicated by this Catalogue."

Lastly, the *Catalogue* derives both a historical and biographical interest from the fact, that though the preface was dictated by Professor Sedgwick himself only four months before his death (when in his 87th year), yet it retains in a remarkable degree the clear, earnest, forcible style of eloquence for which his discourses before the University had long ago rendered him justly celebrated.

Prefaces were always peculiarly fascinating to Sedgwick, that which accompanies his *Synopsis of the Classification of the British Palæozoic Rocks*, published in 1851-5, extending to 106 pp. 4to. The present preface is only 33 pp. in length; in it he gives us the history of the commencement and completion of the *Catalogue*, involving the record of the sad story of poor Salter's failing health and death, and the reiteration of his own ailments—a favourite prelude to all his lectures, letters, and conversations for many years past. Passing from this we come naturally to the history of the gradual formation of the collection, and the sources from which it has mainly been derived. Considering how entirely Sedgwick devoted himself to the promotion of the interests of the University, and especially to the task of making the Woodwardian Museum under his care a really valuable and instructive repository, it is but a small share of credit which he claims when he says "the following catalogue of all the older palæozoic fossils in the Woodwardian Museum consists of specimens which have been collected by myself, or presented by my friends, or obtained by purchase during my very long tenure of office as Professor of Geology."

It is a fact that, when Sedgwick commenced to lecture, he had to collect the specimens as well as provide by his own geological labours in the field the maps and sections required to illustrate his discourses.

And here it may not be out of place to observe that prior to Sedgwick's election in 1818 the professorship seems to have become almost a sinecure, scarcely any lectures on geology having ever been given.

This chiefly arose from the singular nature of the formal duties of the Geological professor, who, according to the will of the founder, was specially appointed for the purpose of defending Dr. Woodward's views as to the nature and origin of fossils against the attacks of Dr. Camerarius of Tübingen, and his disciples or followers, an engagement to this effect being entered into by each professor on his being appointed to the chair. A sum of £10 annually had been specially left by Dr. Woodward to defray the expense of foreign correspondence and for the purchase of additional specimens; but Sedgwick's predecessors considered it wiser to devote the money to other purposes, so that, when he received the appointment, the collection of which he was put in charge consisted solely of the original cabinet of British and foreign fossils and minerals brought together in the seventeenth century by Dr. Woodward.

It is only justice to Prof. Sedgwick to state that from the first he set himself vigorously to work to remedy this deficiency, and that the £10 a year was not only spent, but was often supplemented by several hundreds of pounds besides, no small part of which was contributed by Sedgwick himself. Among the more important additions to the Museum may be mentioned Count Münster's collection, Mr. Image's Chalk fossils, Fletcher's Silurian Crinoids and Trilobites, and Leckenby's magnificent museum of Oolitic fossils, chiefly from Yorkshire, beside vast stores of specimens added from time to time from the Cambridge Greensand and the Chalk and Tertiaries, principally by the personal labours of Mr. Henry Keeping, whose services

as keeper of the Museum have now for some years past been retained by the Syndicate of the University.

Sedgwick not unfrequently spent his entire vacation in geological explorations in Cumberland, Wales, Devon, or Cornwall, Scotland or Ireland, the Alps or Rhenish Provinces—sometimes in company with Murchison (who about this period (1825) had commenced his geological career)—often alone, or with the then youthful J. W. Salter in Wales, or his faithful henchman John Ruthven in his native dales of Yorkshire, or in Lancashire and Cumberland. Nor did he ever forget to collect materials for his geological museum in Cambridge, the promotion of which was a subject ever near his heart from first to last.

Sedgwick was the last man to undervalue the importance of having the collections under his charge carefully and well arranged in the manner best adapted to advance the study of geology in the University. With this view he secured the assistance of a succession of able coadjutors in the persons of Ansted, Jukes, Salter, McCoy, Barrett, and Seeley, under whose hands the treasures of the Museum were gradually brought into order, and in many cases described.

Thus the fine collections of palæozoic fossils gave origin to the *Descriptive Catalogue* of Prof. McCoy, published in 1851-55, and to the contributions to British palæontology of the same author; more recently again Mr. Seeley has published a catalogue of the Reptilia of the Secondary Strata, and a descriptive catalogue of the remains of Ornithosauria from the Cambridge Greensand founded on the specimens contained in the Museum; while the present catalogue by Mr. Salter was intended to form a supplement to McCoy's larger work.

It is natural to find that by far the larger share of Sedgwick's preface is taken up with a statement of the grounds upon which his original classification of the Cambrian rocks rests, and how it came to pass that the two fast friends, Murchison and Sedgwick, were estranged from each other, and how to this day the borders of the two great kingdoms of Cambria and Siluria remain a matter for controversy, which even the death of both their kings has not succeeded in bringing to a satisfactory conclusion. Professor Sedgwick writes as follows:—

"The stratigraphical system of nomenclature adopted in this Catalogue is essentially the same with that of Prof. McCoy's synopsis. It is based upon an actual survey, first made by myself, whereby I approximately determined in N. Wales the order of the older deposits of the whole region, and the natural groups of strata into which they might be separated.

"This might be called a great but rude problem of solid geometry, to be first solved by an elaborate examination of physical evidence, and without reference to the organic remains in the successive groups. But these groups being once established on the basis of true observation, we may then proceed to obtain the first chapters of a true history of the succession of organic types, as the tale is told in the successive strata whence they have been derived. And when we have once obtained in any extensive section a true succession of organic types, we may then, as Nature is true to her own workmanship, advance a step farther, and use that succession to help us in making out the order of the physical groups in cases where we have been imperfectly or obscurely elaborated. Thus we have two great principles of arrangement: first, by actual and laborious observation of the successive physical groups; secondly, by the order of the organic types which have been already established by a reference to the types of some well-known natural section.

"In determining a geological nomenclature these two great principles must never be lost sight of. No true nomenclature can be in conflict with the actual succession of the physical deposits; neither can it contradict the true succession of organic types. Nature does not contradict her own workmanship. This was the principle on which William Smith, whom we call the father of English geology, acted; and it was the principle on which Murchison acted when he first made known his beautiful succession in the upper part of (what he taught us to call) his Silurian system. That upper part of his system was thoroughly and beautifully worked out, and was accepted at once, and continues to maintain its place. But below the Wenlock shale, in what he called

the Lower Silurian groups, his fundamental sections utterly broke down, having no base to rest upon. He never made out the succession of his physical groups: some of them which required separation he confounded and some he put in an inverted order; and thereby he brought an inevitable incongruity into his lists of the Older Palæozoic fossils. In short, I venture to affirm that the Lower Silurian nomenclature, however widely adopted on the authority of its author, was false, because it was built upon sections that were untrue to nature; and if this assertion be true—and it is true—the discussion requires no farther argument.

"As a general rule honest truth and good taste go hand in hand; and what can be more incongruous and tasteless than to erase the classical name of Cambrian as applied to the grand mountain chains of Caernarvonshire and Merionethshire, and to substitute the word Silurian as their designation? This was done by the author of the 'Silurian system' in the first instance no doubt by mistake, and in the hope of giving a greater extent and firmer basis to his system. But when the great errors of his fundamental groups were discovered, why continue such a monstrous abuse of nomenclature? Siluria supplies us neither with the best types of the older groups, nor with any sections which clearly define their succession: Cambria supplies both. Our business here is not to consider what great service the author may have done in other regions, but to consider whether his work in Lower Siluria be true to nature. The first publication of his grand lists of 'Lower Silurian Fossils' was a great boon to geology; but the assumed stratigraphical arrangement and the grouping of the species has been a great mischief, and a drag upon its progress" (p. xiii. Introduction).

The subjoined Table by Prof. Morris, will serve to show the relative classification of the Lower Palæozoic Rocks according to

SEDGWICK (1872) and MURCHISON (1868).	
SILURIAN.	Ledbury Shales, Downton Sandstone, Bone Bed and Upper Ludlow.....
	Aymestry Limestone and .....
	Lower Ludlow .....
	Wenlock Group .....
	Lower Wenlock Group ....
CAMBRIAN.	May Hill Group .....
	Upper { Upper Bala Group ....
	{ Middle Bala Group ....
	{ Lower Bala Group ....
	Arenig or Skiddaw Group
CAMBRIAN.	Mid. { Tremadoc Group .....
	{ Ffestiniog Group .....
	Menevian Group .....
CAMBRIAN.	Lower { Harlech Group .....
	{ Longmynd, Bangor.....
and Llanberis Group...	
PRIMORDIALSILURIAN	
CAMBRIAN.	

The divisions adopted by Prof. Phillips (1855), by Prof. Jukes (1863), by the Survey (1863), by Sir Charles Lyell (1871), are also given by Prof. Morris. Each differs somewhat from the above in the greater divisions. Lyell makes the barrier between the Cambrian and Silurian at the top of the Tremadoc Group; Phillips, between the Arenig Group and the Llandeilo Flags, which is also the line of division adopted by the Geological Survey, although the beds are called by different names and their synonymy is not readily to be made out. Jukes calls the Middle and Upper Cambrian of Sedgwick "Lower or Cambro-Silurian."

One thing is very clear, that Murchison—although not justified by good evidences of unconformity in the strata and of a break in time and in the succession of the rocks, and a change in conditions, both lithological and palæontological—carried the day with the public, stealing a march on his old friend's boundary-line; at first, as Sedgwick intimates, by issuing a small map in the atlas published by the Society for the Diffusion of Useful

Knowledge (in 1843), "in which he (Murchison) had brushed out of sight, under a deep Silurian colour, every trace of my previous work in North Wales" (p. xxvi), and afterwards by a bold assumption of right of priority, which he ever after maintained. Of his treatment by the council of the Geological Society—(then, it is to be feared, entirely led by Murchison and completely under his control)—Sedgwick cannot evidently bring himself to speak in any measured terms. Writing of the way in which his papers were tampered with by Mr. Warburton, who totally refused him the sight of any single proof-sheet, though he applied to him again and again with increased energy after his repeated refusals, he says:—"It is no easy matter to explain an overbearing treatment such as I have described; but I believe Mr. Warburton undertook his task for the express purpose of bringing my papers into harmony with Murchison's scheme of covering all the older rocks of North and South Wales with Silurian colours. For in his Reduction (of *Sedgwick's* maps and sections) he again and again contrived to *change my language, and make me write in a new Silurian tongue*. Was this fair and honest dealing with me?" (p. xxvii.)

All through his life Sedgwick retained much of the honest, frank simplicity of manner so characteristic of the hardy dalesmen of his native county. There was a singular blending of almost womanly tenderness and affection in his nature, with a stern, uncompromising love of truth, and a healthy and hearty aversion for whatever was unjust or mean.

Thus, whilst he keenly regretted to the last his loss of Murchison's friendship—more so perhaps even than the usurpation by another of the labours of so many years of good, sound, honest geological work—yet he could never recover from the sense of unfair treatment which he felt he had so little merited either from his friend Sir Roderick or from the Geological Society; and it painfully influenced his later years, causing him to hold aloof from the geological world outside his University.

One curious and very striking result presents itself to our minds in studying Prof. Morris's summary of life-forms—namely, how very far, after all, our earliest palæozoic records must be from reaching back to that dim and distant period when life began on our earth.

It is true there is a marked difference in the relative proportions of genera even between the Cambrian and Silurian epochs, and again between the Upper and Lower Cambrian; but roughly speaking—besides plant-remains—we have representatives of *six great groups* of Invertebrata even in the Cambrian rocks. The following will show the relative number of genera in the two divisions:—

	Cambrian.	Silurian.
Plants.....	1	4
Protozoa.....	7	7
Hydrozoa.....	11	2
Actinozoa.....	9	24
Echinodermata.....	4	26
Annelida.....	13	7
Crustacea.....	40	21
Bryozoa.....	2	6
Brachiopoda.....	17	19
Lamellibranchiata.....	8	19
Gasteropoda.....	9	13
Heteropoda.....	2	1
Pteropoda.....	5	4
Cephalopoda.....	4	6

It is only when we reach the Downton sandstone and the Ledbury shales, the uppermost Silurian strata, that we meet with any evidence of the first known fishes *Onchus* and *Pteraspis*.

In the one group, that of the Crustacea, which appears to

be richer in genera in the Cambrian than in the Silurian, this results, in great measure, no doubt, from the recent large accessions of new genera peculiar to older rocks of late determined by Messrs. Salter and Hicks, some of which, however, may prove not to be distinct when better materials are obtained.

The Crustacea and the Cephalopoda doubtless occupied the highest places in the animal kingdom in these early times, and their functions were as important in the Cambrian and Silurian periods as that of the Fishes and Reptilia among the vertebrata of later periods and at the present day. They were the redacious types of animals whose office it was to devour not only the dead and dying, but also the surplus progeny of the palæozoic seas—a task which, from their abundance and the large size of some of their number, they were doubtless well able to perform.

Altogether the *Catalogue* enumerates about 910 named species, but many other forms are noticed, together with their localities, to which specific names are not assigned.

Much remains to be accomplished before it is possible to generalize with any degree of certainty upon this interesting question of the earliest appearance of each zoological group in time. But every such catalogue as the one before us is a step in the right direction, and our best thanks are due to the Syndics of the University Press, and especially to the Vice-Chancellor, Dr. Cookson, for the excellent manner in which it has been brought out.

HENRY WOODWARD.

## Notes on Scientific Work.

### Geology.

**Fossils from the Phosphate Beds of Quercy.**—M. P. Gervais communicates to the French Academy of Sciences (*Comptes Rendus*, vol. 77, p. 106) some notes on the fossil remains from the phosphate beds of Quercy, which he has met with in his examination of various collections made in that locality. That of M. Daudibertiére, remarkable for the number and good preservation of its specimens, contains some fine examples of *Palæotherium* analogous to those occurring in the Paris gypsum beds, and some remains of *Rhinoceros minutus* and *Acerotherium*. There are also some teeth of a mammal related to *Rhinoceros*, but differing from that genus in some essential characters. M. Gervais therefore proposes a new genus for its reception which he designates *Cadurcotherium*, and the species *Cad. Cayluxi*, from Caylux whence it was obtained; the animal was of greater height than *Rhinoceros* or *Acerotherium*. The teeth consist of the last upper molar and several lower molars; the upper being larger and narrower than that of rhinoceros. Its external face is slightly convex and the hollowing of its crown is narrow and elongated. The lower molars are smaller than in *Rhinoceros*, with collines much more oblique and less projecting; their external face is undivided and has but a slight curvature. The porcine remains from these beds consist of *Anthracootherium*, *Entelodon*, *Hyootherium*, *Cainotherium*, and a small animal allied to the latter, which possesses a well marked bar between the first and second false upper molars. The ruminants consist of *Amphitragulus* and a species of *Cervus*. There are many species of *Ilyenodon*, also *Cricetodon* and *Archæomys*, whilst *Peratherium*, *Aves*, terrestrial *Chelonians*, a species of *Crocodyle*, *Laertians*, and Serpents are all represented.

**The Corundum of North Carolina and Georgia.**—Dr. Lawrence Smith, who discovered emery at Gumuch-dagh, near Ephesus, and in the Grecian Archipelago in 1846-7, gives some particulars (*Comptes Rendus*, vol. 77, p. 356) of the mode of occurrence of that which has been found in great abundance during the last few years in North Carolina and Georgia. The corundum occurs in serpentine or a chrysolite rock constituting a system of veins extending over a distance of 190 miles. This system is developed on the north-west side of the Blue Mountains, and runs parallel to the principal chain at a mean distance of about ten miles from the summit, describing however a very considerable curve inwards near the source of the Little Tennessee river. For a distance of about 130 miles, extending from Mitchell Co. to Macon Co., the serpentine veins are enclosed in a hard crystalline gneiss which contains red garnet, kyanite, and pyrites. From the bend at Little Tennessee river it passes into a hornblende gneiss. At Buck's Creek and thence towards the south-west the orthoclase felspar of this rock is replaced by albite, forming an albitic syenite. With the serpentine are found chalcodony, talc, steatite, anthophyllite, tourmaline, emerylite, zoisite, albite, asbestos, actinolite, tremolite, and sometimes chromite and epidote, the corundum

being mostly associated with ripidolite (clinochlore), with the exception of the red variety which occurs in the zoisite. This serpentine or chrysotile rock is invariably the gangue of the corundum in N. Carolina and Georgia, whilst in Asia Minor the enclosing rock is crystalline limestone. Dr. L. Smith points out however that although each locality possesses its own peculiar characters the contiguous rocks in each case are of the same geological age, and are both geologically identical with those found associated with the emery of Chester, Massachusetts.

**The Tertiary Deposits of Southern Italy.**—T. Fuchs describes (*Sitzungsberichte der Akad. der Wiss., Wien*, vol. 66 (1), p. 7) the results of his studies of the tertiary formation in the vicinity of Messina and Gerace in Southern Italy, which have been dealt with in numerous papers and memoirs by Prof. Seguenza and others. The author's attention was chiefly directed to the beds named by Prof. Seguenza the "Zancleén" and "Astien," the former including the white marl and coral limestone, the latter embracing the br ozoa limestone and a fine yellow sand. Fuchs' examination of these divisions leads him to the view that the "Zancleén" is not a distinctive deposit holding an intermediate position between the miocene and pliocene as regarded by Seguenza, but is true pliocene, and that both the "Astien" and "Zancleén" belong to the same geological epoch. He points out that the white marl which is often interbedded with the coral limestone is a deep sea deposit, as shown by the fossils it contains, the great bulk of these consisting of foraminifera such as *Globigerina* and *Orbulina*. These are present in such numbers that the rock might well be regarded as having at one time been *Globigerina* or *Orbulina* mud. It is in fact as typical a deep water deposit as the white chalk to which it bears a great petrographic resemblance. On the other hand the bryozoa limestone is rich in Balani, Pectens, Echinidae, and other well-known shallow water forms. Fuchs believes these two divisions to be of contemporaneous origin, and in fact to be but the same deposit under different conditions, the "Astien" being the strand formation, and the "Zancleén" the deep sea deposit.

#### Physiology.

**Vaso-motor Action of the Lingual and Hypoglossal Nerves.**—Prof. Vulpian in a paper read before the *Société de Biologie* states that hyperæmia and dilatation of the vessels occur after section either of the lingual of the fifth or of the hypoglossal nerve on the same side of the tongue; the venous blood at the same time becomes of a bright red colour. During electrical excitation of the peripheric extremity of the hypoglossal nerve, the hyperæmia diminishes and the corresponding half of the tongue becomes pale, but electrical excitation of the peripheric extremity of the fifth increases all the appearances of hyperæmia. Thus it would appear that both nerves contain nerves capable of causing dilatation and contraction of vessels: in the hypoglossal nerve the latter preponderate and in the lingualis the former. M. Vulpian has also made some experiments in regard to the splanchnic nerve and finds that if in curarized dogs the splanchnic nerve be divided three centim. above the left suprarenal-body the size and blood contents of the corresponding kidney are increased. The quantity of urine secreted is augmented; it becomes albuminous, but contains no epithelial cells of the tubuli or blood. On exciting the peripheric extremity of the nerves with induced electrical currents the kidney becomes pale, the veins contract, and the secretion ceases.

**The Functions of the Eustachian Tube.**—An essay on this subject has been published by Dr. T. F. Rumbold, of St. Louis, and a good résumé of the whole work is given in the *London Medical Record*, July 23rd, 1873. Dr. Rumbold endeavours to show: 1. That during the act of deglutition the eustachian tube is not an open passage into the tympanum. 2. That the walls of the eustachian tube are constantly in slight contact. 3. That the air continually permeates the eustachian tube into the tympanum, thus maintaining the normal air density in this cavity. 4. That the air in the normal tympanic cavity is not of equal density with that of the surrounding atmosphere, the air in the tympanum being rarefied. 5. That one of the functions of the eustachian tube is the maintenance of this normal air density. 6. That the rarefied condition of the air in the tympanum is the cause of the uniform concavity of the membrana tympani, especially that portion of it from which the "light spot" is reflected.

**Elimination of Salts of Mercury in Man.**—M. Byasson has performed a series of highly interesting experiments in order to determine the time it takes for a soluble mercurial salt introduced into the stomach to be detected in the urine, saliva, and sweat, and has communicated his results to Robin's *Journal d'Anatomie et de Physiologie*. He finds: 1. That mercuric bichloride taken into the stomach may be found in the urine about two hours after its ingestion. 2. It takes four hours to be found in the saliva. 3. It is not possible to detect its presence in the sweat. 4. Twenty-four hours after the ingestion of moderate doses of the salt its elimination may be considered to be achieved. 5. A part of it is to be found in the fecal matter.

**The Peristaltic Movements of the Intestines.**—J. P. Hougkeest van Braam (*Pflüger's Archiv*, 1873, H. vi.) has adopted Sander's method of observing the peristaltic movements of the intestines, which

consists in plunging the animal in a solution of 6-10ths per cent. of common salt at the temperature of the body and opening the abdomen beneath the surface. He has arrived at the conclusion that the pneumogastric nerve is the motor nerve of the stomach but can call forth no movements in the small intestine. Where movements of the intestine appear to have been caused by excitation of the vagus it is due, he believes, to the propulsion of part of the contents of the stomach into the intestine. The vagus has no influence upon the large intestine nor upon the uterus. The splanchnic nerves are the vaso-motor nerves of the intestine, and they constitute at the same time inhibitory nerves for the intestinal movements and for the movements of the stomach. The movements of the intestine are in a higher degree dependent on the nature of the blood and the fullness of the blood-vessels. Under normal conditions local excitations are not propagated from one point to another and cause no peristaltic movements. Antiperistaltic movements never occur under normal conditions.

**On the Pressure in the Pericardium.**—Dr. Adam Kiewicz and H. Jacobson observe (*Centralblatt*, 1873, No. 31) that the pressure on the external surface of the heart has never yet been measured. Carson and Donders admit that it is equal to the pressure in the pleural cavity, which last they attempted without much success to estimate indirectly. Drs. K. and J. introduced a trocar through the fourth intercostal space having a tightly fitting stilet, which was then withdrawn to a point beyond that at which a manometer was connected with the interior of the canula. The withdrawal of the stilet of course left a vacuum, but that was allowed for in accordance with the result of previous experiments. They found that the pressure on the surface of the heart was always negative in sheep, dogs, and rabbits. The amount of negative pressure varied from  $-3$  to  $-5$  mm. of mercury. Hence it appears that the force with which venous blood is sucked towards the heart is considerably less than has generally been admitted. Donders estimates it in the pause of respiration at  $7\frac{1}{2}$  mm. of mercury, after an ordinary inspiration at about 9, and with a very deep inspiration at 30 mm. The authors in their experiments find it to be about one half the above numbers.

**The Life History of a Cercomonad.**—In the last part of the *Monthly Microscopical Review* (lvi.) Mr. Dallingier and Dr. Drysdale give interesting details of some protracted observations they have recently conducted on a cercomonad, and which have an important bearing on the controversy respecting spontaneous generation. They used various microscopic powers and continuously examined during sometimes as long a period as fourteen days a peculiar monad, hitherto undescribed, but which is under some circumstances developed in enormous quantities in the fluid resulting from the maceration of the head of the cod. This form passes through a remarkable series of changes, each of which might be taken for a distinct and independent creation were not its evolution perfectly regular. Whilst working on this they observed a second form which possessed only one flagellum instead of two. When mature of this form multiplies by fission for a period extending from two to eight days it becomes peculiarly ameboid, two individuals coalesce, slowly increase in size and become a tightly distended cyst. The cyst bursts, and incalculable hosts of immeasurably small sporules are poured out as if in a viscid fluid and densely packed; these are scattered, slowly enlarge, acquire flagella, become active, attain rapidly the parent form, and once more increase by fission. Experiments were next made to determine the influence of heat. An ordinary slide containing adult forms and sporules covered in the ordinary way was in seven several cases allowed to evaporate slowly and placed in a dry heat which was raised to  $121^{\circ}\text{C}$  ( $250^{\circ}\text{F}$ ). It was then slowly cooled and distilled water was taken up by capillary attraction. On examination all the adult forms were absolutely destroyed and no spore could be definitely identified. After being kept moist in the growing stage for some hours and watched with the 1-50th gelatinous points were seen in two out of the seven cases, which were recognised as exactly like an early stage of the developing sporule, and by careful watching these were observed to attain the small flagellate state.

## History.

**Councils and Ecclesiastical Documents relating to Great Britain and Ireland.** Edited, after Spelman and Wilkins, by A. W. Haddan and W. Stubbs. Vol. 2, part 1. Clarendon Press.

THIS volume completes the account of the Celtic churches in Great Britain, Ireland being reserved for the second part. It contains all that is known about the church of Cumbria or Strathclyde (A.D. 600-1188); the British churches abroad, viz. in Armorica (387-818) and at Bretoña in Galicia (569-830); and the church of Scotland until declared independent of the see of York (400-1188).

The Celtic church suffered a destiny as hard as that of the Celtic State. Their missionaries converted Scotland, and North and Central England, only to see the result of their labours appropriated by the ever encroaching power of Rome. Their missions to the continent shared a nearly similar fate. The Papacy gave Scotland to the see of York, Wales to that of Canterbury, Brittany to that of Tours; a stroke of the pen handed over Ireland to the Anglo-Norman church. The Scoto-Irish schools had trained a series of great men, and able scholars such as John Scotus Erigena, men who had the widest intellectual range during those ages: but the Danish invasions destroyed these schools, and with them the very means of future instruction. An element of intellectual activity which might have been of the greatest importance was thus lost to the Western world; and an independent organization destroyed which might have held its own against the growing autocracy of Rome. A large part of the materials for its history has consequently perished,

though the Celtic MSS. of S. Gallen and other monasteries abroad are still of the greatest value.

The pressure of the English and Norman races on the Celts not only displaced their tribes but their traditions, and the history of their saints has consequently been in some cases as it were relocalised. As the population was forced on into Wales and Cornwall, a series of emigrations naturally took place to the coast of Armorica, which thus got the name of Brittany. These tribes had always lent a helping hand to each other across the Channel; Cæsar found that the Veneti were strongly reinforced by their British allies from the opposite shore. Following the earlier colony (that of Maximus' soldiers in 387), fresh emigrants passed over in 450 and 512 and 561, all of them Christian Britons—though we have traces of paganism still in Cornwall and at Vannes and Leon. It is possible that the great calamities they suffered from the Anglo-Saxons and from pestilence may have impressed many others as well as Gildas, who has left us his Lament "De Excidio Britanniae," and who was himself one of the emigrants. At any rate there seems to have been a revival of religious feeling after the disastrous war. S. David reorganised discipline in Wales, and S. Samson and S. Paul (S. Pol de Leon) came from Cornwall to Dol and Leon respectively to preach to the emigrants. Not only were the local names Cornugallia and Domnonia transferred, but there is a considerable correspondence of names of all kinds on the two coasts, S. Briec, S. Budoc, Landevenech, and the like. In fact the intercourse between South Wales, Cornwall, and Brittany must have been very close throughout the sixth century. Oudoceus son of Budic came from Cornwall to Armorica to be prince of that country. And the Litany printed at p. 81, probably of the tenth century, might just as well be Cornish as Breton, if we look at the names of the saints commemorated in it (very different from the Scotch list in p. 279), Samson, Brioc, Melorus (Cornish, not Breton), Guinwaloe, Corentinus, Paul, Guoidwale, &c.—especially as it prays for the "plebs et clerus Anglorum" as well as for "rex et episcopus," since the Cornish, as well as the Breton church, was now leaning for protection on the Anglo-Saxon kings, as we see from the "Bodmin Gospels" in the British Museum. The wild shores of Cornwall were a favourite resort of the Welsh and Irish devotees, though the wildness which attracted them had no charm for the Anglo-Saxons, as we see by the complaint of Aldhelm's pupil Æthelwald (writing before 706, Jaffé 3, 38):

"Sicut pridem pepigeram—quando profectus fueram  
Usque diram Domnoniam—per carentem Cornubiam  
Florulentis cespitibus—et foccundis graminibus."

Perhaps Æthelwald was taking Aldhelm's letter to Gerontius, written to persuade the Celtic church to adopt the Roman date of celebrating Easter. The variance had only arisen from a different mode of calculating the right time, and the wonder rather is that any agreement could be ultimately come to at all than that there should have been disputes. On the other question, that of the tonsure, Aldhelm of course quotes the great religious romance of the Clementines, which the ecclesiastics had adopted from a most heretical source. How late the devotees persisted in betaking themselves to the desolate Cornish shores is clear from the Anglo-Saxon Chronicle a. 892, where mention is made of three Scots drifting in a boat from Ireland to Cornwall for the love of the pilgrimage. The somewhat restless activity of the Celtic missionaries is noted by Gildas, "transnavigare maria terrasque spatiosas transmeare non tam piget [Britannos sacerdotes] quam delectat;" and there was then no difficulty of language, for Giraldus Cambrensis notes as late as A.D. 1215 that the Cornish and Bretons spoke nearly the same tongue, intelligible to most of the Welsh also—except perhaps in

the north. Our editors have noted yet another British church abroad, at Bretoña in Galicia, but it was destroyed by the Moors. There has been always a sort of connexion between North Spain and the Celts of Great Britain and Ireland, and Spain had acknowledged the British Emperor Constantine (as it had Maximus before him); and Constantine had put his son Constans in possession of the country. The run across from Corunna to Falmouth is very easy and was the favourite passage for ambassadors in the Middle Ages; Cæsar already notices that "one side of Britain looks towards Spain" (v. 12), and Milton summing up a mediæval legend speaks of S. Michael's Mount,

"Where the great Vision of the guarded Mount  
Looks towards Namancos and Bayona's hold."

In fact we must practically regard all these Celtic districts as for a considerable period almost forming one body or confederacy, linked very closely by their ecclesiastical usages, which they were maintaining in conscious opposition to Rome; and in possession of nearly the same poetic traditions and legends (Paulin Paris derives even Nennius from Brittany). In Brittany, though there had been an early connexion with S. Martin of Tours, the Apostle of Gaul (he was similarly revered in Cornwall and Wales), yet the Roman see of Tours, as organized under the Frankish rule, endeavoured for a long time in vain to establish a supremacy over Dol. The missionaries from Tours evidently could not penetrate the forest of Brékilien, and their Christianising efforts were practically confined to the dioceses of Rennes and Nantes, and probably the south of Vannes. But the British emigrants had planted the whole coast, and even penetrated into the heart of the forest at S. Méen; a story in Hoveden ii. 136 shows a kind of connection still between this monastery and that of Bodmin in Cornwall as late as 1177. Ultimately of course the steady pressure of the Papal and French powers won the day, and Dol and Brittany equally lost their independence. The struggle is curiously like that of S. David's against Canterbury, as told in Giraldus Cambrensis, who fought it out in his own person. The diocese of Whitherne (Candida Casa) in Strathclyde similarly had to submit, and Iona lost its hold over Scotland.

The latter part of the volume contains a critically sifted account of the break up of the great kingdom of Northumbria, part of which fell to Scotland and part to England. Hence of course arose claims and counter-claims in endless variety, and our antiquaries still fight out an internecine war on the subject. The archbishopric of York has not had a successful history. Pope Gregory meant it and London to have shared the island between them equally, York having all up to the very north of Scotland. But Canterbury rose in importance with the rise of the southern capital, and the Scottish kings naturally wished to have their church independent of all English influence, and ultimately succeeded in their purpose. The Lothians had once been purely English, and even Fordun describes Stirling as a "*locus marchialis, Scotiam et Britanniam intermediis sive connectens*," and the bridge there over the Forth as "*inter Britanniam et Scotiam, utriusque marginem apprehendens*." But York in vain made efforts to keep up lines of bishops in the Orkneys and at Whitherne and at Glasgow; the Popes ultimately declared the Scottish bishoprics dependent on no one, save immediately on the Apostolic See. When the kingdom became independent, it was impossible to keep the national church dependent on England; the question no longer rested on disputed documents. The early history of the church of Scotland during the Celtic period is treated with great care, but in Pictish history a probable guess is all that is possible. The Irish Scots were already Christians when they settled in

Argyllshire, and S. Columba and his missionaries from Iona evangelized the northern Picts as vigorously and successfully as their successors did the people of Northumbria, and Mercia and Essex. The account of the Culdees in appendix B is admirably done, the ground having been once for all cleared by Dr. Reeves. These foundations, perhaps beginning about 800, in time followed a like course of deterioration with the similar Irish and with the Celtic Welsh monasteries; and partly by their own decadence, but perhaps more through English ecclesiastical influence (which began with Malcolm and Margaret, and culminated under King David), they, with the other monasteries of an Irish type, were either transformed or destroyed by a revolution beginning about the middle of the twelfth century, being principally converted into the monastic order nearest akin to them, viz. Augustinian canons; by the middle of the fourteenth century they had disappeared altogether, even in name. The old view of them may be seen in its best form in Campbell's poem of Aodh and Reullura. Nearly all the Scotch missionaries on the continent came from Ireland, the only one perhaps from Scotland itself being S. Cadroe, Abbot of Metz, who died about 978.

Among the collections printed in this volume some of the most curious are the Canons of Adamnan (p. 111), which mostly relate to unclean meats, and afford a valuable specimen of the way in which the early missionaries tried to adopt certain Biblical precepts to a barbarous mode of life. The first one runs thus:—"Marina animalia ad littora cadentia, quorum mortes nescimus, sumenda sunt sana fide, nisi sint putrida." In p. 119 is the Rule of S. Columba (probably compiled after his death), which is very striking. Part of it seems to be arranged by threes, e.g. "Take not of food till thou art hungry, Sleep not till thou feellest desire, Speak not except on business."

This first part of the second volume has been published separately, as the death of the lamented editor, Mr. Haddan, by which the whole church of England suffers a severe loss, has prevented the completion of the part relating to Ireland. But the work already done has been done once for all; the early evidence will not need another such critical and conscientious examination as Mr. Haddan has devoted to the records of the early Celtic churches of Great Britain.

C. W. BOASE.

### Intelligence.

It is known that the victor in one or more of the principal contests at Olympia was entitled to have a statue erected there in his honour at his own expense or at that of his friends or townsmen. In the case of a victory in the horse or chariot races, the memorial would of course take the form of a chariot group or an equestrian figure. To maintain the local pride in a success of this kind, whether at Olympia or at any of the other national Greek games, various measures were taken, and among them that of striking a coin bearing an obvious illustration of the event, as is attested by the two instances of Anaxilaos, the tyrant of Rhegium, and Philip of Macedon, the father of Alexander the Great. This method of commemorating a victory at the national games has been lately brought into prominence by a paper *On the coins of Kamarina*, in Sicily, contributed to the *Transactions of the Royal Society of Literature*, N.S., x., Pt. iii., by Mr. R. S. Poole, the Keeper of Coins and Medals in the British Museum. After showing, without room for doubt, that the coins of Kamarina with the figure of a quadriga driven by Pallas, towards whom a Nike reaches a wreath, must have been struck at the time when Psaumis of that town gained the chariot victory celebrated by Pindar in the fourth Olympian Ode, Mr. Poole proceeds to compare the other coins of Sicily, on which agonistic types occur, with the recorded facts as to victories gained by citizens or rulers of these towns. The result is full of interest, and may be taken as opening up a question the pursuit of which must be largely to the advantage of the history of Greek art. Another question of the same class, the comparison of types on coins with the existing descriptions of celebrated statues, deserves more attention than appears to have been bestowed on it hitherto by numismatists. Meantime it may be worth while to point out that Alcibiades

is said to have commemorated his victories at the national games by two paintings, in one of which he was represented in the act of being crowned by Olympia and Pythia, not it should be observed by Nike. With this analogy it is possible to conceive that the winged female figure represented on the Sicilian coins as in the act of reaching a crown towards the charioteer, may be a personification of Olympia or one of the other localities where national games were held. As regards the amphorae on the coins of Kamarina, it may be, as Mr. Poole suggests, that such vessels filled with sacred oil were given as rewards to the victors. This was the case at the Panathenaic games, but as yet we have no evidence of such a proceeding at Olympia. At the same time, and in the absence of proof to the contrary, it is quite possible that second and third prizes consisted of substantial rewards of this kind.

At the annual meeting of the British Archaeological Institute, lately held at Exeter, Dr. E. A. Freeman read a valuable paper on "The Place of Exeter in English History," which was reported in several journals. We take our account of it from *Nature*, Aug. 7. Dr. Freeman had already sketched the history of the place in the fourth volume of his *Norman Conquest*; he now traced its growth from an original Celtic hill-fort into a Roman city, which had lived on through the Teutonic Conquest, and which still, after all changes, kept its place as the undoubted head of its own district. In Wessex such a history is unique; the continuity of its being is more perfect than that of most of the cities of Northern Gaul. He said that he could not answer his own first question, "When did the Celtic and Roman city first become a West-Saxon possession?" The first undoubted mention of it was in the days of Alfred, but it did not become wholly English in blood and speech until two centuries later. In Athelstan's day the city was still partly Welsh, partly English, each forming a city within a city. Athelstan drove out the British inhabitants and fortified the place by a wall. Dr. Freeman then traced the course of events through the Danish and Norman times. By the Norman Conquest it was settled for Exeter that she was to be an English city, not a separate commonwealth like the independent cities of Germany.

The view that Exeter, and Devonshire in general, were mainly Celtic until Athelstan's time has since been controverted in the *Pall Mall Gazette* by a writer who thinks little stress can be laid on the somewhat late account of Athelstan's proceedings given by William of Malmesbury, and that Devonshire became English much earlier. There are some grounds for this view. The Cornish parishes still retain the names of Celtic saints; in Devonshire there are very few traces of Celtic names; the Tamar is the Celtic boundary. In fact the Celts of Cornwall (not of Devon) helped the Danes against the English, and Egbert's victory over them was at Hingston Down, west of the Tamar. Athelstan, who conquered Cornwall, is traditionally connected with the conventual foundations at S. Germans, Bodmin, and Burian. There is no need to deny that there was a Celtic quarter in Exeter in Athelstan's time. Some of the parishes still show Celtic names, e.g. S. Petrock, and in a paper read at the Institute Mr. Kerslake tried to ascertain what parts of the city were occupied by the Celts and Teutons respectively—Dr. Freeman said that Mr. Kerslake had cleared up some of his difficulties about the walls—a good instance of the way in which the historian and the local antiquary may help each other. There are other grounds also for thinking that the English occupied Devon at an early time. If the Adescanaster where S. Boniface received his education was Exeter, there must have been already an English monastery there. We trust that Dr. Freeman, having taken up this interesting subject, will now work it out in a thorough manner.

We have received an excellent number of the *Cape Monthly Magazine* (April, 1872), which shows that our people at Cape Town take an interest in old English history. It contains an article by Dr. W. H. I. Bleek on "The Graham MS. Chronicles of England." The Mr. Graham to whom the MS. belongs represents, we believe, the Grahams of Fintry. The history of the MS. itself would be valuable, and Mr. Graham should give it himself. The first part seems to be an abridged form of the well-known chronicle, the *Brut*; the latter contains a series of small treatises, the chief value of which consists in the full-length miniature portraits of the Conqueror and the ten following kings, painted in the middle of the fourteenth century. The portraits of Edward III., the Black Prince, and Richard II., by a contemporary hand, are most likely faithful likenesses. On fol. 47 is a document in Anglo-Saxon which would be worth copying. It is not improbable that the volume once belonged to James I., but we should like to know more of its history. Dr. Bleek has given a few lines from the beginning and end of each piece which will assist in their identification.

### Philology.

Original Sanskrit Texts on the Origin and History of the People of India, their Religion and Institutions. Collected, translated, and illustrated by J. Muir, D.C.L., LL.D., Ph.D. Vol. 4. Comparison of the Vedic with the later representations of the principal Indian Deities. Second Edition, revised. London: Trübner & Co. 1873.

A SUCCESSFUL elucidation of the history of the religious development of India would do more than anything else to advance our knowledge of the development of the religious impulse in mankind. On the one hand the Indian religion has roots reaching back to an extremely distant period; for, as is proved by the agreement of many essential elements of Vedic religion with corresponding ancient Greek, Italian, German, and Slavonic ones, the Vedas reflect, in the main, the religion of the Indo-Germanic race, as this had constituted itself before the separation of the different branches; that is to say, to a time long—at least some thousand years—prior to the beginning of our history. On the other hand, again, the Vedas form the groundwork of all the later religious formations of India, which, their variety notwithstanding, have all sprung from this original germ, and grown up independently without suffering any profound modification from foreign nations; so that in Indian religion we can trace the only really free development—nearly undisturbed for well nigh six thousand years—of the religious impulse amongst the Indo-Germans.

Besides this, in Indian literature an abundance of auxiliary facts have been preserved, which, if they do not suffice to explain the development exhaustively in all its aspects, at least throw light upon many sides of it. The external side of Indian religion, the mode and the objects of worship, is already known for many periods, and for others appears discoverable. The speculative and philosophical development which unfolds itself in connection with the religion receives countless illustrations from Indian literature. Our sources of information are scantier respecting the ethical fabric to which this served as foundation; but here too it is possible to draw more conclusions than might be expected

at first. As to the point of most importance for the right judging of a religion, that singular copy or off-print of the human mind, in which the highest product of the native human striving after ideal completeness, is made serviceable to deep and urgent practical necessities,—the way in which it works and lives in a whole people, how it elevates or debases them, ennobles or degrades, gives strength or weakness, refines or deadens the feelings; the class of feelings which it calls chiefly into play, the degree of depth, and intimate self-devotion which it may succeed in inspiring, in what relation the action of the religious stands to the critical spirit and to what extent it controls the latter or is limited, guided, and controlled by it;—these and similar questions may be determined with tolerable certainty for many periods, especially those beginning approximately with the present era. The Mahābhārata, the Purāṇas, the glorifications of particular holy places therewith connected, the didactic literature, religious poems, mystical writings, those concerning superstition, and others of the like kind, allow us to see further into the religious life of the Indians than, perhaps, into that of any other people. What is seen there is certainly by no means always agreeable, but one also finds, between whites, so much profound, intimate, and thoughtful tenderness that one is disposed to overlook many errors for the sake of the wonderfully deep and pure source whence they flowed at starting.

The work to which these remarks are devoted offers excellent assistance towards the attainment of exacter insight into a very essential part of this religion. It deals, indeed, only with a small number of Indian divinities; but those considered are such, especially Vishṇu and Śiva, as have long occupied the highest place in the Indian Olympus, and the manner in which they are discussed by the author is exactly calculated to furnish a secure foundation for the history of their development from the time of the Vedas to that of the Purāṇas.

The work is a second edition, enlarged in various ways; the first was gratefully utilized by all who were interested in India and the religious life of humanity, and all the praises accorded to it, in public and in private, are equally well deserved—in some cases even better deserved—by the present edition.

The work consists substantially of a collection of passages from Indian, especially from Vedic, writings which contribute to a knowledge of the nature and the historical development of the divinities therein treated. They are printed in the original, accompanied by a careful and excellent translation, in the preparation of which no valuable aids have been neglected. To these are subjoined explanatory considerations, which must always be read with great interest; even though it may be foreseen that additional materials and a more searching examination of those already known will cause them to undergo considerable modification.

THEODOR BENFEY.

**Hartel's Homeric Studies.** [*Homeric Studien: Beiträge zur homerischen Prosodie und Metrik.* Von Wilhelm Hartel.] Berlin. 1873.

THIS work is an example on a limited scale of the remarkable impulse which the modern Science of Language has given to Greek, and especially to Homeric studies. The notion which lies at the root of that science, of a gradual and perfectly continuous process of change going on in every language and forming its history, is eminently applicable to Greek, because there is no language of whose history we possess so complete a series of records. In Homer we have a specimen of Greek which takes us back a considerable way towards the period at which it parted from the cognate languages. Homer accordingly is the field on which the older Philology receives the greatest amount of help from the

modern "Science of Language." And this help extends to every part of Homeric criticism—the "higher" as well as the "lower." On the one hand the comparison of Sanscrit and other Indo-Germanic languages serves to explain and defend many grammatical and metrical peculiarities, and on the other hand it throws light on the relations of the Epic dialect as a whole, and therefore on all the questions of time and place which make up the Homeric controversy.

The present work (an octavo of 126 pages) deals with the irregular lengthening of short final syllables in the Homeric poems. It first appeared in the Transactions of the Vienna Academy, and was reviewed in an admirable paper by Dr. Georg Curtius, in the fourth volume of his *Studien zur Griechischen und Lateinischen Grammatik*. The present edition contains some fuller discussion of points on which Curtius had expressed his dissent.

The discovery of the Digamma, as Dr. Hartel points out, first gave scholars the hope of explaining the metrical difficulties of Homer, and thus of restoring an original smoothness to his text. Until then every irregularity was classed as a "poetical licence," due to the necessities or convenience of the versification. At first it was imagined that the Digamma would serve as a universal solvent; a "Digamma" was introduced wherever the metre called for the remedy. It was soon found however, with the advance of the Science of Language, that in a large number of cases the Digamma could not be introduced. Some scholars, in particular C. A. I. Hoffmann in the *Quaestiones Homericae*, and H. A. L. Ahrens, sought for other "lost consonants." Observing that short final vowels were often lengthened before liquids, they supposed the existence of combinations such as  $\sigma\mu$ ,  $\sigma\nu$ ,  $\gamma\upsilon$ ,  $\delta\nu$ ,  $\sigma\rho$ ,  $\sigma\lambda$ , of which the first consonant was afterwards lost. These double consonants, they thought, either were pronounced in the age of Homer, or had left as a trace of their former presence the tendency to double the initial liquid after a vowel. The success of this mode of explanation was considerable, but still only partial. In the case of the  $\rho$  the number of roots which can be shown to have originally begun with  $\rho\rho$  or  $\sigma\rho$  is so large that nearly every instance of a short vowel lengthened before initial  $\rho$  may be explained by position: and it may further be held that the instances of lengthening have been so numerous as to create a new general rule. In other words,  $\rho\acute{o}\varsigma$  was at first  $\sigma\rho\acute{o}\varsigma$ , and therefore  $\kappa\alpha\tau\grave{\alpha} \rho\acute{o}\nu$  was pronounced  $\kappa\alpha\tau\grave{\alpha} \sigma\rho\acute{o}\nu$ . When the  $\sigma$  was lost this might become  $\kappa\alpha\tau\grave{\alpha} \rho\rho\acute{o}\nu$ , just as in French we have *il parle*, but *parlet-il*. Finally, the number of instances like  $\kappa\alpha\tau\grave{\alpha} \rho\acute{o}\nu$  might create a habit of lengthening any vowel before initial  $\rho$ , as we find done in Attic. So far everything seems plain: but when Hoffmann and Ahrens proceeded to apply this method to the cases of short vowels lengthened before other liquids, especially  $\mu$  and  $\lambda$ , they were led to propose a number of untenable etymologies. The difference between  $\rho$  and  $\mu$  appears very strongly when the statistics are drawn out for each. Out of 126 lengthenings before  $\rho$  there are 85 which can be etymologically explained: out of 321 lengthenings before  $\mu$  there are only 11. It may be suggested that the loss of  $\sigma$  before  $\mu$  occurred earlier and left fewer traces than the loss of  $\rho$  and  $\sigma$  before  $\rho$ : but, on the contrary, the combination  $\sigma\mu$  is not very rare in later Greek, whereas  $\rho\rho$  and  $\sigma\rho$  became extinct.

Dr. Hartel, following Hoffmann, has drawn a careful distinction between the cases in which the cause of lengthening can be traced in the history of the final (short) syllable and those in which it seems to reside in the initial consonant following—between cases (to use the convenient German words) of old "Auslaut" and old "Anlaut." The most valuable part of his conclusions, according to Dr. Curtius, is that which relates to "Auslaut." The original length of the

of the Dat. Sing., of the  $\alpha$  of the Neut. Plur., and of many stems in  $\iota$  and  $\upsilon$  ( $\beta\lambda\omicron\sigma\upsilon\rho\acute{\omega}\pi\iota\varsigma$ ,  $\beta\rho\omega\tau\acute{\upsilon}\varsigma$ , &c.) seems made out. That the  $\alpha\upsilon$  and  $\omicron\upsilon$  of the 3 Plur. were pronounced  $\alpha\upsilon\upsilon$ ,  $\omicron\upsilon\upsilon$  (original  $\alpha\upsilon\tau$ ,  $\omicron\upsilon\tau$ ) seems very possible, but the instances are not numerous. On the influence of initial consonants on a preceding vowel there is less agreement. Dr. Hartel shows very happily that the lengthening cannot take place if there is any pause in the sense between the two words: in short that it depends on the words being run together in pronunciation. So far however Dr. Curtius is at one with him. The point at issue (if we have rightly understood the controversy) is this: Dr. Hartel regards the tendency to "doubling" as inherent in the nature of the liquids. It is not strictly a doubling, but a thickening or lengthening of the consonantal sound. This thickening he conceives is liable to be produced by the arsis or metrical stress, much as the doubling of consonants in Italian has been produced (*parlerotti* for *parlerò-ti*, &c.). Dr. Curtius clings to the etymological explanation, but he supplements it by other considerations deserving of the greatest attention. The influence of false analogy—custom which once was rational creating custom which is irrational—is always potent in the development of language. But the Homeric language, he shows, must be treated as a whole, and with regard to its peculiar character and history. It is impossible to believe that the dialect, as we find it in the poems, was spoken by a single people at any one time. It has all the characteristics of a poetical and conventional dialect, formed by the singers of many generations, in which new and old were blended in successive layers and in ever varying proportions. A large proportion of the poems is made up of traditional formulae which the author or authors (for in this point of view the question of authorship makes no difference) found ready made, and employed as the established materials of the art. But since the language was constantly changing, these formulae must have presented much that was obsolete, both in grammar and metre, when the poems were composed. These obsolete features then must have been felt partly as archaisms, partly as irregularities. In both characters they were likely to be imitated: for Greek literature in all periods shows the tendency to choose or form a *style*, a conventional artistic dialect suitable to each form of art. Thus in Dr. Curtius' words, "much seemed to be *licence* which in reality was *archaism*:" and the effect was not only that real archaisms gave birth to imitative pseudo-archaisms, but also that the original strict rules of the metre were materially loosened. This was especially the case from the loss of the Digamma. Originally, in all probability, the rules regarding Hiatus were strictly observed. Then came the loss of the Digamma, and not only created a number of cases of Hiatus, but created the impression that irregular Hiatus might be occasionally tolerated.

It would be impossible in a short space to do justice to the arguments of each side of this interesting controversy. One consideration on which Dr. Hartel lays considerable stress, may be noticed. He finds that in Hesiod and the Homeric Hymns the number of metrical irregularities of the kind in question is much smaller, and chiefly found in direct imitations or reminiscences of Homer. But, he argues, if there had been a tendency to create such irregularities by false analogy, we should have found them increase instead of diminishing as time went on. Dr. Curtius replies, and apparently with reason, that the period of Hesiod and the Hymns (700-500 B.C.) was one in which the original creative impulse of Epic poetry had virtually died out. Hence the metrical feeling was that of a later time, modified only where the older standards exercised a direct influence. Thus the exceptions were really of the same kind as those which were

occasionally introduced in imitation of the supposed "licence" of Homer by Apollonius Rhodius, or Virgil.

Dr. Hartel's book contains much that is suggestive on wider questions of metre and rhythm. His analysis of the rhythmical value of the punctuation, and his observations on the different force of the arsis in different parts of the verse, are especially valuable. Every scholar must join in the hope expressed by Dr. Curtius that the present book will be followed by at least one other discussing the Hiatus and the Digamma.

D. B. MONRO.

Knös on the Digamma in Homer. [*De Digammo Homericæ Quaestiones*. I. *Scriptit* Olaus Vilelmus Knös.] Upsala: Universitets Arsskrift. 1872.

THIS work (which reached us after the preceding article was written) does not offer so much novelty as that of Dr. Hartel, but possesses in a high degree the merits of care, judgment, and exhaustiveness. It consists of two parts. In the first (which is much the shorter) Dr. Knös examines the metre of Homer with the view of ascertaining the conditions under which the loss of a consonant may properly be inferred. A highly interesting parallel to the way in which such a consonant may be restored from metre alone is given by him from the old Scandinavian alliterative poetry. The manuscripts in many cases, it appears, give words beginning with  $r$  where the alliteration requires  $v$ , the reason being that when the poems were composed the same words began with the combination  $vr$ . A more complete analogy to the Homeric facts could hardly be imagined. In the second part Dr. Knös examines all the words in which a lost Digamma has ever been traced, and devotes separate chapters to the Palatal Spirant and to the combination  $\sigma f$ . As instances of judicious treatment of uncertain or contested matter the reader may look at his account of  $\epsilon\pi\omicron\varsigma$ , p. 86-88; of  $\iota\phi\iota$ , p. 127, where he rightly follows Bekker in making it a neut. adj., not an instrumental case; or of the distinct verbs  $\epsilon\rho\omega$  I draw and  $\epsilon\rho\upsilon\omicron\mu\alpha\iota$  I shelter. On the general question of the restoration of the Digamma to the text, and the impossibility of carrying out uniformity, he says simply and conclusively that if we must admit such doublets as  $\upsilon\varsigma$  and  $\sigma\upsilon\varsigma$ ,  $\pi\omicron\lambda\iota\varsigma$  and  $\pi\tau\omicron\lambda\iota\varsigma$ ,  $\kappa\acute{\iota}\delta\upsilon\mu\alpha\iota$  and  $\sigma\kappa\acute{\iota}\delta\upsilon\mu\alpha\iota$ ,  $\text{Ἀχιλλεύς}$  and  $\text{Ἀχιλεὺς}$ , with many more of the same kind, there can be no fatal objection to recognising such doublets as  $\acute{\alpha}\nu\alpha\chi$  and  $\text{Ἰάναξ}$ ,  $\omicron\iota\upsilon\omicron\varsigma$  and  $\text{Φοῖνός}$ . The addition of an index and table of contents would have been useful.

D. B. MONRO.

### Intelligence.

We are most glad to learn on the best authority that Dr. Strack, who is now at St. Petersburg, has obtained the consent of the Imperial Government to the photo-lithographic reproduction of a Hebrew MS. of the "later prophets," important not only from its antiquity (date A.D. 916), but from its being provided with the Assyrian-Babylonian accents and vowels. A description of the MS. will be found in Dr. Pinner's *Prospectus der der Odessäer Gesellschaft gehörenden Manuscripte* u. s. w., pp. 18-28, and in Dr. Strack's excellent little work, which we once again earnestly recommend to the student, *Prolegomena critica in vetus Testamentum Hebraicum*, p. 52. The number of copies will be limited to 250.

## British Association for the Advancement of SCIENCE,

22, Albemarle-street, London, W.

The NEXT ANNUAL GENERAL MEETING will be held at BRADFORD, commencing on WEDNESDAY, September 17.

President Designate—Professor A. W. WILLIAMSON, Ph.D., F.R.S., F.C.S., in the place of J. P. JOULE, D.C.L., LL.D., F.R.S., who has resigned the Presidency in consequence of ill-health.

NOTICE to CONTRIBUTORS of MEMOIRS.—Authors are reminded that, under an arrangement dating from 1871, the acceptance of Memoirs, and the days on which they are to be read, are now, as far as possible, determined by Organizing Committees for the several Sections before the beginning of the Meeting. It has therefore become necessary, in order to give an opportunity to the Committees of doing justice to the several communications, that each Author should prepare an Abstract of his Memoir, of a length suitable for insertion in the published Transactions of the Association, and that he should send it, together with the Original Memoir, by book-post, on or before September 1, addressed thus—"General Secretaries, British Association, 22, Albemarle-street, London, W. For Section....." If it should be inconvenient to the Author that his Paper should be read on any particular day, he is requested to send information thereof to the Secretaries in a separate note.

G. GRIFFITH, M.A., Assistant General Secretary, Harrow.

## Royal School of Mines.—Department of Science and Art.

During the Twenty-third Session, 1873-74, which will commence on the 1st of October, the following COURSES of LECTURES and PRACTICAL DEMONSTRATIONS will be given:—

1. Chemistry. By E. Frankland, Ph.D., F.R.S.
2. Metallurgy. By John Percy, M.D., F.R.S.
3. Natural History. By T. H. Huxley, LL.D., F.R.S.
4. Mineralogy. } By Warrington W. Smyth, M.A., F.R.S.,  
Chairman.
5. Mining. }
6. Geology. By A. C. Ramsay, LL.D., F.R.S.
7. Applied Mechanics. By T. M. Goodeve, M.A.
8. Physics. By Frederick Guthrie, Ph.D., F.R.S.
9. Mechanical Drawing. By Rev. J. H. Edgar, M.A.

The Fee for Students desirous of becoming Associates is £30 in one sum, on entrance, or two annual payments of £20, exclusive of the Laboratories.

Pupils are received in the Chemical Laboratory, under the direction of Dr. Frankland, and in the Metallurgical Laboratory, under the direction of Dr. Percy. These Laboratories will be re-opened on October 1st.

Tickets to separate Courses of Lectures are issued at £3 and £4 each.

Officers in the Queen's Service, Her Majesty's Consuls, Acting Mining Agents and Managers may obtain tickets at reduced prices.

Science Teachers are also admitted to the Lectures at reduced fees.

His Royal Highness the Prince of Wales grants Two Scholarships, and several others have also been established by Government.

For a Prospectus and information apply to the Registrar, Royal School of Mines, Jermyn-street, London, S.W.

TRENHAM REEKS, Registrar.

NOTE.—By order of the Lords of the Committee of Council on Education, the instruction in Chemistry, Physics, Applied Mechanics, and Natural History will be given in the New Buildings, in the Exhibition Road, South Kensington.

## University College, London. Session, 1873-74.

The SESSION of the FACULTY of MEDICINE will commence on Wednesday, October 1. INTRODUCTORY LECTURE at 3 P.M. by Dr. F. T. ROBERTS, B.Sc.

The SESSION of the FACULTY of ARTS and LAWS (including the Department of the Fine Arts) will begin on Thursday, October 2. INTRODUCTORY LECTURE at 3 P.M., by Professor O. HENRICI, Ph.D. INTRODUCTORY LECTURE for the DEPARTMENT of FINE ARTS, on Thursday, October 2, at 4.30 P.M., by Professor E. J. POYNTER, A.R.A.

The SESSION of the FACULTY of SCIENCE (including the Department of the Applied Sciences) will begin on Thursday, October 2.

The EVENING CLASSES for Classics, Modern Languages, Mathematics, and the Natural Sciences, will commence on Monday, October 6.

The SCHOOL for BOYS between the ages of Seven and Sixteen will RE-OPEN on Tuesday, September 23.

Prospectuses of the various Departments of the College, containing full information respecting Classes, Fees, Days and Hours of attendance, &c., and Copies of the Regulations relating to the Entrance and other Exhibitions, Scholarships, and Prizes open to Competition by Students of the several Faculties, may be obtained at the Office of the College.

The Examination for the Medical Entrance Exhibitions, and also that for the Andrews Entrance Prizes (Faculties of Arts and Laws, and of Science), will be held at the College on the 25th and 26th of September.

The College is close to the Gower-street Station of the Metropolitan Railway, and only a few minutes' walk from the Termini of the North-Western, Midland, and Great Northern Railways.

JOHN ROBSON, B.A.,

August, 1873.

Secretary to the Council.

## Junior Assistant for Photographic and Spectroscopic Observations in the Royal Observatory, Greenwich.

An open competition for one situation will be held in London, on Tuesday, September 30th, and following days.

A preliminary examination will be held in London, Edinburgh, and Dublin, on Tuesday, September 16th.

Limits of age, 18 and 25. Application for the regulations and the necessary form should be made at once to the Secretary, Civil Service Commission, Cannon Row, London, S.W.

### General Literature.

**The Songs of the Russian People**, as illustrative of Slavonic Mythology and Russian Social Life. By W. R. S. Ralston, M.A., of the British Museum, author of "Krilof and his Fables." Second edition. London: Ellis & Green. 1872.

**Russian Folk Tales.** By W. R. S. Ralston, M.A., of the British Museum, Corresponding Member of the Imperial Geographical Society of Russia, &c. London: Smith, Elder & Co. 1873.

It may seem superfluous to speak now of a work which, like the first of those above named, appeared some time ago and has already reached a second edition, a fact which sufficiently proves it to have been favourably received by the public. Nevertheless I am tempted to take this occasion of recurring to it *apropos* of the author's second work, which is also a continuation of the first, as I wish to consider them both, not from the general point of view, but as bearing more particularly upon the history of culture in the narrower sense. The former aspect, no doubt, is in some ways the most attractive, for every reader must be interested to know the kind and manner after which the Russian people expresses its feelings and sentiments amid the various vicissitudes of life in songs and tales, and how these reflect its modes of life and thought; especially as Ralston has executed his work with great skillfulness, selecting the most important and most attractive elements out of the abundant material before him. Yet the other side, which I propose to consider in the following lines, is scarcely, if at all, inferior in interest, especially as illustrating the outward and the secret relationship of certain customs, usages, superstitions, and ideas of the Russians with those of other peoples, a relationship which often extends much further than is apparent at the first glance. Thus Ralston remarks at starting (p. 11) about certain songs which ought to be described rather amongst the games than amongst the poems: "Therefore we will not dwell upon them at present; but there are a few others in which historical allusions occur, and which therefore seem to deserve special attention. Such for instance are the 'Titmouse' and the 'Oak Bench.' The subject of the first is marriage. The Bullfinch, after many unsuccessful attempts, determines to get married, so his sister, the Titmouse, invites the birds to her dwelling, in order that he may choose a spouse. The person who represents the Bullfinch wanders

about inside the Khorovod (choral dance) seeking for his bride among its members, &c. . . . This song is said to have been written during the reign of Ivan the Terrible (A.D. 1533-1584), but to have been prohibited for a time, on account of its containing allusions to the life of a certain influential Boyar." Nothing of the kind, however, is the case, and the Russian *savants* who have attempted to discover historical allusions here are in error; for such songs about the wedding of birds and other animals are met with also amongst other nations, as, for instance, the marriage of the blackbird and the thrush (*Mittler Deutsche Volkslieder*, Frankft. am Main, 1865, No. 559, 561), of the chaffinch and the nightingale (No. 560), of the cock and the hen (No. 562), of the lark and the chaffinch (Puymaigre, *Chants populaires du pays messin*, Metz et Paris, 1865, pp. 309-12; also found in Cambrésis and in Provence), of the cockchafer and the fly (*Mittler*, No. 608-9), of the horse fly and the common fly (Nyerup, *Udvalg af Danske Viser*, Kjöbenh., 1821, ii. 104), of the grasshopper and the ant (Widter, *Lieder aus Venetien*, Wien, 1864, No. 102a; Ferraro, *Canti popol. monferrini*, Torino-Firenze, 1870, No. 97, 100), of mice and weasels (Passow, *Тружёнства Ромашка* Lips 1860, No. 623), &c., see also Uhland *Schriften* 3, 75 seq.). The fundamental idea of these songs probably dates from a time when the animal world was much nearer to mankind than now, and men transferred to it their own ideas and habits of life, though as they are nearly all of a humorous character, they must belong in their present form to a somewhat later period. Cf. Uhland l.c. 52-179. Like the above-named song, the *Posidyelki*, or social gatherings of the young country people during the long winter evenings, which begin with spinning and talk and end with songs and dances (p. 32), are not peculiar to Russia, but similar customs prevailed (and to a certain extent still prevail) in most other countries of Europe; in Germany such gatherings of the village youth on winter evenings are called *Spinnstube*, *Rockenstube*, *Kunkelstube*, *Lichtstube*, also *Spinnmühl*, and *Kunkelheimgarten*; in Sicily in the neighbourhood about Noto they are called *sedia* or *sirennà*, and a pleasant description of them is given in the Venetian paper *La Scena*, 1872, No. 8; the writer of which, however, is far from imagining that he is at the same time describing a *Posidyelka*. As a matter of course, many of the Russian songs are devoted to the subject of love. "Here for instance," says Ralston (p. 48), "is the

outline of a romantic story. A brave youth leaves his native Ukraine and enters into the service of 'the King of Lithuania,' who shows him great favour. The king has a fair daughter whose heart is won by the young Cossack, a fact of which the father is made aware by the youth's own evil brothers," who repeat the idle boastings in which he had indulged when under the influence of strong drink. The king in his wrath orders his favourite to be taken out at once to the place of execution. His commands are obeyed, and the youth soon stands at the foot of the gallows. "While he ascended the ladder, and began to bid the princess farewell in a loud voice, she heard him afar off, hastened into her lofty chamber, and taking two steel daggers, pierced her white bosom. In the open field swings the brave youth,—on the daggers bends down the princess and dies." I do not think I am mistaken in seeing something more than an accidental resemblance between this song and the far-famed song of the Scandinavian North, *Hagbard and Signe*; see Svend Grundtvig, *Danmarks Gamle Folkeviser* No. 20.

There is a noteworthy custom prevailing amongst the Ruthenians when a dying man's agony is greatly prolonged, to pass a black dog through a hole made in the roof over his head, in the hope of thereby expediting the liberation of the soul from the body (p. 108). This is obviously a symbolical act meant to show the soul of the dying man the way out of its tenement; for the dog is often used to represent the soul, as I have shown in Pfeiffer's *Germania* xi. 170; it may be remembered too that in the place of Hecuba and the beggar who was stoned, a dog was, in each case, found underneath when the stones were cleared away (see concerning the beggar *Philostr. Vita Apoll.* iv. 10). But that the soul escapes through an opening in the roof is the belief also of the Chinese and North American Indians (Tylor, *Prim. Cult.* i. 477), and arose no doubt because the soul was supposed to leave the house by the same road as the living body entered it, which in early times was always the roof, as was quite lately the case amongst the Aleutians, Kamchadals and Mandans (see the Berlin *Zeitschrift für Ethnologie*, iii. 165); for which reason also in ancient Rome persons supposed to be dead were only allowed to return to their houses through the roof, as is still the custom in Persia (see my paper in the last-named journal, v. 101). If however the soul was conceived to leave the house through the window set open for the purpose as in Germany (Wuttke, *Volksabergl.* § 725), in Russia (Ralston, p. 314, "when all is over the window is immediately opened, and sometimes a cup of water is set on the sill for the use of the departing soul"), and elsewhere; it was usual to carry the corpse out the same way, as amongst the Russians (Ralston, p. 318, "The corpse was often carried out of the house through a window or through a hole made for the purpose, and the custom is still kept up in many parts;") and amongst the Greenlanders (Rink's Supplement, p. 97). In another place (p. 112) we read that *Rai* is the abode of the dead. "There, according to a tradition current amongst the Lithuanians, as well as among some of the Slavonic peoples, dwell the spirits which at some future time are to be sent to live upon earth in mortal bodies, and thither, when disembodied, will they return. No cold winds ever blow there, winter never enters those blissful realms, in which are preserved the seeds and types of all things that live upon the earth," &c. Further on (p. 374) it is related that far away amid the ocean waves, according to Slavonic tradition, lies the island called Buyán, one of the many forms of the *Rai* or Paradise. "There are to be found the Snake older than all snakes, and the prophetic Raven, elder brother of all ravens, and the Bird, the largest and oldest of all birds, with iron beak and copper claws, and the mother of Bees, eldest among bees." This idea that

in heaven there "are preserved the seeds and types of all things that live upon the earth" is likewise not peculiarly Russian; for on the one hand we are told that Yima, at the bidding of Ormuzd (*Vendidad* ii.), laid out a gigantic garden, and brought together in it the germs of all living creatures, cattle great and small, men, dogs, and the red shining fire, &c.; and on the other we meet with an exactly similar idea amongst the North American Indians and the ancient Peruvians (Tylor, *Prim. Cult.* ii. 221). Further on Ralston relates (p. 150), "When a water sprite's wife is about to bear a child, he assumes the appearance of an ordinary mortal, and fetches a midwife from some neighbouring village to attend her." This belief is very widely spread; it is found in various places in Germany (A. Kuhn, *Westphäl. Sagen*, i. 285-6), in Denmark and Sweden (Grimm's *Deutsche Mythol.*, p. 425), in Norway (Fay, *Norske Folke Sagn*, Christian. 1844, p. 32), in Ireland (*K. von K. Erin*, Stuttg., 1847, iii. 243-250), and in Hebrew works (Tendlau, *Das Buch der Sagen und Legenden jüdischer Vorzeit*, 3rd ed., Frankfurt am Main, 1873, p. 122). In speaking of the water spirit (Vodyany), Ralston notices (p. 152) the superstition of the Bohemian fishers who are afraid of assisting a drowning man, thinking the Vodyany will be offended and will drive away the fish from their nets. This idea is familiar to every one from Sir Walter Scott's *Pirate*, and Tylor (*Prim. Cult.* i. 98) remarks on the subject: "Were this inhuman thought noticed in this one district (Zetland) alone, it might be fancied to have had its rise in some local idea now no longer to be explained. But when mentions of similar superstitions are collected among the St. Kilda islanders and the boatmen of the Danube, among French and English sailors, and even out of Europe and among less civilized races, we cease to think of local fancies, but look for some widely accepted belief of the lower culture to account for such a state of things." It is told of the wood demon Lyeshy (p. 158) that if by any chance a passer-by strikes upon his recent trail, he becomes bewildered, and does not easily find his way again; his best plan is to take off his shoes, and reverse their linings, and it may be as well also to turn his shirt or pelisse inside out. There is a German superstition to the same effect, according to which people who lose their way in a wood must either change their shoes or turn their pockets out or fasten their aprons wrong side uppermost (Wuttke, § 630). In the government of Archangel a whirlwind is set down to the wild dancing of a Lyeshy with his bride (p. 160), and in another place (p. 382) we read: "The Russian peasant generally attributes whirlwinds to the wild dances in which the devil indulges when celebrating his marriage with a witch; but sometimes, he thinks, a wizard is being whirled about in the 'dust-spouts' which may be seen in summer in the open plains: and so, if a sharp knife be thrown with good aim at one of them, it will fall to the ground streaming with blood." The notion of certain spirits as dancing with their brides in the whirlwind must have been naturalized in Germany too; for so only can we explain the German name of *Windsbraut* applied to the whirlwind; comp. Grimm (*Mythol.*, p. 598), who observes (p. 599) "throwing the knife is known to German superstition everywhere."

A pleasing legend of the Lusatian Wends given by Ralston (p. 194) runs as follows: "The Virgin Mary and the infant Christ once passed by a field in which a peasant was sowing barley, and she said to him: 'God be with thee, good man! As soon as thou hast sown, take thy sickle and begin to reap.' In a little time came a crowd of Jews in pursuit of her, and asked the peasant if he had seen a mother and child go by. 'She passed not long ago,' he replied, 'just when I was sowing this barley.' 'Idiot! why that must be twelve weeks ago!' exclaimed the Jews, seeing

that the barley was now ripe, and the peasant was reaping it, and they turned back. The same story," Ralston continues, "is told in a Little-Russian *Kolyadka*, only the Virgin carries on her hand a hawk—one of the symbols of the Sun God—instead of leading the infant Christ." This legend is to be found too in Catalonia, in a form resembling the Lusitanian one, and probably in many other countries, being doubtless derived from some version of the apocryphal gospel of the Infancy of Christ. According to the Catalonian version, the holy family, fleeing from the massacre of Bethlehem, came to a man sowing seed; the Virgin Mary bade him fetch his scythe to cut the crop, and he, full of faith, went to do so, and on his return found the crop ripe, so that the holy family could hide behind the first sheaf which he bound. When their pursuers questioned him, he replied that the fugitives had passed when he was sowing the field, at which they turned back disconcerted, and did not hear how a plant of mint and a "hunger bird" (jay, *gaitx*, *garulus glandarius*) called out, "Behind the sheaf!" So that God cursed them both, saying to the plant, "Mint thou art, and thou wilt mint lies; thou shalt bear flowers but no fruit" (*Tu ets menta y mentirás—Florirás y no granarás*). And to the bird he said: "Hungry thou art, and hungry thou shalt remain; however much thou eatest, thou shalt never be satisfied!" (*Gaitx ets y gaita serás—Per tant que menjis, no engreixarás*). And that is why the migt never bears grain, and why the jay when he pounces on a field of buckwheat and goes on eating without stopping, is still always hungry. (Maspons y Labrós, *Lo Rondallayre*, Segona Serie, Barcelona, 1872, p. 28: *La Menta y'l Gaitx*.)

In several places (e.g. pp. 198, 307) Ralston observes that the Slavonic divine blacksmith became transformed in Christian times into the double saint Kuz'ma-Dem'yan (Cosmas and Damian). This transformation, like many others of the kind, is not a little enigmatical, for in all the legends of these saints, as narrated in the *Legenda Aurea* (cap. 143, ed. Grässe), there is nothing at all to remind us of the blacksmith's art, the profession of these two saints, who were martyred under Diocletian, being that of physicians. There is only one word in their legend which could have given occasion to their transformation into smiths. In the account of one of their miraculous cures it is said: "Quidam vir sanctis martiribus serviebat, cui cancer unum crus totum consumserat. Et ecce dormiente illo sancti Cosmas et Damianus devoto suo apparuerunt unguenta et ferramenta secum portantes," &c. It is not quite inconceivable that the word *ferramenta* (iron instruments) may have brought about the transformation of the surgeons into smiths. It would not be the only case of the kind.

Special virtue is ascribed to the dew that falls on certain nights. In White Russia, it is the custom on St. George's day to drive the cattle afield through the morning dew, and in Little Russia and Bulgaria the young people go out early and roll themselves in it. The habit of washing in dew on the morning of St. John's day is common to various Slavonic peoples (pp. 231, 241). The pagan Icelanders and Swedes were also in the habit of bathing in the dew on Midsummer night, "ut morbi corporis miraculose sanentur," as Finn Magnussen mentions, *Lexic. Mythol.*, p. 672. There is a French superstition, "se rouler sur de la rosée d'avoine le jour de S. Jean avant le soleil levé, pour guérir des fièvres." (Thiers, *Traité des Superstitions*, ii. ed., Paris, 1697, i. 301). "En Saintonge, les amoureux vont se rouler nus dans la rosée, pour être aimés de qui ils aiment. Cela s'appelle *prendre l'aiguail de mai*" (Bugeaud, *Chants et Chansons populaires des Provinces de l'Ouest*, Niort, 1866, i. 281). In the neighbourhood of Como there is a saying, "S. John's dew heals every ill" (*La rosada de San Giovanni—La guariss*

*tücc i malann*. Bolza, *Canzoni popolari comasche*, Vienna, 1867, p. 648.) And Thomas Moore in a note on *Lalla Rookh* observes: "The Nucta, or Miraculous Drop, falls in Egypt precisely on St. John's day, and is supposed to have the effect of stopping the plague." Gervasius of Tilbury mentions as an English custom of his own time (beginning of the twelfth century) "Plurimos quoque vidimus potentes, qui sancto die Pentecostes cibum non sumerent, donec rorem de caelo hausissent vel super se descendisse sensissent (see my ed. of the *Otia Imperialia*, Hannov., 1856, p. 2 and note pp. 54-7). Special healing power was attributed to the *Pfingstborn* (Whitsuntide-well) near the town of Steinau in the province of Hanau; people gathered the May-dew on the adjacent meadow, drank it, and washed themselves with it (Lynker, *Hessische Sagen*, No. 329). One sees that Maytime was held sacred in the earliest times, as it still continues to be honoured with various festal celebrations; and this too holds good of Russia. "On Thursday before Trinity Day or Whit Sunday (the Semik holiday) the Russian villagers and the common people in the towns go out into the woods, sing songs, weave garlands, and cut down a young birch tree, which they dress up in woman's clothes, or adorn with many coloured shreds and ribbons. After that comes a feast, at the end of which they take the dressed-up birch tree, carry it home to their village with joyful dance and song, and set it up in one of the houses, where it remains as an honoured guest till Whit Sunday. On the two intervening days they pay visits to the house where their 'guest' is, but on the third day, Whit Sunday, they take her to a stream, and fling her into its waters, throwing their Semik garlands after her. . . . In these instances the Semik birch tree, the 'bush,' the 'poplar,' and the Whitsuntide puppet are all representations of some Deity of the Spring, whom the people worshipped in olden days and whose memory still survives" (p. 234-5). Comp. Grimm, *Mythol.*, 738. Similar customs prevail in Sweden, as appears from a tale of Mrs. Carlén's (Paul Värning), where a popular fête in a village in Småland is spoken of: "A tall maypole was erected on that day (the festival of S. John), as every year, on a broad open space, gaily decked in long garments of birch boughs. The arms, wound round with garlands, bent in dignified semicircles to the slender waist, while the so-called neck shone with tinsel and great pearl necklaces made of strings of blown eggs: a huge crown adorned the head and completed the costume." In antiquity too we find deities, especially feminine ones, occasionally represented by decorated trees. "In Proserpinae sacris celsa arbor in effigiem virginis formamque componitur, et cum intra civitatem fuerit illata, quadraginta noctibus plangitur, quadagesima vero nocte comburitur" (Firm. Mat. de err. prof. rel., 27). Proserpine is of course in all ways nearly related to the goddesses of spring. The following passage (Ralston, p. 238) is still *apropos* of the Whitsuntide festivities: "On the banks of the river Metch, near Tula, there stands a circle of stones. These, according to popular belief, were once girls who formed a Khorovod on this spot, and who danced on Whit Sunday in so furious a manner that they were all thundersmitten into stone." Similar legends to this are found in England (Max Müller's *Chips*, iii. 284-5); Stonehenge itself being called *chorea gigantum* by Geoffrey of Monmouth (cf. Gervas. of Tilbury, ed. Liebrecht, p. 81). Tall upright stones, the more when arranged in a circle, may easily be taken, especially by the lively imagination of the people, for groups of transformed dancers, and we meet accordingly with tales of the kind in very many places, where they are mostly applied to Sabbath-breakers. See Grässe, *Der Tannhäuser und der ewige Jude*, Dresden, 1861, p. 121; Pauli, *Schimpf und Ernst*, No. 388,

with Oesterley's note (Bibliothek des literar. Vereins in Stuttgart No. 88); W. Menzel, *Die Vorchristliche Unsterblichkeitslehre*, Leipzig, 1870, i. 144. A kindred legend in Normandy is quoted by Edélestand du Ménil, *Etudes sur quelques points d'archéologie*, Paris et Leipzig, 1862, p. 472. That there were other ways in which, according to popular belief, the accursed dancers were punished, and that this whole series of Christian legends, mostly of mediæval origin, point to an ancient heathen Phallus worship, has been shown in the *Revue Celtique*, Paris, 1870, vol. i., p. 140., No. 6, by the present writer.

On p. 255 Ralston speaks of a very singular ceremony performed (on the first of September) by the girls in many parts of Russia; they make small coffins of turnips and other vegetables, enclose flies and other insects in them, and then bury them with a great show of mourning; and he observes: "It has been already mentioned that the soul was often represented by the heathen Slavonians as a fly, gnat, or other insect." It would seem therefore that we have to do, in the Russian custom, with a symbolical funeral ceremony held for all the corpses which have been left unburied in the course of the year. Something of the same sort occurs in the Samoan Archipelago, where it is believed that the unburied dead wander about in the air bemoaning themselves, and punish their surviving relatives for their neglect, for which reason the latter sit down, spread out a cloth, and calling upon the gods, wait to see whether any kind of animal crawls upon the cloth. If there comes an ant, or a locust, or anything of that kind, it is the soul of the "young man," and is interred with all due ceremony in place of the missing corpse, but if no animal comes, the spirit is supposed to be angry with the persons seated (Turner, *Nineteen Years in Polynesia*, Lond., 1861, p. 233). The following ceremony observed on wedding days in Russia is also very remarkable (p. 280): "On the top of the steps leading into the house of the bridegroom, his father and mother meet the young couple, and bless them with bread and salt, while some of the relatives pour over them barley and down and give them fresh milk to drink." This sprinkling with corn was at one time an English custom, as appears from Polydore Virgil (*De Inv. Rer.* i. 4): "Spicea corona sponsa redimita caput, praesertim ruri, ducitur, vel manu gerit ipsam coronam: seu dum ingreditur domum, boni ominis causa, super ejus caput jacitur triticum, quasi inde consecutura sit foecunditatem." The like custom prevailed in the Jura, Béarn, Lorraine, Sardinia, Spain, heathen Prussia, India, and amongst the Jews (Edélestand du Ménil, *Etudes sur quelques points*, &c., pp. 4, 55); and again in Tibet: "Le repas fini, les membres des deux familles prennent la fiancée par les bras pour la mener à pied à la maison du futur, ou, si c'est loin, ils la conduisent à cheval. On jette des grains de froment ou d'orge grise sur la fiancée," &c. *Nouv. Fourn. Asiat.* iv. 252. Why barley in particular should be used in this ceremony is explained by Edélestand du Ménil, l. c. p. 4, Bachofen, *Mutterrecht*, Stuttgart, 1861, p. 421, Gubernatis, *Zoological Mythology*, Lond., 1872, i. 47, and others. In one of the Russian marriage songs mention is made of a golden horned stag—one of the forms, perhaps, of the solar deity—who promises to be present at a marriage, and to light up the whole courtyard with his antlers (p. 307). Ralston's conjecture on this point is correct, for the sun-stag is frequently spoken of in northern mythology (see Simrock's *Deutsche Mythologie*, 3rd ed., pp. 275, 321). Amongst the Red-Skins the image of a stag was sacred to the sun (J. G. Müller, *Geschichte der Amerik. Urreligionen*, Basel, 1855, p. 70), and amongst Arabian poets the sun is described as a gazelle (F. G. Bergmann, *Les Chants de Sol. Sôlartiodh*, Strasb. et Paris, 1858, p. 110).

Speaking of wizards and witches, Ralston mentions that sometimes, instead of sending evil spirits to torment a man internally, a witch is supposed to change him by night into a horse and ride him over hill and dale until he is all but dead with fatigue (p. 393). This belief may be met with also in England, Denmark, and Iceland (Henderson, *Notes on the Folk-Lore of the Northern Counties of England*, Lond., 1866, pp. 154-8); in Germany and Flanders (J. W. Wolf, *Deutsche Sagen*, Leipzig, 1845, No. 141. *Niederländ. Sagen*, Leipzig, 1843, No. 389); Tyrol (Schneller, *Mährchen und Sagen aus Wälschtirol*, Innsbruck, 1867, p. 22, No. 3), and in Catalonia (Maspons y Labrós, *Rondallayre*, Barcelona, 1871, No. 23, "La bruixa del ferrer"). According to another Russian superstition, there are heart-devouring witches, who trouble the peasant's repose (p. 413). This idea also is widely spread, and Ralston refers in this context to Grimm (*D. M.*, 1035), who traces it amongst the ancient Romans, the Germans, and Serbs. It is to be found too in the East, for Pietro della Valle (*Voyages*, &c., Rouen, 1745, vi. 164) writes from the Persian harbour Cambrù: "Une vieille arabe, nommée Meluk, fut mise en prison, accusée comme sorcière d'avoir ensorcelé, ou, comme ils ont accoutumé de parler, d'avoir mangé le cœur d'un jeune homme." And Ibn Batuat relates of the Moslem inhabitants of the town Barwen in India: "There are some amongst them who know how to look at a man on such wise, that he immediately falls down dead under their gaze. The common people say that when any one has been in this way killed by a look, if the body is opened, no heart is to be found, so that they say: 'He has eaten his heart.' But this is most commonly done by women; such a woman is called *Kaftar*. When I was a judge in Delhi, a woman was brought to me by a great crowd of persons calling out, 'She is a *Kaftar*, she has eaten the heart of a young man, and he is dead.' They had brought the young man with them; then I commanded them to go at once with her to the Sultan's vizier," &c. (Kosegarten's *Notes on Nechshebi's Touti Nameh*, Stuttg., 1822, pp. 263-4).

From the above examples sufficiently appears the scientific importance of Ralston's work, which fully attains the purpose expressed on the title page, and illustrates both Slavonic mythology and Russian social life in the most attractive and instructive manner.

We come now to the *Folk Tales*, and are glad to find that the task which Ralston has here proposed to himself is accomplished in a not less satisfactory manner. In this selection also he has, of course, made use of the most important collections, and has proceeded with so much taste and judgment that his work takes an honourable place amongst those of its class. As he observes in the Preface: "My chief aim has been to familiarize English readers with the Russian folk-tale; the historical and mythological problems involved in it can be discussed at a later period," it would be out of place to dwell minutely on the latter subjects, and we will only express a hope that in his future investigation of them he will proceed with the calmness and deliberation which has become peculiarly necessary of late, and will not indulge in quite as bold flights of fancy as other students in the same field. But on this point we need not be uneasy, for he has very wisely remarked, at the end of the *Songs*: "Great caution is requisite on the part of every one who undertakes to evolve a mythological system from a mass of popular traditions. In no case is such care more urgently demanded than in that of a student who has to deal with materials of so mixed a nature and of so doubtful an extraction as are the songs and stories of the Russian people,"—or indeed of every people. I will not therefore attempt to forestall the results of Ralston's inquiries into these problems, and will only, as before, call attention to a few points showing

the relationship between the ideas of the Russian people and those of other nations.

In the tale on p. 15 a grandmother says to her granddaughter who is threatened by a fiend: "O dear me, my poor unhappy child! Go quickly to the priest, and ask him this favour—that if you die, your body shall not be taken out of the house through the doorway, but that the ground shall be dug away from under the threshold, and that you shall be dragged out through an opening." What seems here to be an exceptional way of conveying a corpse out of the house was originally the common mode of proceeding amongst various nations, in order to prevent the dead man or his spirit from returning, when this was dreaded, and as it was supposed that the return would take place by the same route as the exit, a way was chosen that could be closed up again. Thus the Tuski take away their dead through a hole in the back part of the hut, and then close up the hole with the greatest care (Dale, *Alaska and its Resources*, p. 378, sqq.); the Hottentots removed their dead from the hut by an opening broken out on purpose to prevent them from finding the way back; the Siamese, with the same intention, break an opening through the house wall to carry the coffin through, and then hurry it at full speed round the house; see Tylor, *Prim. Cult.* ii. 23, who mentions also other cases among various nations of taking out the dead by a gap made on purpose. He adds, "Their motive is not clear:" but it becomes so from what is said above. See also Grimm *Rechtsalt.* pp. 726-8, No. 12. The touching tale of the dead mother who returns from the grave to suckle her child (pp. 19, 20) is repeated in the legends and songs of many lands. The distinguished Danish scholar Svend Grundtvig indeed, in his classical work *Danmarks Gamle Folkeviser*, iii. 868, declares this trait, which appears in a popular Danish song, to be spurious and inconsistent with popular belief, and even improbable and in bad taste; but it recurs too often for this to be tenable, not merely in many German fairy tales and legends (which Grundtvig quotes), but in a Walloon song (*Les Enfants de la Mort*; see Count Puymaigre's "Notes sur quelques Chansons populaires" in the *Revue de l'Est*, Metz, 1868, Extrait pp. 25-8), in one of Provence (*Les Orphelins*; Damase Arbaud, *Chants pop. de la Provence*, i. 73), in Northern Italy (*La povera Lena*; Ferraro, *Canti pop. Monferrini*, No. 32), and lastly in a modern Greek tale (Hahn, No. 83, *Die Elfin als Hausfrau*). In a story of which Ralston (p. 38) says that "it illustrates a custom in which the Russians differ from some other peoples," it is said of a certain shrew "she had not even been wrapped in swaddling clothes when a baby, nor swung in a *liulka*. Thereupon her husband determined to remedy the shortcomings of her early education, and whenever she showed herself capricious or took to squalling, he immediately had her swaddled and placed in a *liulka* and began swinging her to and fro. By the end of a half year she became "quite silky—all her caprices had been swung out of her." Here we are reminded of the old French pleasantry, which Bouchet (Sérées, p. 87) records of a man who had a bad wife, and every time she scolded, had her put in a cradle and rocked till she was still, "ce qui finit par la rendre fort douce."

The account of the price demanded for a cat (Whittington's cat, which however comes originally from further East than Russia) is very remarkable; the master of the animal says (p. 45): "I'll make the beastie stand on his legs while I hold him up by his fore-legs, and you shall pile gold pieces around him so as just to hide him—I shall be content with that." This is a very ancient mode of reckoning or measuring, especially for money fines; it appears in Snorri's *Edda* (Skalda 39), and was also customary in Germany,

England, and amongst the Arabs, as Grimm sets forth at length, *Rechtsalt.* p. 668 sqq., from whence I take the following old Welsh law: "Si quis felem horrei custodem vel occiderit vel furto abstulerit, felis summa cauda suspendatur, capite aream mundam et planam attingente, et in eam grana tritici offundantur, usque dum summitas caudae tritico cooperiatur." Wotton, *Leges Walliae*, iii. 5, who observes that, according to later ordinances in England, any one who killed a swan was obliged to hold it up by the bill and cover it with corn. To Grimm's references may be added the following old Spanish penalty for cat-stealing: "Quicumque gatum furatus fuerit, et dominus gati eum invenerit cum latrone, secundum forum dominus gati debet habere funem unius palmi, que collo gati ligata ab una parte, ab alia ligetur in quodam ligno acuto, quod debet figi ibi ubi ligatus fuerit in aliqua planicie, que LX. pedes contineat circumquaque: et latro debet cooperire milio gatum sic ligatum." (Ferd. Wolf, *Ein Beitrag zur Rechtssymbolik aus Spanischen Quellen*. Reports of the Vienna Acad., li. 109); and a passage from the well-known mediæval poem *Waltharius* (Grimm and Schmeller, p. 16, v. 403-7) "Dixerat 'o si quis mihi Waltharium fugientem—Afferat evinctum, ceu nequam forte liciscam!—Hunc ego mox auro vestirem saepe recocto—Et tellure quidem stantem hinc inde onerarem—Atque viam penitus clausissem vivo talentis.'" Akin to the passage from *Fredegar* (Grimm 672): "ut veniret legatarius Francorum sedens super equum, contum erectum tenens in manum ante aulam palatii Alarici et tam diu Alaricus et Gotthi super eum solidos jactarent, quousque legatum et equum et cacumen contum solidis cooperirent," is another from Meibom, *Script. rer. German.* ii. 332, according to which Margrave Otto of the Arrow (+ 1308) said to Bishop Günther of Magdeburg, who released him from prison for 4000 marks: "Thou knowest not how to fix the ransom of a margrave; I ought to have been seated on horseback with upright lance and to have piled gold and silver round me till the point of the lance was no longer to be seen." In Africa too there are examples of the same way of measuring (which in Germany has given rise to the expression "*die Hülle und die Fülle*," for the skin of the murdered beast was sometimes to be filled as well as covered by the offender), for Laing (*Travels through the Timanee*, &c.) relates that the followers of some Timanee chieftains are obliged to supply them yearly with as much rice as will cover them from head to foot when they are standing upright. Lastly, one may compare the price of the cat in the Russian fairy tale with Jain (in one version of "The Son of the Widow" in Campbell's *Tales of the Western Highlands*), who bought a cow for as much gold as would cover it from nose to tail.

Not less remarkable is the Russian tale (p. 168) which begins by telling how two old people were childless for a long time: "At last the husband went into the forest, felled wood and made a cradle. Into this his wife laid one of the logs he had cut, and began swinging it, crooning the while a rune beginning: 'Swing, blockie dear, swing.' After a little time, behold! the block already had legs. The old woman rejoiced greatly, and began singing anew, and went on singing until the block became a babe." This is apparently the same tale as that Gubernatis notices (*Zoolog. Myth.* i. 408), a parallel to which, in the Finnish epic *Kalevala*, was mentioned before (*Acad.* iv. 225) "as an echo of the widely spread custom of supplying the place of a lost or wished-for child by a doll or a gourd." We have here an additional example of the liveliness of the fancy amongst the grown up children of savage times (cf. Tylor, *Early History of Mankind*, p. 108, 2nd ed.). In like manner the Ostjak women on the Obi make room in their bed for three years for a log of wood representing their deceased husband.

In this connection there are other passages of the *Kalevala* that might be quoted, e.g. where Kullervo says to his father (Schiefner's translation, p. 217): "(Ich) werde auch um dich nicht weinen,—Höre ich, dass du gestorben;—Werd mir einen Vater machen,—Mund und Kopf aus Lehm und Steinen,—Augen aus des Sumpfes Beeren,—Seinen Bart aus dürren Stoppeln,—Füsse ihm aus Weidenzweigen—Fleisch ihm aus verfaulten Bäumen." The most ancient idols, as is well known, were nothing but rough logs; thus *Jupiter Tigillus* (August. *De Civ. Dei*, vii. 1), i.e. Jupiter the beam, or Jupiter worshipped in the form of a beam of wood; so the *Δόκνα* of Sparta, and Festus observes in general: "Delubrum dicebant fustem delibratum, hoc est, decorticatum, quem venerabantur pro deo." See also Otfried Müller, *Archæologie*, &c., p. 47 (1st ed.), and Tylor, *Prim. Cult.* ii. 151. Even the famous *Irmensäule* destroyed by Charlemagne was originally nothing but a "truncus ligni." Grimm, *Mythol.*, p. 106. In another place, where Ralston (p. 159) tells how "a girl obtains from her father a rough dress of pig's skin and two sets of gorgeous apparel; the former she herself assumes, in the latter she dresses up three *Kuklui*, which in this instance were probably mere *blocks of wood*," he is no doubt perfectly right. But he is less so, it seems, where in a note upon another version of the same story he says (p. 161): "The germ of all these repulsive stories about incestuous unions, proposed but not carried out, was probably a nature myth akin to that alluded to in the passage of the *Rigveda* containing the dialogue between Yama and Yami—'where she (the night) implores her brother (the day) to make her his wife, and where he declines her offer because, as he says, they have called it sin that a brother should marry his sister.' Max Müller, *Lectures*, sixth ed. ii. 557." We are in no wise dealing here with a nature myth, for the *ἐνικοῖνος μῖτος*, even between the nearest relations (parents and children, brothers and sisters), was a general custom in the primitive age, and was still to be met with at a later date amongst the Macedonians, Greeks, Alani, Hibernians, Arabs, Persians, Egyptians, &c. (v. Strabo, pp. 201, 735, 783; Justin xi. 9; Arrian, *Exp. Alex.* ii. 11; Bachofen, *Mutterrecht*, Stuttg., 1861, p. 368). Plato (*De Rep.* v. 461) sanctions the marriage of brother and sister, and the "incestuous unions" so frequent in mythology are only a reminiscence of a once general custom transferred to the company of the gods (cf. Braun, *Naturgeschichte der Sage*, München, 1864, p. 476). As late as towards the end of the seventeenth century it was allowable on the Gaboon for the son to marry his mother, and the father his daughter (Bastian, *Rechtsverhältnisse*, &c., Berlin, 1872, p. lxi). Those "incestuous unions" so often spoken of in legends and fairy tales are thus in no way nature myths, but rather echoes of primitive culture, and Ralston's quotation from the *Veda*, where the sister offers to marry her brother, and he rejects the proposal as sinful, is itself such an echo, only belonging to a time when such marriages had been already declared to be sinful. We see here again how cautious one has to be in deriving legendary traits from supposed nature myths, a point on which I have already insisted above (*Acad.* iv. 223). In the same place (p. 225), however, I was also able to confirm the justice of Gubernatis' remark, "that the worship of the bull and cow was widely spread even among northern nations," by referring to Holmboe's treatise, and we now understand the bearing of the passage from a Russian tale given by Ralston (p. 183) where we read: "The princess went into the open field, bowed down before the cow's right foot and got plenty to eat and to drink and fine clothes to put on." Further on (p. 295) we find a fairy tale which Ralston rather prosaically characterises as "one of those tales of the Munchausen class," but which Uhland (*Schriften zur*

*Dichtung und Sage*, iii. 213 ff, especially p. 223 sqq.) thought worthy of full and ample and at the same time poetical treatment. In the Russian tale there is amongst other things a mill that "grinds pies and pancakes;" similar magic mills, amongst which the mill *Grotti* of Snorri's *Edda* belongs, and which always have a mythical origin, are met with constantly in popular tales and songs. I have treated the subject in Benfey's *Orient und Occident*, ii. 275 sqq., and add here some further references; namely, an Icelandic tale in Arnason's *Islenskar Thiodhsögur*, &c., Leipz., 1864, ii. 9, "*Maladhu hvorki malt nè salt*"; a Swedish legend in Berg and Gaedeken's *Nordiske Sagn*, Kjöbenhavn, 1868, p. 22, "*Hulen ved Sandsbygd*;" Widter's *Volkslieder aus Venetien* in the reports of the phil. hist. class of the Vienna Acad., vol. xli., p. 313, No. 78, "*La Superba Mantovana*" (with the note, p. 354); Uhland's *Volkslieder*, No. 32, "*Goldmühle*" (with the note in *Schriften*, iv. 34); Erlach's *Volkslieder der Deutschen*, Mannheim, 1834, i. 137, "*Die Sproede*"; Tarbé, *Romancero de la Champagne*, Reims, 1863-4, ii. 127; Bernoni, *Canti popolari Veneziani*, Venezia, 1873, Puntata xii., p. 15; Chasiotis Συλλογή τῶν κατὰ τὴν Ἠπειρὸν ἐθνομῦτικῶν ἀσμάτων. Ἀθήνη, 1866, p. 33, No. 12, p. 53, No. 43.

It will be apparent from the above remarks that quite apart from the subject matter of the tales, and their counterparts in other countries, which Ralston occasionally notices, but proposes to examine more in detail at a future time, the incidental traits given are of considerable importance, especially in reference to that part of the general history of civilization which deals with manners, customs, and popular beliefs, and that from this point of view also the collection is well deserving of attention. Ralston has not stopped short with translating, but has provided each section (Mythological, Magic and Witchcraft, Ghost Stories, Legends) with a very valuable introduction and the whole work with an equally attractive "Introductory Chapter," in which he shows the relation of Russian popular tales to Russian life, sentiment, and humour, and illustrates them by stories selected for that purpose. Here, as in the *Songs*, he has fully reached his purpose of interesting the general reader in these tales "and through them in the lives of those Russian men and women of low degree who are wont to tell them, those Russian children who love to hear them." But besides the general reader, the learned and literary student will, as we have seen, derive much profit from this book, which, independently of the fifty-one literally rendered tales, contains numerous summaries, in giving which the author aspires to have also kept closely to the text. Only so can such works possess a scientific value. We await with impatience the fulfilment of the author's promise, which we give in his own words: "Besides the stories about animals, I have left unnoticed two other groups of skazkas—those which relate to historical events, and those in which figure the heroes of the Russian 'epic poems' or 'metrical romances.' My next volume will be devoted to the *Builinas*, as those poems are called, and in it the skazkas which are connected with them will find their fitting place. In it also I hope to find space for the discussion of many questions, which in the present volume I have been forced to leave unnoticed."

FELIX LIEBRECHT.

#### LITERARY NOTES.

In the *Revue des deux Mondes* (September 1) M. Renan notices the large work on *La Kabylie et les coutumes kabyles* by General Hanoteau and M. Letourneux, recently published at the *Imprimerie Nationale*. Of the five historical marks (a language, a literature, a religion, a history, and a legislation peculiar to themselves) which M. Renan treats as constituting the individuality of a race, two only, language and legislation,

are found in their purity amongst the Berbers—a name including not only the Kabyles and Touaregs, but all the Saharian tribes, from Senegal to Nubia, that are not of negro or Soudan origin. They have also, what is wanting to some more distinguished races, an alphabet of their own, a character little used, and curiously enough, chiefly known and preserved by women. The native legislation of the Kabyles, which has resisted even the power of the Koran code, is on the same model as that of all the primitive democracies described by Sir Henry Maine. The *djemâa* or village community is the social unit, custom is all-powerful, and stands as usual in such cases both for law and morality, the latter of which is not altogether a loser by the confusion. Charity, hospitality, and good faith are Kabyle virtues, the last especially being honoured in the *anaïa*, an institution in some ways resembling that of patron and client, but that the responsibility of the patron extends from himself to his family, tribe, village, and any other confederation of which he is a member, such as the *cof*, a quite peculiar and less praiseworthy kind of voluntary association, merely factious in origin and kept up chiefly by personal intrigues.

In the same number M. A. Geffroy regrets the conservative bias of M. Charles de Ribbe's new book, *Les familles et la société en France avant la Révolution*, and hopes that he will shortly publish *in extenso* some of the valuable materials upon which it is founded. These are the so-called *Livres de Raison*, the family chronicles, half memoirs, half account books, which it was the custom of grave and prudent fathers of families down to the eighteenth century to keep for their own satisfaction and the instruction of their posterity. M. de Ribbe quotes one of the fifteenth century written in Provençal, in grave notarial style, one of the sixteenth century kept by a *métayer* peasant; that of the family of Garidel at Aix, which gives the history of five generations of influential citizens of the professional class, and many others of equal interest and importance for the history of society in the Provinces. The comparative rarity of such domestic acts, except amongst the Latin races, points to a direct descent of the *Livres de Raison*, or the Italian documents of which Guicciardini's *Ricordi* is a sample, from the *tabulae*, *rationaria*, &c., of the ancient Romans.

In *Fraser* for this month Mr. W. M. Hennessy translates from the Leabhair Brach, an Irish MS. of the fourteenth century, a very interesting legend entitled the Vision of MacConglinny. The narrative professes to rest partly on oral tradition, and partly on the books of Cork, which are appealed to repeatedly to correct errors in the popular version. It is concerned with a scholar of the eighth century who delivered a contemporary king, Cathal by name, whose obit is fixed by the Chronicles, from an animal called a Lon-craes which had established itself inside him, being generated by certain enchanted apples, and caused him to devour food to such an extent as to menace Ireland with ruin. The cure was accomplished by keeping the king at first by stratagem at last by force for three days without food, while MacConglinny described dainties, till at last the Lon-craes was induced to come out, after which it was treated in a way that would have burnt it to death if it had been combustible, and finally departed after some impotent maledictions. The translator observes that the story is a decisive proof that M. Gaidoz is right in thinking that Gargantua is not a pure invention of Rabelais, and goes on to the very doubtful inference that he is only an exaggeration of Cathal. The story is full of purely mythical elements, the meaning of some of which, e.g. the cloaklet of Machin, has been entirely forgotten by the narrator. Its chief historical value is that it presents us with a kind of image of a period when Christianity was turned into a Celtic Magic. The position of the scholar reminds us very much of that of the half fabulous sages who are placed by Hindu tradition at the beginning of Indian history.

The *Cornhill* contains the beginning of one of Miss Thackeray's Modern Fairy Tales. It is a real stroke of genius to turn the beans for which Jack sells his mother's cow into shares in the *Excelsior* newspaper—an organ for the agricultural labourers.

The Danish novelist, H. F. Ewald, whose *Scotch Woman at Tjele* we reviewed at length some months ago, has just fin-

ished another romance, *Agatha*, which will be published in Copenhagen in October. The first half of this book has come into our hands in sheets; it deals with essentially modern questions, especially with the growth of socialism in Denmark.

The Rev. A. B. Grosart, of Blackburn, is about to publish by subscription the complete poetical and prose works of George Herbert, and he has recently announced several important discoveries which justify us in looking for a very satisfactory edition of the writings of this popular English classic. Among these are a MS. of fully one half of "The Temple," Herbert's best known work, with the author's additions and corrections, and six unpublished English poems; two unpublished sets of Latin poems, entitled *Passio Discerpta*, and *Lucus*, in Herbert's autograph, and his own autograph copy of *Triumphans Mortis* and another Latin poem; and a MS. "containing the Orations and public Letters of the Public Orator of the University of Cambridge from 1616 to 1636, thus covering the entire period of Herbert's holding the office." This last will be of special value for the memoir of George Herbert, with which Mr. Grosart intends to introduce this important addition to his excellent "Fuller's Worthies' Library." Translations of the Greek and Latin works and an English glossary will be given, and the text, which has appeared in a sadly corrupted form in all modern reprints, restored to its original purity.

## Art and Archaeology.

### WORKS IN THE ROMAN CATACOMBS.

THE long continued activity and opulent results of researches in the subterranean cemeteries called "Catacombs," may rank among the events signaling the pontificate of Pius IX.; and still more noticeable, as addressing a wider range of students, is the literature illustrative of Christian antiquity called forth from the Roman press, and supplied with subject-matter, by those well-aimed undertakings. The contributions of the late Jesuit Father, Marchi, and those more extensive and generally known from the pen of the Chev. de Rossi, need not here be praised. Two works by the latter, his *Inscriptiones Christianae* and *Roma Sotteranea*, are the fruit of labours pursued, and present the material collected by the learned author, during twenty-one years. Great cause was there to regret the long suspension of the explorations in those hypogaea consequent on the change of government in Rome. I need not here consider the validity of the excuses made for this, or of the reasons attributed to a Pontiff so generous as Pius IX. has shown himself with respect to public works and antiquarian researches, for discontinuing the funds long supplied out of his bounty for *scavi* in the field referred to. Proportionate to regrets at the suspension was the satisfaction naturally felt at the renewal of those explorations, which, after an interval dating from the spring of 1870, ensued in the November of 1871. All that has been accomplished and discovered since is reported in the successive *fascicoli* of De Rossi's *Bullettino di Archeologia Cristiana*—see especially No. IV. of the new series, third year.

The new impulse given to undertakings and studies fortunately bearing precious fruit, in the subterranean cemeteries around Rome, may be dated from the discovery, in 1844, by Padre Marchi, assisted by the then young De Rossi, of ingress into those hypogaea near the Appian Way, known as the "Catacombs of S. Callisto"—followed in 1845 by the discovery, through the exertions of the same individuals, of the alike long-forgotten entrance to a cemetery called after two martyrs, Protus and Hyacinthus, there interred. Thenceforth labours in the same sphere were more systematically prosecuted, with encouragement and assistance from the newly-elected Pope. From 1849 to 1851 the works in two systems of underground corridors and chapels were directed by De Rossi, a monthly assignment for the costs being secured by Pius IX. Presently was ordered by His Holiness an "Apostolic Visitation of the Catacombs;" and finally, in November, 1851, was created a "Commission of Sacred Archaeology," which soon began its task of directing and superintending the *scavi* in that range. This committee, presided over by the Cardinal Vicar, and in imme-

diate dependence on the Pope, has never been dissolved, nor have new authorities interfered with its action; but we hear of its financial distresses as cause of suspension to its proceedings in late years.

There is no little reason for surprise and regret at the comparative neglect in which certain of the most interesting of the subterranean cemeteries, with contents known to be most valuable, have been left since their re-opening at more or less recent dates—e.g. that originally named after the Persian martyrs Abdon and Sennen, whose bodies were brought to Rome and there interred in the fourth century; but which cemetery is now known as "Catacombs of S. Ponziano," from Pontianus, bishop of this see A.D. 230 to 235. In the excavations so-named, we see the most finely characterized and about the best preserved among wall-paintings hitherto discovered in any of the underground oratories or burial places.

The works resumed as I have stated, have been principally in the two hypogaea entered near the Appian Way, one named after a patrician family, *Praetextatus*, the other after S. Callixtus, bishop of the Roman see A.D. 219-223; this last "Catacomb" being supposed to owe its origin to Zephyrinus, immediate predecessor of Callixtus in the same bishopric. It is of historic importance as the place of sepulture for the Roman bishops during the third century, also as the first cemetery which belonged not to any private person but to the local Church in her aggregate capacity, and as the arena chosen for the most solemn festivals of martyrs during at least the whole of the fourth century. Whatever is undertaken in this most promising soil may be deemed of interest, and expected to lead to more or less valuable results; but I am not aware that the latest pursued labours here have yet secured any very rich reward. More noticeable have been the recent *scavi* in the "Catacomb of Pretestato," as to the precise origin of which, and the connection of the ancient *Praetextatus* family with it, we know little, though now assured that it contains the bodies of martyrs who suffered so early as A.D. 161 and 162. The remarkable characteristic of this cemetery is that much of its interior is *architectural*, of regular and in some parts perfectly preserved construction, not merely excavated in the tufa rock, as are other such cemeteries. At one extremity there has evidently been a front, built in brickwork of about the best antique Roman style, and opening on a road, or else on the level Campagna, near the Appian Way. Analogous details are observed in the supposed most ancient section of the cemetery named after Nereus and Achilleus, martyrs who were servants of Flavia Domitilla, the grand-niece of the Emperor Domitian, and who suffered under Trajan. That part of the excavated area which is called after Domitilla herself has a façade, a vestibule (or atrium), and a small chamber on one side provided with a well, no doubt used for baptism, all in antique brickwork, and opening upon what was evidently a road, though now filled up, deep below the surrounding Campagna, near the Via Ardeatina. These unusual details, in the two cemeteries in question, attest the absolute publicity of the hypogaea serving for Christian use, and lead us to infer that neither the funeral rites nor such acts of worship as took place therein were secret, nor under any necessity of concealment owing to the social conditions of the Church at Rome. Evidence to like effect is before us in the so-called "Catacombs of S. Januarius" at Naples. The exaggerated reports of the persecuted and normally depressed state of the Church under the sway of heathen emperors, are rectified by such convincing testimony. We know that Valerianus, with excess of intolerance, forbade the Christians to enter their cemeteries for any purpose whatever; but that this prohibition was withdrawn by Gallienus (his successor, A.D. 261), who restored those burial places to the bishops—thereby acknowledging them as public property of the Church. Another remarkable example of construction as well as decoration in the *Praetextatus* cemetery, is a spacious and lofty hall, entirely built in brickwork, and adorned with wall-paintings classic in style and quite devoid of sacred character and symbolism—the subjects, vintage scenes amidst flowers and foliage, with little winged genii (perhaps intended for the personified seasons) reaping corn or gathering grapes. We might here fancy ourselves in a heathen chapel or mausoleum, but are reminded of Christian consecration by a pleasing and well-designed figure of the Good Shepherd painted in a recess over one of the sepulchral *loculi*, recognised through a well-traced epitaph on a tablet found

near, and identified as the tomb of Januarius, a deacon and martyr who suffered A.D. 162. This cemetery was formerly called by that martyr's name, he being one of the seven sons of Felicitas, all, together with their mother, put to death for their faith. There is mention of a small basilica and other buildings, probably for the residence of the clergy, near the entrance to the sacred place. De Rossi shows that the statements in church history as to bishops or priests residing "in cemeteries" may be generally understood to imply that they dwelt in such buildings *above*, not in subterranean places *within*, the excavated regions. The notion that under pressure of persecution numbers of Christians lived, for safety's sake, in such hypogaea must be rejected—not but that, in extremities of danger, some may have taken refuge in these underground retreats. It is known that certain of the Roman bishops did so conceal themselves in early times.

Other works were commenced last winter in the cemetery near the Salarian Way, named after Thrason and Saturninus, martyrs of whom we know nothing but that they were among the victims of the Diocletian persecution. It is conjectured by Marangoni that these hypogaea were made by the Christians condemned by Maximianus, during that same persecution, to dig for clay wherewith to build the *thermae* dedicated in the name of the former emperor. The cemetery on the Salarian Way has been hitherto little known or explored, though containing many paintings and epigraphs of interest, and an unusual number of those supposed portraits of the deceased in act of prayer with outspread arms—hence called *orantes*. A rarer work of art is a mosaic, with brilliant tints, of several birds (all, no doubt, here introduced as symbolic or mystic) on a disk set into the tufa rock low down beside one of the tombs in a corridor.

Another undertaking of *scavi* carried on not by public or official but private enterprise, and with many interesting results, is in a section of the cemetery of S. Agnes near the Via Nomentana, and entered immediately below the extramural basilica of that saint. These works were commenced nearly two years ago, at intervals suspended and resumed, by the monks (Lateran Canons) of the adjacent monastery, restored for the service of that church by Pius IX. The section of the cemetery thus re-opened is at some distance from the long since known and frequently visited "Catacombs of S. Agnese," though undoubtedly belonging to and communicating with those very extensive hypogaea, which were first thoroughly explored and described (in recent time) by Padre Marchi. The lately discovered corridors and chapels extend in labyrinthine ramifications through which it would be impossible to find one's way without an experienced guide. They comprise three storeys, accessible both from the tribune of the basilica and from the neighbouring S. Costanza—that curious circular church originally erected as a mausoleum for the daughters of Constantine, and the only one of that emperor's numerous buildings for sacred use that still stands in or near Rome. No paintings had been found in this section of the vast cemetery up to the time I last visited it (in the winter of the present year); but the numerous epigraphs, and the evidence, in lapidary style here before us, of ancient origin, deserve to be studied. The Latin epigraphy of successive centuries may be distinguished by all practised eyes; and those versed in such studies have agreed that many of the inscriptions seen here are of the second, that not a few may be referred to the first century of our era—the large clearly incised letters, and the general absence of later-adopted Christian formulæ, alike attesting such early date. Several Christian symbols and monograms, especially that of the Holy Name known as the monogram of Constantine, are seen incised on various tombstones. Another memorable circumstance, and one which has given rise to conjectures, is the connexion between the subterranean burial-places and excavations, different in form from the Christian oratories—namely, two vaulted chambers with the usual recesses for cinerary urns, but where no paintings or inscriptions have been found, though the character and purpose are at once recognisable as heathen, and for heathen sepulture alone. The inference that both Christians and Pagans at the same time used the same cemeteries for their dead, and scrupled not to perform their funeral rites thus promiscuously, is (I believe) neither corroborated by what we see before us in this instance nor by any other monumental proofs; indeed, contradicted

by the whole aggregate of Christian antiquities at Rome. The juxtaposition exemplified in this section of the S. Agnes cemetery may be accounted for as either accidental or a consequence of the extension of the corridors and chapels for Christian use after the downfall (or at least official suppression) of Paganism, when no danger or obvious profanation would be apprehended from such vicinity of the tombs, and when the ashes of the unbelievers were (probably) removed from their disregarded urns.

Beside these details, we have to notice in the newly opened section of this cemetery several of those small glass phials stained with a red substance supposed to be blood, and which, being always found imbedded in the tufa rock beside tombs, are determined by ecclesiastical authority to be recognisable proofs of martyrdom, memorials and evidence to the fate of those beside whose last resting places they are thus deposited. The decree of the Roman congregation on this subject has been called in question; and the theory advanced as preferable that such sepulchral phials are stained not with blood but sacramental wine. It seems fair to state, in favour of the other received and sanctioned theory, that in one instance an inscription of decisive import—*Sanguis Saturnini*—has been found on such a receptacle, not (I believe) extant, but mentioned by Boldetti, a trustworthy witness. And is it possible, one may further urge, that such singular usage as the preservation of the sacramental species especially for a place in deposit near the grave, could have failed to be recorded either in church history or by tradition in some other channels, instead of being solely made known to us through monuments which indicate extraordinary reverence for certain among the Christian dead in subterranean cemeteries?

C. I. HEMANS.

#### NOTES ON ART.

The *Gazette des Beaux-Arts* is particularly rich in illustrations this month, four admirable etchings by Léopold Flameng making it fully worth the eight francs charged for the number. One of these, called "L'Enfant à la Guitare," a jolly little baby boy amusing himself with the strings of that instrument, from a painting by Francesco de Herrera, is a perfect triumph of chiaroscuro, and indeed the same may be said of the more complex subject, "Le Concert de Famille," after Jan Steen, in which the full daylight which Jan Steen as well as Peter de Hooghe frequently sheds over his figures is rendered with wonderful skill.

There are likewise some excellent woodcuts and engravings in illustration of the articles. Of these latter, a criticism by M. René Ménard on the German and Belgian pictures in the Vienna Exhibition occupies a large space in the number, though it is only the first of a series of articles on the Exhibition. This is followed by a second article on "Les Grandes Collections Étrangères," that of Mr. John Wilson, which as stated in the last number of the *Academy* was opened in August for the benefit of the poor of Brussels, being the particular collection now reviewed by M. Charles Tardieu. The Royal Academy Exhibition of this year receives a short notice from M. Eugène Montrosier, but he gives no criticism of any value on the subject of "L'art en Angleterre." The Salon at Antwerp and the Exposition Rétrospective of Tours are likewise reviewed, so that this number of the *Gazette*, as will be seen, is chiefly taken up with art exhibitions. One article however is of more intrinsic importance. Turning away from the attractions of modern art M. Emile Galichon gives us "Quelques notes nouvelles sur Jacobo de Barbaris," otherwise known as the Master of the Caduceus. M. Galichon published the results of his researches into the life and works of this little-known master ten years ago in the *Gazette des Beaux-Arts*, and did not think, he tells us, ever to return to the subject. "Mais qui peut se flatter d'avoir épuisé un sujet d'érudition?" He now, from the study of some niellos that he considers were certainly executed by Jacobo de Barbaris, considers that historians must henceforth add the title of worker in niello to those of painter, engraver, and miniaturist that are already attached to this artist's name. Some documents also have been discovered which throw light on the residence of Barbaris in the Netherlands. In the accounts of Margaret the Regent of the Netherlands he figures as valet de chambre and painter to that Princess, and in 1511 a pension of "cent livres par chacun an" is assigned to him.

Many lovers of art visiting Vienna this summer will turn we fancy with no small sense of relief from the noise and glare of the great World-exhibition of modern art and industry, to a quiet little loan exhibition of the works of old masters which was opened in August last. No town in Germany is richer in treasures of this sort than Vienna, but a great many have been hitherto hidden in private houses, even experts being unaware of their existence. This exhibition, like those of the "Old Masters" at our Royal Academy, has fortunately drawn forth a goodly number of notable paintings from their lurking places, and a rich collection has been formed. ·Netherland art, which is represented by some of its chief masters from the time of the Master of the Johannes altar at Bruges to the later period of Dutch painting, predominates, but the old German school of the fifteenth and sixteenth centuries may likewise be seen in great strength in this small but select exhibition. Of the Italian paintings the most remarkable are by the masters of the Northern Italian schools, followers for the most part of Leonardo da Vinci. Among the works of the Van Eyck school we find one by the newly discovered early Flemish master, Gerard David.

The title of "The German Correggio" was given by Sandrart, the early biographer of Teutonic artists, to the German painter Matthias Grünewald. Dr. Woltman in the present number of the *Zeitschrift für bildende Kunst* vindicates the claim of Grünewald to this appellation, and assigns to him an important altar-piece in the Museum of Colmar which was formerly attributed to Albrecht Dürer, but which has been more recently christened by the name of Hans Baldung Grien, Dr. Waagen and Herr Quandt standing as godfathers. The altar-piece was originally painted for the monastery of St. Anthony at Isenheim, and represents various events in the life of that sorely tried saint. A finely conceived figure of St. Anthony—one of the side wings of the altar-piece—is reproduced in woodcut in the *Zeitschrift*. As background to the patient saint is seen a window with small round panes of glass, which a furious little devil outside is occupied in smashing.

An exhibition of the Art, Archaeology, and Industry of the East, organized by the Oriental Congress, is open this month in the Palais de l'Industrie.

The *Journal Officiel* informs us that the Municipal Council of Paris has recently voted a sum for the purchase of works of art for the embellishment of the city. The Préfet of the Seine has divided the commissions for these works among divers painters, sculptors, engravers, medallists, and painters on glass. The commissions for paintings alone amount to as many as sixteen, the most important perhaps being that given to M. Signol, member of the Institute, who is charged with the decoration of the right arm of the great cross of the church of Saint-Sulpice, the left arm having been painted by him some time ago.

The decoration of the grand church of La Trinité is to be continued, and the painting of two of the chapels has been entrusted to MM. Barrias and Lecomte-Dunouy. Other well-known artists are likewise to be employed on this great work, the expense of which is to be shared by the State with the City. Several works of sculpture have also been ordered for the churches of Paris; we may mention especially a statue of the Virgin to be executed in marble for the new church of Notre-Dame-des-Champs, for which M. Le Père has received the commission. Besides commissioning new works the Municipal Administration charges itself with the restoration of the mural paintings, mutilated statues and other works of art, principally in the churches of Paris, which were injured during the siege and reign of the Commune. All such restorations are confided to trustworthy artists, in one case (that of M. Dumont, whose statue of the Virgin in Notre-Dame de Lorette was broken during the insurrection) the artist himself being charged with the restoration of his own work. It would perhaps be as well if our City Corporation would bear in mind this munificence of the impoverished city of Paris. Who ever heard of the Lord Mayor and Aldermen voting a sum for the purchase of works of art!

The death is announced of Joseph S. Wyon, chief Engraver of Her Majesty's Seals, a title which was held by his father and his grandfather before him. The Great Seal of England now

in use was the first work of the late medallist in his official capacity, and the Great Seal of Canada, which is remarkable for its artistic merit, is also one of his works.

The only medal awarded to British exhibitors of sculpture in the Paris Exhibition of 1867 was bestowed on the late Mr. J. S. Wyon and his brother, who exhibited with him.

The invaluable collections of books, prints, and manuscripts at Windsor Castle are, we learn from the *Times* of the 6th inst., to be protected from one of the most serious casualties to which such treasures are exposed by the Royal Library and Print-room being rendered fireproof. It is to be hoped also that the statements made in a recent letter to the *Times* concerning the insecurity of the National Gallery against fire will be promptly investigated and all necessary precautions taken. It is alarming even to contemplate such an accident as the destruction by fire of our fine National Collection, particularly as the precaution has not been taken, as at Munich, of marking those pictures which in case of such an event should be saved first. Some few of our national pictures might, it must be owned, with advantage be left to the flames.

The *Zeitschrift für bildende Kunst* again gives us one of W. Unger's fine etchings from the Cassel Gallery. This time it is the so-called Woodcutter's Family by Rembrandt that is reproduced.

Sir John Lubbock's Bill for the preservation of public monuments will be again taken up next session. The great difficulty will be its interference with private property. An Englishman's land is as sacred as his house, and the Commissioners can have no more power over one than the other unless armed with an almost Star-Chamber authority. It little avails to address the English landholder in the style of the circular of the French Commissioners, which sets forth—"they should understand that the preservation of ancient monuments interests as much as it honours them, by offering an additional attraction to the meditations of the historian or the curiosity of the traveller." How set forth such considerations to the proprietor, for instance, of Cæsar's camp at Wimbledon, now placarded as to be let on building leases? how set national honour against money's worth? Nothing remains to Government but the system of purchase by compulsory sale, as in the case of property required for railways and other public works.

The French Commission, which was appointed in 1830, receives an annual grant; the Commissioners, however, do not furnish the whole expense of restoration themselves, but grant a portion to the communes. They began by addressing a circular to the prefects, desiring them to furnish a list of the nature and state of the monuments in their several departments, what churches contained tombs, mural paintings, statues, &c., deserving of reparation, and prohibiting any restoration without their authority. Their powers extend to the restoration of all churches, châteaux, amphitheatres, &c., in any way deserving the name of "monuments historiques," and during the last forty years they have expended forty millions of francs (£1,600,000) on their works. A magnificent volume, forming the first livraison of their transactions, has been lately published.

The most eminent of Swedish sculptors, J. P. Molin, died at Waxholm on the 29th of July. His remarkable group of two men fighting a duel within one belt, exhibited here in 1862, will be readily recollected. He was a pupil of the Danish sculptor, Bissen.

### Physical Science.

Jottings during the Cruise of H.M.S. *Ouragoo* among the South Sea Islands in 1865. By Julius L. Brencley. Longmans, Green & Co.

TOWARDS the end of May, 1865, Mr. Brencley, who was then at Sydney, was afforded, through the courtesy of the commodore of H.M. steam frigate "*Curaçoa*," the opportunity of accompanying that man-of-war on a cruise, the main object of which was to carry the British flag in the different archipelagoes of the Western Pacific.

Leaving Sydney early in June, 1865, the course taken was to Norfolk Island, passing north of the Kermadec group, touching at Savage Island; at the Samoa Islands; south to the Friendly Islands; then to the Fijis, by the New Hebrides to the Solomon Islands; on the way back calling at New Caledonia, and from thence to Sydney. The time occupied in this interesting tour was four months; of which probably much more than one half was spent on the sea, and it reflects great credit on the zeal and assiduity of the lamented author of this work that in so short a time he should have accomplished so much; and the recollection of this fact will save some perhaps from feeling disappointed at finding many matters of importance concerning these South Sea Islands very briefly alluded to or altogether passed over.

The author was an enthusiastic traveller, and by no means a bad collector, yet he lacked in great measure that important qualification of a collector which consists in having a more or less intimate knowledge of the objects to be collected. Thanks to the well-known biologists who, in the elaborate and beautifully illustrated appendices to this volume, describe the chief portions of Mr. Brencley's natural history collections, science has not lost by this, but on the contrary, has greatly benefited by the collections made during the cruise. It must, however, be confessed that as a rule we miss in these jottings records of the habits and manners of the animals seen; and when we remember that the collections were for the most part named at the time these notes were printed, we read with no little astonishment sentences like the following, which are supposed to describe the birds and mammals of so seldom visited a place as Cook's Savage Island:—"There exists but one indigenous mammifer in the island, a small rodent, of a size between a water-rat and a mouse. I must not, however, pass over a great bat, which I saw flying at a remarkable height. With the exception of fowls, which are reared everywhere, there are but few birds; among them are pigeons or doves of a green colour, parrots, a pretty little green bird with white feathers under the tail, a small martin or swallow, the tropic bird or the boatswain." And again, "not a venomous reptile is to be found, and even the centipede is unknown" (p. 26). One would smile at this description if it came from the pen of some ship's captain, anxious to tell what he saw, but unable to do so; it is tantalizing, however, to have the like from a man like the author. There was a time when we might have met with a description like the above in the journal of one of H.M.'s lieutenants, but we are happy to think that the interest taken in science by the officers of our navy has at present so much increased that no such suspicion could now cross our minds. Moreover some of the extracts from Lieut. Meade's diary are among the best matter and most interesting descriptions in the book.

So little comparatively is known about the Solomon and New Hebrides groups, that even the little information afforded by these jottings is most acceptable. The latter group of islands was the first visited. Anatom, one of the smallest of the group, contains about 2,200 inhabitants, but this island had been devastated by three fearful epidemics. The natives are docile, eager for knowledge, and, judged by the British standard, a moral race. Some cotton, a little arrowroot, and a few thousand pounds of French beans form, with whale oil, their only articles of export. Tanna, another island of the group, was next visited, but only for the purpose of burning a few villages and killing a few of the natives, as a punishment apparently for their having sent away their missionary; thus it happened that no scientific work was done there.

A very short visit of only a few hours was paid to Sandwich Island, and then they departed from the New Hebrides for a time, Eramanga being visited on the return voyage. The "Curaçoa" next dropped anchor in the Port of Vanua-Lava, one of Banks group. Only a day was spent here, touching for a brief interval at Vanikoro, an island rendered famous in geographical annals by the fate of Laperouse's unfortunate expedition. After a few hours' stay at Santa Cruz, the "Curaçoa" made for the Solomon group. The small islands, Ulakua, Florida, and Uji, were only just visited, but a sojourn of a week on the north-east coast of San Christoval, the largest island of this group, and of three or four days at Ysabel, enabled the author to see something of the inhabitants, and to add very considerably to his natural history collections.

The natives of Ulakua are said to be a puny race of very excitable nature. They have thick bushy woolly hair, stained yellow with lime, and persons of both sexes wear nothing beyond a narrow waist-band. At Uji a village hall was visited, the ornamentation of which consisted of designs painted in various colours; some of the storey-posts being carved to represent a human figure, and the tie-beam bearing carvings of fishes and birds. The islanders were not seen, but it is to be hoped that we may ere long know something more of a people who, call them savage if we will, have, as is evident from specimens of their decorative work given in the two plates in this book, risen to an appreciation of artistic taste.

Some curious designs were also found on the front of houses at a village on San Christoval; one of these, of which a sketch is given, represents a man wearing a hat curiously like those used by Europeans. As however such hats are not worn by sailors, it must be doubtful if these sketches are the work of native artists.

The Solomon group was quitted on 10th September, and the "Curaçoa" shaped her course towards Eramanga, distant some 900 miles. The voyage was an unpleasant one, the ship rolling much in the rough weather they encountered, and a good many of the dried plants were lost. After a fortnight they cast anchor in Dillon's Bay, on the western coast of the island. It was not considered safe to land, but the ship's cutter was sent to the Bay of Sifu to take some soundings, when the master reported that he was fired at by a native from the shore. Mr. Gordon, the missionary, was sent to the two chiefs to desire them to visit the commodore. They declined to come, and the little village of Sifu was shelled—after which, "having nothing more to detain us," the "Curaçoa" weighed anchor, and put to sea, reaching Port de France in New Caledonia on the 30th September. A week was spent agreeably enough on the island. The Government Model Farm at Yahove was visited—all the work at which is done by convicts or disciplinaries; the latter being soldiers who, having committed some military offence, are sent out to the colony to complete their time of

service. Unfortunately no details are given of the crops grown at this station. It appears that next to nothing is known of the natives, and that as yet no native name has been found for the entire island.

Port de France was left on the 8th October, and Sydney reached after a stormy passage on the 13th.

Having now indicated the places touched at during the cruise, we need only direct the reader's attention to the valuable Natural History Notes appended to this volume. The birds are described by the late Mr. George Gray. No new species are described for the first time in these notes, but twenty-seven species are figured in plates from drawings by J. Smit. The fishes and reptiles are described by Dr. Günther. Nine reptiles are described with illustrations by Ford, while descriptions of fifteen fishes are given, and twelve are figured by the same distinguished artist. All the reptiles, with the exception of one, are described for the first time, and Dr. Günther gives a list of sixty-eight fishes from the Solomon group, eleven of which are here described as new species.

Of the invertebrates, the mollusca are described by the late Dr. Baird, and the insecta by Messrs. F. Smith and A. G. Butler of the British Museum. Thirty-three new species of testaceous mollusca and seven new species of hymenoptera are described and figured.

Nine species of Lepidoptera previously described by Mr. Butler are figured.

E. PERCEVAL WRIGHT.

### *Notes on Scientific Work.*

#### *Geography.*

**Africa.**—Dr. Kiepert, of Berlin, has published an interesting contribution to the history of discovery in Africa, in two sheets of maps with an explanatory paper. In one of these sheets he has reduced, to precisely the same scale, eight of the more important and distinctive ancient maps of Africa, beginning with Ptolemy's, about A.D. 130, and ending with Dapper's, of Amsterdam, in 1676. In these the gradual development of knowledge of the coastline of the continent may be clearly traced, until, after the great voyages of Diego Cam, Bartolomeo Diaz, and Vasco de Gama, it assumed nearly the true form; but in all these maps the interior has been filled up from hearsay with a network of anastomosing rivers generally more or less resembling and reproducing the Nile lakes and streams of Ptolemy. A second sheet of six maps illustrates the newer period of African geography, from the beginning of critical mapping by Dr. Anville in 1749, to the state of our knowledge at the present moment. In these the exterior coastline assumes a more and more perfect delineation, and in the interior, from which all fanciful geography of ancient times has been swept away, the slow march of actual discovery is made evident, creeping into and reducing the vast blank spaces which appear on the map, and closing round these till, in the last of all, there are but two large areas of which nothing is known. To the more important of these, the West African *terra incognita*, both the English Livingstone-Congo Expedition and the German party of discovery have turned, and lines of information may soon be obtained through the very heart of this great blank. The scheme of the traveller Rohlfs, about to be carried out, may also unveil the great unknown region of the Libyan desert.

**Arctic Regions.**—Continuing his admirable series of papers on the progress of Polar research Dr. Petermann has now given an account of the fifth Swedish North Polar Expedition, of 1872-73, as far as its work has yet advanced. It will be remembered that the party, fitted out in four ships by the Government and the Swedish Academy, under the leadership of Prof. Nordenskjöld, was according to the plan to winter near the Parry Islands (80° 40' N.) in the north of the Spitzbergen Archipelago, and to proceed thence by means of reindeer sledges over ice towards the Pole. In July of this year two transport ships of the expedition returned to Norway. The account they bring of the chief part of the expedition, though favourable as far as the well-being of its members is concerned, is one of almost complete failure in the geographical objects of the voyage. All attempts to reach the Parry Islands having proved fruitless, Mossel Bay, in 70° 50' N., was selected for wintering, and here a commodious house, brought from Göteborg, was erected. An early misfortune was the escape of the whole of the reindeer intended for use in the sledges, through the carelessness of the Laplanders who had charge of them. The winter however appears to have been passed safely, though the relief they gave to several badly-provisioned Nor-

wegian fishing vessels proved almost too great a drain on their supplies. Repeated examinations of the auroral light by means of the spectro-scope were made during the winter, and are believed to have led to very important results. The most extensive sledge journey yet accomplished by the expedition was undertaken from April to June in this year. In this the Parry Islands were reached, and an attempt was made to go thence northward over the hummocked ice. This failing, the party turned eastward along the coast of North-East land to its furthest extremity, and then ascending the high inland ice which covers this part of Spitzbergen, crossed the island in fifteen days, reaching Mossel Bay again on the 24th June.

[A careful *résumé* of the temperature observations taken during the voyage of the "Challenger" in the North Atlantic is now being prepared at the Admiralty for the ensuing meeting of the British Association at Bradford.]

### Botany.

**Movement of Stamens in *Portulaca*.**—Prof. C. E. Bessey records in the *American Naturalist* for August a singular instance of irritability in the stamens of the two common American species of *Portulaca*, *P. grandiflora* and *oleracea*. If lightly brushed in any direction they immediately bend over with a strong impulse towards the point from which they were brushed, i.e. in the reverse direction to that in which the irritating body is moving, simple contact not appearing to produce the effect. The object of the motion seems to be that by this means the pollen from the stamens may become dusted on to the body of any insect which enters the flower in search of honey. In the nearly allied *Claytonia* there is no similar irritability of the stamens, but cross-fertilization appears to be secured in another manner by the stamens discharging their pollen and then bending back completely against the petals before the stigmas assume their receptive condition.

**Composition of the Puff-Ball.**—Professor Church contributes to the *Journal of Botany* for August a note on the composition of the common fungus *Lycoperdon giganteum*, known as the Giant Puff-ball, which he has found to be as follows:—

	In the fresh state.	Perfectly dry.
Water.....	90.89	.....
Fat, oil, and resinous matter	90	11.00
Albuminoids.....	5.48	66.78
Cellulose or fungin, &c. ..	2.10	14.78
Ash or mineral matter....	.63	7.44
	100.00	100.00

while an analysis of the ash gives the following results:—

Phosphorus pentoxide .....	46.19
Potash .....	35.48
Soda .....	6.95
Lime .....	2.47
Ferric oxide .....	1.08
Silica .....	0.66
Other substances and loss .....	7.17
	100.00

The noticeable features of these analyses are the very large proportion of potassium phosphate in the ash, and of nitrogenous substances in the fresh plant. Prof. Church is however of opinion that a portion of the nitrogen is present in the form of nitrates, which would explain the singular phenomenon that in drying the fungus in a current of dry air scarcely above the temperature of boiling water, the whole mass was seen to glow and become converted into a black charred mass.

**The Gymnospermy of Conifers.**—Prof. Eichler, in a reprint from the *Regensburg Flora*, returns to this much controverted subject, and replies to the arguments of Strasburger in his recently published *Die Coniferen und die Guttaceen*, who maintains that the so-called "integument" of the seed of Gymnosperms has really the character of a pericarp or ovarian wall enclosing a naked nucleus. Dr. Eichler relies, for the correctness of the more prevalent theory, mainly on the analogy with the *Guttaceae*, where he considers it established that ovular structures are formed on leaves which must be considered as open carpels; and these ovules are clearly the analogues of the corresponding structures in Conifers, which must therefore be considered also as naked gymnospermous ovules. The *Cycadeae* would then be the prototype of Angiosperms with ovules produced on the carpels, the *Coniferae* the prototype of Angiosperms with ovules produced from the axis.

### Zoology.

**On the Geographical Relations of the New Zealand Fauna.**—Capt. Hutton, in a paper read before the Wellington Philosophical Society in September, 1872, says that sufficient is now known to establish with great probability the main features in the zoological history of the New Zealand Islands. The fauna may be regarded as the remnant of a

continental fauna, and a close study of it will throw great light on many of the most important and at the same time most obscure problems in zoology. It will however be a long time before this can be accomplished in all its details, and in this paper the author contents himself with pointing out the principal facts that have to be accounted for and the deductions that may be drawn from them. Glancing at the geological and palæontological evidence, he suggests as an hypothesis that will best account for these phenomena: 1. That there was a continental period during which South America, New Zealand, Australia, and South Africa were all connected, though not at the same time, and that New Zealand became isolated before the spread of the mammals and from that time to this has never been completely submerged. 2. Subsidence followed, and the evidence then points to a second continent stretching from New Zealand to Lord Howe Island and New Caledonia and extending into Polynesia for an unknown distance, but certainly not so far as the Sandwich Islands. 3. Subsidence again followed, and New Zealand was reduced for a long time to a number of islands, upon many of which the moa lived. 4. This was followed by an elevation; these islands became connected, and a large island existed disconnected from Polynesia. 5. This was once more followed by subsidence, and the geography of New Zealand assumed somewhat of its present character. (*Trans. New Zealand Institute*, vol. v., pp. 227-256.)

**New Zealand Fishes.**—Capt. Hutton in his contributions to the Ichthyology of New Zealand describes and figures a number of new, rare, or but little known species. The figures, covering seven plates, are outlines of new species not described in Capt. Hutton's *Catalogue of Fishes of New Zealand*, 1872. We find *Neptomenus bilineatus*, *Ditrema violacea*, *Calloptilum punctatum*, and *Ammotretis guntheri*. A number of rare or scarcely known species are also described in detail from fresh specimens, and corrections of errors in the *Catalogue* of New Zealand Fishes are given. (*Trans. New Zeal. Instit.*, vol. v., pp. 259-272.)

**African Reptiles.**—In continuation of his Notes on Reptiles Prof. Barboza du Bocage describes three new species from the interior of Mossamedes: *Lepidosternon anchidæ* from the banks of the river Cunene, *Onychocephalus anomalus* and *O. petersii*, from Huilla and Biballa. There is also appended a list of the species of Typhlops in the Lisbon Museum. Of these, eight species are from Western Africa, and seven species are from other parts of the world. (*Journ. de Scien. Nat. Lisbon*, 1873, No. xv.)

### Anthropology.

**The Congress of Bologna.**—The last number of the publication entitled *Matériaux pour l'histoire primitive et naturelle de l'homme*, iv., pt. 3, 1873, is almost entirely occupied with a report which, though tardy, will be very welcome, on the series of objects illustrative of Italian anthropology and prehistoric archaeology exhibited during the sitting of the Congress at Bologna in 1871. The writers, MM. Cazalis de Fondouce and Cartailhac, have followed, and to their regret could not well have done otherwise, the more convenient than satisfactory geographical order of arrangement which had been found necessary for the sake of keeping together the collections of many of the exhibitors. They begin with Sicily, and in giving it the first place they do not exaggerate its importance, considering its many caverns and grottoes which have yielded evidence first of a fauna more resembling that of Africa than Europe, as for example, the *Elephas Africanus*, and secondly, of remains of human industry associated with the bones of animals, as shown in 1850 by the researches of Falconer, Baron Anca, and Porcari. From Sicily they proceed to the volcanic island of Pantellaria with its cinerary urns of marble or terracotta occasionally containing coins with Phœnician characters, and with its peculiar habitations called *Seni* which resemble somewhat in their construction the *Nuraghi* or round towers of Sardinia. M. Dalla Rosa thinks that these structures had been erected during the stone age; what led him to this opinion being the discovery of some pieces of obsidian more or less worked, and clearly destined to be used as instruments of some kind. Under the head of Sardinia we have, after a short notice of the Carthaginian settlements in the island, a very interesting account of the remains of the inhabitants during the primitive age, and possibly in part during their dependence under the Carthaginians as illustrated by the *Nuraghi*, the tombs and monoliths. The *Nuraghi* or round towers which exist in vast numbers throughout the island, are built of large blocks of stone, jointed and hewn, it appears, by means of bronze tools. They vary in height from 16-20 metres, and in diameter at the base from 12-35 metres. They contain two or three apartments one above the other and with access from one to the other by means of steps left in the wall. With regard to the tombs and monoliths, their age is determined by the discovery of objects in stone and bronze in or near them. M. Spano assigns some of the objects in stone to the archæolithic period, but the writers of the report dissent from his opinion, believing them to be neolithic. As yet there would seem to be no evidence of the island having been inhabited in the archæolithic age. What we know is that, towards the end of the neolithic period, it was inhabited by a people

who had reached that stage in which they were able to construct dwellings of the kind seen in the Nuraghi of the earliest type and in the tombs. In this stage they appear to have been brought into contact with the Phœnicians, a people accustomed to working in metal, and in search of districts where, as in Sardinia, a wealth of metals and minerals was to be found. Having learned from them the use of metal tools, the inhabitants of Sardinia were now able to construct their Nuraghi and tombs in a more perfect fashion. Of the presence and influence of the Phœnicians in the island many remains have been found. From the connection of Sardinia with the West of Europe during the stone age, and with the Eastern nations during the age that followed, the archaeology of the island offers a field for the study of prehistoric archaeology of more than usual interest. In a similar way the writers of the report proceed to examine the various collections from the islands of Palmaria, Pianosa, and Elba, and from the districts of Liguria, the Apennines, and the hills of Pisani.

### History.

*Bibliotheca Rerum Germanicarum* edidit Philippus Jaffé. Tomus Sextus: Monumenta Alcuiniana a Philippo Jaffeo praeeparata ediderunt Wattenbach et Duemmler. Berolini apud Weidmannos. 1873.

HISTORICAL scholars will not object to a new edition of Alcuin's letters, although it forms part of a collection of materials for early German history. According to the plan of the late lamented Dr. Jaffé, an Alcuin volume was to be added to his *Monumenta Corbeiensia, Gregoriana, Moguntina, Carolina, and Bambergensia*. Nearly two thirds of it were completed, when his sudden death stopped the work early in the spring of 1870, and the melancholy duty of completing the rest devolved upon two of his friends. There is hardly a task more tiresome and at the same time more ungrateful than editing and printing from another man's manuscripts and collations. But in this case particularly a vast mass of Jaffé's materials had to be examined over again in order to establish the text with the same minute diplomatic exactness which he was anxious to attain, innumerable quotations had to be hunted up, and the dates to be settled as far as it is possible to do so. Consequently the two posthumous editors have had much more to do than merely to superintend the printing of the volume.

Professor Wattenbach is the co-editor of the first portion, which contains the life of Alcuin (written by a monk of Ferrières in Anjou between 823 and 829), Alcuin's own *Vita S. Willibrordi*, and his well-known *Carmen de pontificibus et sanctis ecclesiae Eboracensis*. No codices are extant of the first and third work, so that the editions of Surius, Mabillon, Duchesne, and Froben had to be carefully consulted in connection with Baeda, whose ecclesiastical history is the foundation of the principal parts of the York poem. It may be worth while to mention that the anonymous biographer, writing in the first half of the ninth century, used the compound *Engelsaxo* apparently as a designation for Englishman not uncommon on the continent, p. 25. Alcuin's poem commemorating the school and library of York in his own days has been frequently ascribed to the time when he himself lived on the continent. But not a single verse hints at his absence from York; the work accordingly must have been written before he accepted the invitation of Charles, and therefore between the death of Archbishop Aelbert of York, Nov. 8, 780, and 782 (cf. p. 80). For the life of Saint Willibrord, the apostle of the Frisians and the founder of the see of Utrecht, a work which Alcuin composed both in prose and in verse, some very good manuscripts have been collated, principally with the object of restoring the original text, the uncouth latinity of which, though undoubtedly to be ascribed to Alcuin himself, had been smoothed away considerably by former editors. Thanks to Jaffé and to Wattenbach, we now have an excellent copy, preserving the life of one of the most important Northumbrian missionaries of the eighth century, by his most celebrated literary countryman.

Professor Dümmler, assisted by Wattenbach, has finished the more arduous labour—the editing of the letters. As these have been largely used as epistolary models ever since the latter part of the ninth century, there naturally exists a considerable number of manuscripts, more or less early and complete, in England, France, and Germany, and also in the Vatican, from whence certain additions have been obtained quite recently by the help of another scholar. With the exception of the Roman ones, Jaffé had re-examined nearly every codex himself, and had arranged more than half of the letters for the press, especially those referring to England. Few people are aware how difficult it is to establish a chronological order in epistles, all of which are without any date whatever, many dealing merely in moral arguments and

alluding to no historical fact or person. Moreover the copyists have frequently substituted a barren capital for the name written out in full. However, Jaffé's sagacious scholarship had overcome many of these obstacles, so that the framework of the new order was being prepared, very different indeed from that of former editors, Canisius, Duchesne, Mabillon, and Froben. Yet here and there it has been again changed, since Dümmler, while arranging one third of the letters generally from internal evidence, arrived at different conclusions. He had also to ascertain a large number of quotations marked with a D, and was apparently not altogether satisfied with the rather erratic orthography which Jaffé attributed to Alcuin as original. Indeed it may be affirmed that there is scarcely a single letter which has not been tested by some new light thrown on the subject by Dümmler's elaborate criticism. Important publications like Haddan and Stubbs' *Councils and Ecclesiastical Documents relating to Great Britain and Ireland*, vol. iii., have certainly not been overlooked. Whereas Mr. Stubbs regretted that Jaffé's book was not finished when he selected twenty-one of Alcuin's letters, three of them unpublished, for his most interesting volume, the German editors acknowledge in their turn the assistance of the English scholar. But they have every reason to be proud of now issuing a mass of 306 letters, written by Alcuin or illustrating his life and studies, much more correct in style and more intelligible than all their predecessors were able to render them, thirty-four of which are printed for the first time, and six, which were fragments, restored to integrity in this volume.

It has often been said, that Alcuin does not hold such a conspicuous place in the literary history of England as he deserves, since his talents and learning were transferred to the court of Charles the Great. No doubt, only about thirty letters were written before the year 793, when he left York the second time, never to return. But can there be the least question, that his correspondence is just as valuable in regard to the contemporary history of his native island, political, ecclesiastical, and literary, as in regard to that of the rise and growth of the Carolingian empire, among the intellectual instructors of which he certainly appears to have been one of the foremost?

A few references in both directions may suffice to point out the importance of this great international schoolmaster. Wherever he mentions Archbishop Aelberht (767-780), he does not omit an expression of gratitude for what he owes to his teaching. The greater number of his correspondents are English churchmen, his superiors and his pupils, either at home or abroad. In an early letter (Ep. 14), he calls the continental Saxons *antiqui Saxones*, just as Baeda and the Anglo-Saxon Chronicle do. In his letters to the monks of Wearmouth and Jarrow he is fond of referring them to their own great scholar (Epp. 27. 274). With Baeda he dates the settlement of his forefathers in Britain from about 449: *Ecce trecentis et quinquaginta ferme annis, quod nos nostrique patres hujus pulcherrime patrie incolae fuimus*, Ep. 22 (793). Again he is supported by Baeda's History when he reminds the Church of Canterbury of her priority: *Apud vos clarissima lumina Britanniae requiescunt, per quos lux veritatis per totam Britanniam emicuit*, Ep. 86. It is mainly, too, from Baeda's astronomical and chronological calculations that he teaches king Charles the convergence of the lunar and the solar system and the paschal cycle, as adopted by Latin Christendom. Alcuin himself is the principal mediator between the king of the Franks on the one hand, and Offa of Mercia and Aethelred of Northumbria on the other. Hence both the Acts of the two English Synods of 786 (why does Dümmler suppose that the northern council was possibly held at Corbridge, instead of Finchale, p. 160?)

and Charles's celebrated letter to Offa are published without omission in this collection, Epp. 10. 57, as well as in that of Mr. Stubbs. It was only in consequence of the intestine commotions after Offa's death and Aethelred's assassination that Alcuin, who in the first destruction of Lindisfarne by the Danes thought he saw the finger of God, gave up the desire of ever returning home again, Epp. 79. 80. 86 (797).

On the other side he was mixed up more and more with the relations of church and state on the continent. His familiar correspondence with Charles (David), with Angilbert (Homerus), and Archbishop Arn of Salzburg (Aquila), is full of valuable and sometimes charming details, even though he and his friends may occasionally disagree. As he was recalled from York chiefly for the purpose of assisting in the theological contest against the heresy of Felix of Urgel and Elipand of Toledo, there are of course many documents altogether taken up with Anti-adoptionist dogmatics. Moreover Alcuin's help was required to refute the decrees of the second Council of Nice, in which the Greeks had re-established the worship of images. It is very remarkable to observe, that as the Northumbrian divine had little taste for idolatry, so he most wisely advised his royal friend not to irritate the weak faith of the recently converted Avars and Saxons by a strict exaction of tithes, Epp. 67. 69. 114. Nothing, however, is more important than to follow up the vestiges of information which throw light on the question how far Alcuin was initiated and perhaps even instrumental in the restoration of the Empire by Charles the Great. I wish to notice particularly some words of Ep. 114 (May, 799), after the expulsion of Pope Leo III. by the Romans and the deposition of Constantine V. by his mother Irene have been mentioned: *Ecce in te solo tota salus ecclesiarum Christi inclinata incumbit. Tu vindex scelerum, tu rector errantium, tu consolator maerentium, tu exaltatio bonorum*. In Ep. 159, written early in 801 to the Emperor's sister Gisla, he rejoices in the exaltation of his most excellent Lord David. A little later, Ep. 163 (after April 1, 801), he communicates to Archbishop Arn his great satisfaction about the imperial crown and the pope's restoration. In Ep. 191 (802), addressed to Charles himself, he says: *Dignitas imperialis a Deo ordinata, ad nil aliud exaltata videtur, nisi populo praeesse et prodesse*.

When shortly after he gave up the abbacy of Tours on account of bad health, some change of mind was evidently taking place with regard to his favourite studies. Archbishop Ricbod of Mainz (Macharius) is reproached with his love of Virgil, Ep. 216, and in a letter to Gundrada, a cousin of the Emperor, evangelical truth is opposed to "Virgiliaca mendacia," Ep. 243. By the playful exchange of Teutonic names for those of Hebrew, Greek, and Roman celebrities, some of Alcuin's correspondents still remain hidden even to the searching perspicacity of scholars like Jaffé and his learned friends. Ep. 282 is directed to Anthropolos, Monna in the superscription, a priest unquestionably from the north of England, and to Stratocles, to whom one may perhaps venture to restore his native name of Aethelhere.

R. PAULI.

### Intelligence.

On the 12th of August died at Stuttgart, aged 69 years, Dr. Christoph Friedrich von Stälin, director of the Royal Library and one of the most learned and meritorious historians of Germany. He never occupied a professorial chair, but for a number of years had been a member of the Society for early German History, originally superintending the editorship of the *Monumenta Germaniae Historica*, and a very useful companion of the Munich Historical Commission. His *Württembergische Geschichte*—which was begun in 1841, but of which the first instalment of vol. iv, containing the turbulent reign of Duke Ulrich, the period of the peasants' rebellion and the reformation of the church, was published in the year 1870—is universally acknowledged to be a perfect model of

a provincial history (Landesgeschichte) in regard both of completeness and of methodical precision. The second portion of vol. iv. has been left ready for press and will be published in a very short time.

Messrs. Longmans announce a series of Histories in small and cheap volumes, under the general editorship of the Rev. E. E. Morris, M.A., which is likely to advance a sounder method of historical teaching in our schools. Its special object is to promote "a horizontal rather than a vertical study of history," i.e. each volume will be a history of all the States of Europe at a particular period. Among the volumes which are to appear in this series, as at present arranged, we may mention those by Dean Church on the Beginning of the Middle Ages; by Prof. Stubbs on the Early Plantagenets and their relation to the history of Europe; by Mr. J. Gairdner on the Houses of Lancaster and York; by Mr. F. Seebohm on the Era of the Protestant Revolution; by the Rev. M. Creighton on the Age of Elizabeth; by Mr. S. R. Gardiner on the Thirty Years' War; by Mr. J. L. Sanford on the Stuarts and the Puritan Revolution; and by Mr. J. M. Ludlow on the War of American Independence.

The Camden Society have in the press *The Military Memoirs of Colonel Birch*, edited by the late Rev. J. Webb and the Rev. T. W. Webb, illustrating the period of the Civil War. It will be followed by *Letters addressed to Sir Joseph Williamson*, edited by W. D. Christie, C.B., furnishing detailed information on the proceedings at Court during the time of the so-called Cabal ministry.

**Académie Royale des Sciences, des Lettres, et des Beaux-Arts de Belgique.**—The Class of Literature and the Moral and Political Sciences has issued its list of subjects for the prize competitions of 1874 and 1875. I. Prizes will be given in 1874 for the best essay on each of the following subjects:—

- (1.) *On the life and reign of Septimius Severus.*
- (2.) *A detailed account of the philosophy of St. Anselm of Canterbury; its sources, its value, and influence on the history of ideas.*
- (3.) *The economical theory of the relations of labour and capital.*  
[The essay to be simple in style, and within the comprehension of all classes of society.]
- (4.) *A history of Flemish ("thiopic") philology to the end of the 16th century.*
- (5.) *An account of the negotiations which ended in the Treaty of Westphalia (1648); and the character and results of that Treaty in relation to the Low Countries.*

[Candidates to consult unpublished documents.]

The prizes for the best essays on the first and second subjects will be a gold medal of the value of 600 francs; the prize for each of the other subjects will be of the value of 1,000 francs. Essays must be legibly written in French, Flemish, or Latin, and quotations verified by accurate references to editions, pages, &c., of the works cited. Authors must send in their essays before February 1st, 1874, addressed, post paid, to M. Ad. Quetelet, secrétaire perpétuel; they must not sign their names, but must affix a motto, and enclose their real name and address in a sealed envelope marked with the same motto on the outside.

II. The subjects of the competition for 1875 are as follows:—

- (1.) *What would be the advantages and disadvantages of the free exercise of the liberal professions in Belgium?*
- (2.) *Explain the historical phenomenon of the preservation of our national character through all periods of foreign rule.*
- (3.) *The French encyclopædists endeavoured in the second half of the eighteenth century to make the Principality of Liège the chief centre of their propaganda. Trace the means which they employed, and the results of their attempts, as seen in their influence on the periodical press, and on the literary movement generally.*
- (4.) *Write a history of Jacqueline de Bavière, Countess of Hainault, Holland, and Zealand, and Lady of Friesland.*

[Candidates should pay special attention to the principal events in the life and reign of this princess, and should use, without following them too implicitly, the principal works, foreign as well as Belgian, bearing on this period.]

- (5.) *Give the history of the public finances of Belgium since 1830, characterising, in their principles and results, the different legislative enactments, and the principal administrative measures relating to them.* [The essay to include a summary view of the finances of the provinces and communes.]

The prize in each case will be a gold medal of the value of 600 francs.

III. The "Prix de Stassart" (value 600 francs) will be awarded to the author of the best essay on *Christophe Plantin, his relations and labours, and the influence of the press founded by him*. As this prize will be awarded chiefly on the ground of literary merit, candidates need not quote their authorities, unless in cases of vital importance.

IV. The sexennial prize of 3,000 francs will be given for the best essay on the following subject:—*A view of the constitutional principles common to our various provinces, and those peculiar to each of them, at the time of the French invasion in 1794.*

The conditions above stated apply also to all these competitions, and essays must be sent to the secretary, as above, before February 1st, 1875.

## Contents of the Journals.

**Literarisches Centralblatt**, 14th June, reviews Gardthausen's *Die geographischen Quellen Ammian's*, and Kraus' *Roma Sotterranea* [a translation of Northcote and Brownlow's book].—21st June, praises Keller *De Juba Appiani Cassique Dionis auctore*, and Franck's valuable treatise, *Die Landgrafschaften des heiligen römischen Reichs*.—Weber criticises Jacobi *De astrologiae indicæ horæ appellatæ originibus*, and Speijer *De ceremonia apud Indos, quæ vocatur jatakarma*.—Peiper's *Ekkhardi primi Waltherii* is reviewed, our first complete critical edition; the prologue and the poem are not by the same author, but Peiper's solution of the whole question is perhaps too artificial.—28th June notices Herrmann's *Zeitgenössische Berichte zur Geschichte Russlands* [contemporary Prussian and Austrian accounts of Peter the Great].—An account follows of Schmidt's inquiry into the sources of 'Hyginus' *Fabulae*, and of Victor Hehn's interesting tract *Das Salz. Eine kulturhistor. Studie*.—5th July reviews Ranke's edition of the Correspondence between Frederic William IV. and Bunsen [to which Ranke's own position and views lend additional interest].—Meissner's *Untersuchungen über Shakespeares "Sturm"* receives praise. He thinks Ayer's *Die schöne Sidea* was used directly by Shakespeare, and illustrates largely from Strachey's account of a shipwreck on the Bermudas.—Zingerle's *Das deutsche Kinderspiel im Mittelalter* will interest those who inquire into the antiquity of children's games in England.—12th July reviews favourably Lüttke's *Ägypten's neue Zeit*, though preferring in some points Lady Duff Gordon's account of home life in Egypt.—Vambery's *Uigurische Sprachmonumente* is also praised; his history of Transoxiana was recently criticised unfavourably.—Bucheler analyses Heydemann's *Die Vasensammlungen des Museo Nazionale zu Neapel*, and suggests some corrections in the inscriptions.—19th July says Motte's *Étude sur Marcus Agrippa* much overrates Agrippa's achievements and unfairly depreciates Augustus.—Sanders' *Wörterbuch deutscher Synonymen* is most severely criticised. Sanders attacked Jacob Grimm's great Dictionary, when the first numbers appeared, in an absurd manner.

**Bullettino dell' Instituto di Corrispondenza Archeologica**, June and July, contains descriptions of the Etruscan tombs at Corneto. The main object in our present inquiries is to distinguish the true national art from its Grecised form. Similar descriptions of the excavations at Nassano and Capua enable us to compare the Campanian mode of representing nature and mythical subjects. The number of Etruscan inscriptions is fast increasing; one of the new ones confirms the view that the vernacular name for Mars was Laran. The mosaics at Baccano (on the Via Cassia, sixteen miles from the Porta del Popolo) are shown to have value for the history of Art. A fragment of pottery found in the Emporium proves the existence of trade with Thubuscum (*Tac. Ann.* iv. 24), perhaps in salt fish. Last come three late Greek inscriptions from Mantinea, Argos, and Sparta.

**Zeitschrift für Numismatik**. Herausgegeben von Dr. Alfred von Sallet. Erster Band. Erstes Heft. Berlin: Weidmann. 1873.—This new numismatic journal is intended to deal with the whole subject down to the sixteenth century inclusive. It begins with an admirably clear essay by E. Curtius on Greek colonial coins. The rule was for the colony to copy the coins of the mother city; thus the western colonies of Corinth have the Pegasus on their silver money. The exceptions to the rule are large, but they may perhaps be rather considered as extensions of the rule itself, e.g. when there is a transfer of allegiance as it were to a new mother city or to a new sovereign. Some cities in late times even adopted Athens as their intellectual parent.—A. v. Sallet describes a series of the coins of Chersonesus in the Crimea, which probably retained its purely Greek character to the last; at least it is doubtful whether any Imperial coins are rightly assigned to it.—A. v. Rauch gives an estimate of the metallic worth of Greek and Roman silver money, ascertained by actually melting a number of coins.—Brandis contributes an interesting account of family devices on Greek coins, the occurrence of which is difficult to prove; sometimes however father and son are found using the same device; it is shown that the devices do not belong to the Eponymous magistrates named in the inscriptions; the induction is based on a large collection of instances.—Dannenberg distinguishes between the various coins of the Hohenstaufen dynasty, minted at Aachen and Köln, about which there has been much confusion.—There are two plates in this number, and the type is exceedingly good. The articles by Curtius and Brandis are of general interest.

## New Publications.

ARNOLD, B. *Das altrömische Theatergebäude*. Leipzig: Teubner.  
BRUYN, M. D. DE. *Palaestina ex veteris ævi monumentis ac recentiorum observationibus*. Editio tertia. Utrecht: Kemink & Zoon.  
CHRONIQUES gréco-romanes inédites ou peu connues, publiées par Ch. Hopf. Berlin: Weidmann.

- CODEX Juris bohemic. Tomi III. pars II. Complectens jus terrae saeculi XV. (1420-1500). Ed. Hermenegildus Jirecek. Prag: Tempisky.
- ENCK, A. De S. Adalhardo abbate Corbeiae antiquae et novae. Münster: Theissing.
- HENFREY, H. W. Numismata Cromwelliana; or, The Medall History of Oliver Cromwell. Illustrated by his Coins, Medals, and Seals. Part I. J. R. Smith.
- JUSTE, Th. Les fondateurs de la monarchie belge. Tome XV. Le Baron Stockmar. Bruxelles: Muquardt.
- KOSKINEN, Y. Finnische Geschichte von den frühesten Zeiten bis auf die Gegenwart. Leipzig: Duncker und Humblot.
- LA MARMORA, A. Un po' più di luce sugli eventi politici e militari dell'anno 1866. Firenze: Barbèra.

- PROLEGOMENA ad tabulam geographicam Palaestinae, quam novis curis emendatam edidit M. D. de Bruyn. (Inest disquisitio de situ Taricheae.) Utrecht: Kemink & Zoon.
- ROLLS SERIES. Calendar of State Papers and MSS. relating to English affairs preserved in the Archives and Collections of North Italy. Vol. V. 1534-1554. (Embraces correspondence between the Ambassador Capello and the Signory, and some valuable correspondence of Cardinal Pole.) Edited by Rawdon Brown. Longmans.
- SCHMIDT, M. Das Leben Konons. Leipzig: Körner.
- SMITH, Joseph. Bibliotheca anti-Quakeriana; or, A Catalogue of Books adverse to the Society of Friends. J. Smith.

### Philology.

- Éléments de Grammaire Basque, dialecte Souletin, suivis d'un Vocabulaire Basque-Français et Français-Basque. Par Louis Gèze. Bayonne. 1873.
- Guide Élémentaire de la Conversation Français-Basque (Labourdin) précédé d'un abrégé de Grammaire. Bayonne. 1873.

THE first of these works was the subject of merited commendation by many most distinguished Basque scholars at the Congrès Scientifique de France, held at Pau in the spring of the present year. M. L. Gèze, as he informs us in his preface, belongs to the increasing band of scholars who, though not "Escualdun," have mastered the difficulties of "Escuara," and who have generously endeavoured to smooth the way for others who may succeed them. M. J. Vinson, one of the joint editors of the *Revue Linguistique*, author of the *Notions Grammaticales* anonymously prefixed to the reprint of the *Guide Élémentaire de la Conversation Français-Basque* in the Labourdin dialect, is also an example of a foreigner successfully writing on Basque grammar.

Both of these works are written with a view to practical ends rather than to comparative or scientific philology. Each begins with a few remarks on Basque orthography and pronunciation, but with scarcely sufficient attention to the latter; although perhaps enough is said for practical purposes. We think, however, that it would have been well for M. Gèze to notice that in pronouncing the *u* as in French, the Souletin stands alone among the Basque dialects. In the others it is pronounced more as the Spanish or English *u*. Thus the Souletin *ou* represents the *u* of the other dialects. Without a knowledge of this fact a stranger might not immediately see that, e.g. *ur* (Labourdin) and *hour* (Souletin) water, are identical words, the difference of orthography depending solely on the pronunciation. In the *s* we prefer the fuller explanation of M. Gèze to that of M. Vinson. *S*, says the former (p. 2), "A un son spécial qui se rapproche du *ch* français. Dans quelques mots que l'usage enseigne, il a un son doux qui se rapproche du *j*." The latter merely says: "*s*, presque comme *ch* français." But Prince L. L. Bonaparte, in a paper read before the Philological Society, seems to have hit the mark as to the relations of *j* and *s*. "*j* in Soule becomes almost French *j*; and in Roncal and other places it is *sh*. The *s* has a peculiar palatalised sound throughout" (*Athenæum*, June 14, 1873). Both MM. Gèze and Vinson omit to notice the peculiar modification of *s* after *t* in the middle of a word. We have never

succeeded in representing this to our satisfaction by any collocation of letters; and that the difficulty is not imaginary the various methods employed in writing a word like Itzatzu prove. The official orthography seems now to be Itxassou. Other combinations are Itxatsou, Itsatsou or *u*. We have got French, Gascons, English and Germans to pronounce this word after the natives, but never (as it seemed to our ears) with complete success. This may seem to be trifling, but the real interest of Basque does not lie in its being a spoken language or in its modern literature, but in its place in comparative philology, and in the light thence thrown on ethnology and anthropology. It seems to us that in attempting to decipher the characters of the so-called Iberian (presumed Basque) inscriptions and coins, it is of the highest consequence to determine what sounds in modern Escuara are most peculiar to it; for these would be most probably those which are expressed in the less known characters of those inscriptions.

In endeavouring to write for practical purposes only we think that M. Gèze has somewhat confused his subject by attempting to form a Basque grammar on too close an analogy with French and Latin grammar; e.g. he writes (p. 6): "L'article n'existe pas en basque," and, after explanation of its functions in French, "en basque ces deux buts sont remplis par des différences dans la terminaisons des mots." He gives (p. 18) a table of terminations of the substantive, and makes (p. 7) fourteen cases: three nominative, four dative, two each for gen., accus., and abl., and one vocative. The two simple nominative are *a* singular and *ac* plural. We think the explanation of M. Vinson (p. ix) quite as simple, and far more scientific. "Il n'y a pas là, à proprement parler, de déclinaisons analogues à celles du latin et du grec. Toutes ces terminaisons accumulées en basque les unes sur les autres, ne sont point des cas, mais bien de véritables particules qui jouent le rôle de nos articles et de nos prépositions, qui, au lieu de se mettre devant le mot, se placent derrière lui et qu'on a pris l'habitude, dans l'écriture, de réunir à ce mot. . . Le basque a un article défini qui est *a* au singulier et *ak* au pluriel."

Thus when M. Gèze comes afterwards to treat of prepositions (pp. 28, 29) he is involved in ambiguities. "Les prépositions qui se joignent au substantif ont beaucoup de rapport avec les terminaisons de la déclinaison. La distinction est presque nulle, et il n'est pas deux grammairiens d'accord sur le point de séparation." Would not some of this confusion be avoided by the remark that many parts of speech which are pre-positions in French and Aryan tongues become post-positions in Basque, and when joined to the substantive serve to mark the inflexion? Extending this remark it becomes at once apparent that the Basque is an agglutinative language; although it may be difficult to determine with what member of that extensive family it may have the closest affinity. Analogies, more or less close, have been detected by Prince L. L. Bonaparte with the Finnish; by M. d'Abbadie with the Hamitic; by Charency and others with the Algonquin and some other Canadian dialects; by Vinson with the Dravidian; and by Sayce with the Accadian. All these are agglutinative languages, and consequently all comparisons of Basque with Hebrew or other Semitic tongues, and with Keltic, whether as parent, sister, or daughter, or with any other Aryan tongue, would seem beside the mark. In common with other agglutinative tongues, the Basque possesses great powers of assimilation and facility for producing new forms. These powers it has most freely used on the languages of all races with which it has come in contact; hence the very mixed nature of the vocabulary, and the danger of hazarding theories as to the character of the language from it.

We are sorry to see that M. Gèze has made so much use of ecclesiastical Basque in the vocabulary appended to his Grammar. It is this which, to our mind, partially vitiates the labours of so many Basque scholars, especially of foreigners, e.g. the late Philips of Vienna. The real interest of the language lies in the portion, if it can be discovered, anterior to Christianity and unaffected by it. It is true that the older books and MSS. are difficult to obtain, and have the reputation of being almost unintelligible. Yet for the Souletin dialect there are the poems of Oyhenart, and the proverbs collected by him. Songs and ballads, at least modern ones, are not wanting in that dialect. Another and much more plentiful, but as yet almost unused source, is the pastorales or dramas, which are written almost exclusively in the Souletin dialect, and of which numerous MSS. are in possession of the village "éditeurs." We do not suppose that any of these are of any antiquity (the subjects seem to be taken either from the Chansons de Geste, or from the lives of the Saints), but dramatic literature often prefers and preserves more archaic forms than those used in other branches of literature.

As to the unintelligibility of the older Basque, this we are persuaded has been greatly overstated. The difference is often mainly orthographical. The forthcoming edition of the poems of Bernard Dechepare, now in the press at Bayonne, under the superintendence of M. J. Vinson, will, we think, establish this. M. d'Abbadie assures us that the Basque of the oldest MSS., though differing widely from the literary language, is almost identical with the "Basque de cuisine" of the present day. Many of the words which Larramendi was supposed to have invented in his *Diccionario trilingue* have been discovered by Prince Bonaparte to exist in various dialects. One branch of allied investigation, and one which can only be successfully followed by native Basques, should be attended to without delay—this is the collection of whatever may remain of genuine Basque folklore. One specimen of this which has been signalized to us as still existing, though unrecorded, is the legend of the Cyclops (Tartarua).

Among peculiarities of the Basque we may observe that its numerical system was perhaps originally quinal and not decimal; that the week apparently consisted of three days only, the first, middle, last day—Astelehen, astearte, asteazken; and, as stated on the authority of M. le Chanoine Inchauspé, that the names of all cutting instruments seem to have been derived from radicals signifying rock or stone. These and other peculiarities may at some future period give some aid towards an approximative conclusion as to the comparative antiquity of the Basque race and language.

WENTWORTH WEBSTER.

Forbiger's *Virgil*. 4th Edition. Vols. i. and ii. (*Eclogues, Georgics, Aeneid* i.-vi.) Leipzig: Hinrichs.

It is unnecessary to dwell at length on the general characteristics of a work so well known to English scholars as Forbiger's edition of *Virgil*: on the candour and generosity with which, often at the expense of the form of his notes, the editor is careful to embody the views of all the better commentators on his author: on the fulness of his illustrations, the multitude of his references, and the general moderation and good sense of his criticism and views of interpretation. More than twenty years have elapsed since the appearance of Forbiger's third edition: and he has taken the trouble, *more suo*, to make the notes now before us a chronicle of all that criticism has done for Virgil in the long interval. English scholars will be especially glad to find that the labours of Conington have received the fullest and most liberal recognition. It is almost needless to state that

Forbiger has to a great extent reformed the orthography with which he was contented in 1852, though he does not follow Ribbeck in culling from the MSS. such choicer rarities as *quodannis*, *sephyris*, *forsitam*, *possimus* (for *possumus*), *bocula*, *fraglantia*. The spelling of the notes has however not been thoroughly recast; such *priscae vestigia fraudis*, for instance, as *coelum* and *conditio* still occasionally lurking unamended.

In preparing his fourth edition Forbiger has, of course, not been uninfluenced by Ribbeck's text: but, though not so conservative as Conington, he has declined in a great number of cases to abandon his former judgment. He reads, for instance, in E. i, 66, "rapidum Cretae Oaxen," not with Ribbeck "rapidum cretae": in E. 2 he declines to omit vv. 32-34: in E. 3, 110 he still reads, "haud metuet," not (as Ribbeck) "haud temnet": in G. 4, 62 he retains "jussos saporos" as against Ribbeck's "tussos": ib. 400 he reads "frangentur," not "franguntur": 415 "diffundit," not "defundit": in *Aen.* i, 396 he altogether declines, we are glad to say, Ribbeck's "capsos"; in 2, 616 he still retains "nimbo," of which more below. Only once in the *Eclogues* does Forbiger follow Ribbeck in adopting the numerical division of the lines which, under the name of *σχήμα κατ' ἀριθμὸν*, is familiar to the readers of Ellis's *Catullus*. The one exception is the eighth Eclogue, where Forbiger has followed not Ribbeck's arrangement (which appears to us the best), but Gebauer's. In the *Georgics* it appears that Forbiger mostly approves of Ribbeck's transpositions, though as a rule (exceptions are G. 3, 120-122, 4, 248 foll.) he avoids altering his text to suit them. As he nowhere mentions, we conclude that he had not when writing his notes yet come across Conington's criticisms of Ribbeck's Prolegomena published at the end of the third volume of his *Virgil*. Conington's mastery of the literary point of view, so important in dealing with a poet like Virgil, enabled him to show that in most cases where Ribbeck proposes a transposition the traditional order is better suited to the spirit and genius of Virgil's composition. We would refer in particular to Conington's discussions of G. 2, 371 foll. and 4, 228 foll. (vol. iii. p. 472-3), as striking instances of the truth of this remark.

The main body and the general character of the commentary remain the same as in the third edition, though the editor has swelled its bulk very considerably (in the second volume by some 130 pages) by the mass of fresh discussion and illustration introduced. A mere commendation of its laborious fulness would be of little service: it may be more useful to point out a few passages in which further illustration of Virgil's language seems still possible.

In E. 4, 15 Virgil says, speaking of the righteous king of his prophecy, "Ille deum vitam accipiet, divisque videbit Permixtos heroas, et ipse videbitur illis": words which are generally referred to the return of the golden age, when men, according to Hesiod, "lived like gods," and to the familiar intercourse between gods and men supposed by the Roman poets (not by Hesiod) to be a characteristic of the golden age. Virgil's words will no doubt bear this simple meaning: but the phrase "deum vitam accipere" is hardly an obvious equivalent for "deorum vitam agere": nor, when we consider that Virgil elsewhere uses the simple expression, "fruitur deorum colloquio," does it seem natural that he should have meant no more than this by the remarkable words, "divosque videbit," &c. It seems to us possible that the language of the whole passage is adumbrated from the mysteries: "accipiet" being suggested by the phrase "sacra accipere," "to be initiated into mysteries," "deum vita" by the popular notion (see Plato *Phaedo*, pp. 69, 81) that an initiation into the Eleusinia was an introduction to

a life with the gods, and "divosque videbit," &c., to the exhibition of statues of gods and heroes which was one of the chief attractions of the Eleusinia. Thus "deum vitam accipiet" will mean "shall be initiated into the life of the gods." This criticism may appear far-fetched, but it should be remembered that Virgil chose his words with extraordinary care, often repeating himself with little or no variation when the language appeared to him to be a perfect expression of his thought, and hardly ever, in important matters, using language which had not to his mind, if not some cherished association, at least some more or less exquisite justification.

The difficult passage *G.* 4, 290 foll., where Virgil seems to have confused his geography beyond ordinary poetical licence or conventionality in making the Nile flow from India ("usque coloratis amnis devexus ab Indis") may perhaps be illustrated by an indication of the popular conceptions of geography afforded by Arrian (6, 1), according to whom Alexander, on first seeing crocodiles on the Indus, concluded that he had discovered the upper course of the Nile. Such an idea could not have been possible, had not considerable confusion existed at the time in the popular imagination as to the limits and extent of Africa and Asia: and whether the popular imagination on those matters was more enlightened in the time of Augustus than in that of Alexander may be doubtful. To take "Indis" of the Aethiopians, as Forbiger still does, would not be necessary if our hypothesis be correct.

In the discussion on the first lines of the *Aeneid* Forbiger might have added that the words "Arma virumque cano" are found scribbled on the walls of Pompeii, furnishing further proof that they were the first words of the poem. It may be also observed here (as we do not think any commentator has remarked it) that although several expressions in the opening of the *Aeneid* recall the opening of the *Odyssey*, the rhythm and general structure of the first seven lines of the *Aeneid* (beginning with "Arma virumque") are taken from that of the first seven lines of the *Iliad*: and that the first two and the last lines of the seven in each case are, in point of metre, precisely similar.

In 1, 22 ("sic volvere Parcas"), and the similar passage 3, 375, it seems possible that the word "volvere" was suggested by *κυλίνδω* in *Od.* 8, 81, *τότε γάρ βα κυλίνδετο πημάτων ἀρχή Τρωσὶ τε καὶ Δαναοῖσι Διὸς μεγάλου διὰ βουλᾶς*.

Several passages have been hitherto passed over in which the narrative of the first *Aeneid* recalls passages in the early part of the *Odyssey*: thus Virgil's "Sis felix quaeuamque" is Homer's *κλῆθι, ἀναξ, ὅτις ἐσσί* (*Aen.* 1, 330, *Od.* 5, 445) where also Homer's *πολλὰ μογήσας* seems to have suggested Virgil's "nostrum laborem." Venus' "haud equidem tali me dignor honore" (1, 335) is like Ulysses' *οὐ γὰρ ἔγωγε Ἀθανάτοισιν εἶκα* (*Od.* 7, 208). "Quisquis es, haud credo, invisis caelestibus auras Vitalis carpis, Tyriam qui advenieris urbem" (1, 387) does not so much suggest *Od.* 3, 27 as 6, 240, where Nausicaa says *οὐ πάντων ἀέκρητι θεῶν, οἱ Ὀλυμπον ἔχουσι, Φαίηκεσσι δ' ἄνῃρ ἐπιμίσγεται ἀντιθέοισιν*. The grove in the midst of Carthage (*Aen.* 1, 441) is suggested by the *ἀγλαὸν ἄλσος Ἀθήνης* near the city of the Phaeacians, *Od.* 6, 291.

In *Aen.* 1, 374 after "si vacet audire" Forbiger reads "diem Vesper componet," Conington "conponat." Forbiger may be right, though we suspect that strict grammar is on Conington's side. But Forbiger overstates his case when he speaks of "almost all MSS." giving "conponet": for the authority of the two important uncials, Pal. and Rom., the first of which reads originally and the second without any alteration "conponat," is surely sufficient to counterbalance a host of inferior testimony. Nor do we understand how Forbiger can appeal to Orelli's

*Cicero* as giving in the similar passage, *Tusc.* 5, 35, 102, "dies deficiat, si velim paupertatis causam defendere." In the edition of Orelli now before us (1861) Baiter distinctly reads *deficiat*. And the passage from Saleius Bassus quoted by Forbiger at the end of his note in support of *conponat* ("Sed prius emenso Titan *versetur* Olympo, Quam mea tot laudes decurrere carmina *possint*") surely makes very strongly for *conponat*.

1, 599. May not "exhaustos casibus" be a Virgilian inversion for "exhaustis casibus"?

2, 615-6. "Iam summas arces Tritonia, respice, Pallas Insedit, nimbo effulgens et Gorgone saeva." We are glad to see that Forbiger retains "nimbo" here, in spite of the preference of most modern scholars for "limbo," the variant mentioned by Servius. Whence, indeed, could "nimbo" have come, except from the hand of Virgil? Forbiger has, however, hardly done justice to Conington's opinion that Virgil in this passage meant to translate *Il.* 15, 308, where Apollo is described as *εἰμένον ὤμουιν νεφέλην, ἔχε δ' αἰγίδα θοῦριν*: a comparison which, if correct (and it is at least very plausible), shows that "saeva" is the abl., not the nom. We may add that there are two passages which, so far as we know, have been hitherto overlooked by the advocates both of "nimbus" and "limbus." The first is *Il.* 18, 203 foll., where Athene arms Achilles with the aegis and crowns his head with a cloud from which issues a blaze of flame: the second, from a very different poet (Prudentius, *contra Symmachum* 2, 576), makes for "limbum": "Nec Paphiam niveae vexere columbae, Cujus inauratum tremeret gens Persica limbum."

3, 525. "Magnum cratera corona Induit": is it possible that in this and similar passages Virgil was mistranslating Homer's *ἀνθεμοέντι λέβητι* *Od.* 3, 440?

6, 126. "Facilis descensus Averno": the nearest Greek parallel to (perhaps the origin of) this passage seems to be Aeschylus quoted by Plato (*Phaedo*, p. 108 a) *ἐστὶ δ' ἀρα ἡ πορεία οὐχ ὡς ὁ Λίσχυλον Τήλεφος λέγει· ἐκείνος μὲν γὰρ ἀπλὴν οἰμόν φησιν εἰς Αἴδου φέρειν*.

6, 273 foll. "Vestibulum ante ipsum primisque in faucibus Orci," &c. Germanus showed that Virgil was here thinking of *Lucr.* 3, 65 foll.: but Virgil's debt to the third book of Lucretius does not end here. Notice Virgil's "terribiles visu formae," "luctus," "ultrices curae," "morbi," "metus," "sopor," and then read side by side with his description *Lucr.* (3, 459 foll.) describing the diseases of the mind:—

"His accedit uti videamus, corpus ut ipsum  
suscipere inmanis morbos durumque dolorem,  
sic animum curas acris luctumque metumque,

interdumque gravi lethargo fertur in altum  
aeternumque soporem oculis nutuque cadenti."

Virgil, *more suo*, personifies where Lucretius employs abstract expressions. Now if we are right in comparing these passages, it seems to follow, as was suggested some years ago by a reviewer of Conington's second volume, that Virgil's "consanguineus Leti Sopor" is not "sleep" but "lethargy": that Seneca so understood Virgil seems very probable from the description of Hades in the *Hercules Furens* (a passage modelled in every line upon Virgil), where we read (v. 690), "Taxo imminente, quam tenent *segnis Sopor*, Famesque maesta tabido rictu jacens," &c. Forbiger is of course right in quoting Hesiod, *Theogony* 758: but he might with advantage have brought out more clearly that Hesiod's *ὕπνος καὶ θάνατος, δεινοὶ θεοί*, have their abode in the underworld.

6, 427. "Infantumque animae fientes in limine primo" is explained by Conington as a reference to the Roman habit

of burying new-born infants "in suggrundis," under the eaves of the house: Forbiger does not allude to this interpretation, nor does he fully discuss the difficulty of the line. It may perhaps be worth noticing that the ghost in Plautus' *Mostellaria* (2, 2, 67) is made to say, "Nam me Acheruntum recipere Orcus noluist, Quia praemature vita careo." The infants in *Virgil* are indeed allowed to cross the Styx: but they do not get further than the threshold of Orcus. Both the passage in *Plautus* and that in *Virgil* seem to be based on a notion that a full term of life ended by a natural or honourable or happy death was a necessary condition for a complete admission into the under-world. We have not been able to pursue the traces of this notion any further: but its existence seems to be confirmed by the fact that in *Virgil's* Hades the unjustly-condemned, suicides, and victims of unrequited love have their place next to the infants.

6, 545. "Explebo numerum, reddarque tenebris." Mr. Long's idea that "numerus" means "my place" is confirmed by Seneca *ad Marciam* 12, 3, "degenerem aliquem et numerum tantum nomenque filii expleturum": Forbiger seems inclined to take it as = "the number of the shades."

A passage in the 47th poem of Antipater of Sidon will illustrate "Sed Nox atra caput tristi circumvolat umbra": he says there of Erinna οὐδὲ μελαίνης Νυκτὸς ὑπὸ σκιερῇ κωλύεται πτέρυγι. It is curious that *Lucretius* should have translated the last two lines of the same poem.

Before bringing this notice to a close we should add that the book is disfigured by a considerable number of misprints, e.g. *rarum* for *ramum* in 5, 854. It is inevitable that in such a mass of references as Forbiger makes a point of giving there should be some inaccuracies: we have noticed the following:—On 1, 264 Forbiger quotes 6, 852 and 8, 316 as instances of "mores" used for "leges": in both places *Virgil* has the singular of *mos*: the further reference to 8, 42 and 11, 708 we cannot understand. On 1, 269 "annuos orbes" is quoted from 5, 46 instead of "annuus orbis." On 1, 499 Forbiger remarks, "Alibi Vergilius syllabam (primam voc. *Dianae*) ubique corripit, etiam Nominativo xi. 582." In that passage ("sola contenta Diana") "*Diana*" is the abl. On 2, 585 "Calydona merentem" is quoted from 7, 307 as if "merentem" were equivalent to "sontem" and had no accusative after it: the fact being that in that passage "merentem" governs "scelus." On 2, 273 a reference is made to the *eighth* book of *Tacitus's* *Histories*. On 6, 79 the line of *Varius* "Insultare docet campis fingitque morando" is quoted from *Macrobius* without any hint as to its real author, so that an uninformed reader would suppose it had been written by *Macrobius* himself. On 6, 254 we cannot comprehend what Forbiger means by saying that we find *semper* (with a long final syllable) in *Lucretius* 3, 2. The word *semper* does not occur in that line, and we had always supposed that *Lucretius* rarely, if ever, allowed himself such a licence.

We look forward with great interest to the appearance of the third volume, which will complete the commentary on the *Aeneid*. H. NETTLESHIP.

### Intelligence.

The English Dialect Society now numbers about 150 members, at a subscription of half-a-guinea per annum; the hon. sec. being the Rev. W. W. Skeat, 1, Cintra-terrace, Cambridge, and the treasurer the Rev. J. W. Cartmell, of Christ's College, Cambridge. Now that several communications have been sent in or are preparing for publication, new members are much wanted to pay for the printing of the matter collected. The first publications of the Society, issued to subscribers for the year 1873, will be ready by the end of the year. Glossaries of words in use in Swaledale, in Nidderdale, near Leeds, and in Hampshire, are in course of preparation. A glossary of Yorkshire words, printed in 1781, will be reprinted shortly.

*New York.*—WILMER & ROGERS.

\* \* BOOKS FOR REVIEW may be sent to the care of Messrs. WILLIAMS and NORGATE, or to their Agents on the Continent.

By ROBERT FERGUSON, 8vo, price 14s.

## The Teutonic Name-System, applied to the

Family Names of France, England, and Germany.

"The interesting and comprehensive problem the author himself thus sets before us. His object is to bring into connection the family names of France, England, and Germany, so far as the German element is concerned, as members of one common family, and to arrange them on a definite system, in accordance with the nomenclature of the old Germans. He holds the opinion that a large proportion of French as well as of English names are of Teutonic origin, which, heretofore, has not been assumed to be the case to the same extent. . . . All this he has worked out with independent judgment, and, it must be admitted, with general correctness; he has, moreover, made some new suggestions, which commend themselves, for the explanation of French and English names."—*Professor Dietrich, in the Jahrbuch für Romanische und Englische Literatur.*

## University College, London.—Department of the Fine Arts.

The Slade Professor, E. G. POYNTER, Esq., A.R.A., will deliver an INTRODUCTORY LECTURE, open to the public, at 4.30 P.M. on Thursday, October 2.

The CLASSES for DRAWING, PAINTING, and SCULPTURE will begin on the following morning at 9.30.

The late Mr. FELIX SLADE has by his will founded SIX SCHOLARSHIPS of £50 per annum each, tenable for three years by Students of the College for proficiency in DRAWING, PAINTING, and SCULPTURE. Two of these Scholarships may be awarded in 1874, the competition for which will be limited to those who enter the Fine Art Classes before November 16 next, and whose age on June 6, 1874, will not be more than nineteen years. Ladies, as well as gentlemen, are eligible to obtain Slade Scholarships.

Prospectuses, containing full information respecting Fees, Times of Class Meetings, the Regulations relating to the Slade Scholarships and Prizes, with other particulars, may be obtained on application at the College, Gower-street, W.C.

JOHN ROBSON, B.A.,  
 Secretary to the Council.

August, 1873.

## The Owens College, Manchester. (The Session 1873-4 will be opened in the New Buildings in Oxford-road.)

## General Literature.

*Alcestis. A Novel.* 2 vols. Smith, Elder, and Co.

A MUSICAL English novel is rare, a clever English musical novel rarer yet; *Alcestis* as both musical and clever deserves hearty welcome. Despite more than a reminiscence of *Consuelo* in general tone, choice of time and place, and conception of the character of the heroine, this story is fresh and original, and indicates a hand vigorous if somewhat untried. German life and German music being the subject matter, it is natural that the manner of German musical romances should have unconsciously been assumed by the author of *Alcestis*: but the German colour reaches even deeper than this; the style reads like a spirited translation, the sentimental *timbre*, the picturesque mode of presenting scenes in the drama are thoroughly German. However, if this foreign element be a fault, it is also a charm, and imparts a certain piquant flavour to the book.

The artistic career, speaking now of music and the drama, affords much more material for a powerful novelist than is commonly used by English writers; possibly because the "artist" is a product not wholly understood in England, scarcely one of those natural growths of the soil whose origin and development are well known and classified. The artist as evolved out of the brain of most novel writers among us (with a few honourable exceptions), is either a delicate being fed on rose leaves, exercising any amount of power as actor, singer, virtuoso, by some false prerogative without need of work, ever ready to expand seraphic wings and fly out of sight of the adoring crowd: or else a rather coarse, passionate individual, a "woman-killer" or a Circe, given to running away with other people's property in the form of husbands, wives, or purses, loud talking, brilliantly revolving amid glare of foot lamps and acclaim of clapping palms. The author of *Alcestis* merits gratitude for giving us something nearer nature. Josquin Dorioz, violinist and composer, Elisabetha Vaara, vocalist, are, thank Heaven, healthy man and woman, neither animals nor seraphs, but human creatures, with all infirmities that flesh is heir to, yet akin to the gods through the possession of a divine genius, sustained by loyal labour and devotion: true artists these—who find in art strength for sacrifice, comfort in trouble, satisfaction to the hunger of the soul.

The plan of *Alcestis* reveals so much of the purpose of the book that I will without apology give it somewhat in full. Josquin Dorioz, né Gasparein, son of French artist mother and aristocratic Viennese father, now deprived of both parents, escapes from the house of bondage, represented by the family mansion in Vienna, and fiddles his way to freedom and North Germany on the precious Straduarius inherited from his mother. Arriving hungry but aspiring at Dresden, he is taken under the protection of Nodin, buffo tenor, and Elisabetha Vaara, herself once rescued from beggary by Nodin for love of her superb voice. Elisabetha and Josquin become pupils together in the choir of old Adolphus Hasse, then in full swing of glory as composer of the severe contrapuntal school, untainted by romantic heresy. Elisabetha pure, "responsible," noble hearted (very like our old friend *Consuelo*), ever steadfast to the high call of her art, becomes a polar star to the career of Josquin, who is the fiery, impulsive, sensitively-tempered creature to be expected from his inheritance of Viennese and French blood. To Elisabetha, to the ideal which she upholds and strives after, the erratic Josquin returns out of the temptations of popularity, passion, and pleasant ease. The young violinist is taken up by Faustina Bordoni, Hasse's wife, a faded star of operatic celebrity, now beneficently shining on rising lights; through success obtained in her salons, he becomes pet *protégé* and chamber musician to Count von Lichtenberg, a musical dilettante of the first water, refined to the verge of weakness, *blasé* of society, politics, religion, a seeker in art of the "illusions that shall carry him through the prosaical staleness of life." The Count has a niece, Cécile, irresistible in loveliness, before whom the heart of Josquin, artist-like responsive to beauty, melts into worship: there is also a pale abbé named Paradies, who writes Greek plays, and projects under the inspiration of Josquin's violin the scheme of a drama with Elisabetha as heroine and Dorioz as composer. Josquin, bound with gilded fetters of elegant conventionalities and delicious flirtation, and half content with servitude, grinds away obediently at composition and performance, though now and then the artist-conscience rebels, and bids him break away to tread again the "solitary path of genius," where Elisabetha beckons upward. When Dresden is beleaguered by Daun's army, Josquin Dorioz is

away with the Lichtenbergs in Italy, and afterwards at Vienna; here increasing admiration easily won, Cécile growing kind, illusions manifold and brightly coloured threaten to sink the young artist into the mere popular player: his creative faculty, the jewel of his genius, dims, Elisabetha and the noble artistic career shine faintly in the background. But one night Gluck is in Vienna, the *Orpheus and Eurydice* is given at the opera house. Josquin, his heart in his ears, feels the call of the master; his soul rises up to meet the voice which summons him—the artist, to fulfil his mission; in the flood of fresh, strong music his soul receives baptism into renewed effort. A report that Elisabetha Vaara is playing out the last week of her performance at Dresden in one of Hasse's operas, gives Josquin the conclusive impetus; he starts for Dresden at once, and arrives at the theatre the closing night, in time to see the friend of his youth triumphant in the grand result of single-hearted devotion to her art.

Now comes the tragedy of our story. A period of quiet work and progress ensues, in which the artist pair work side by side; Josquin organises people's concerts of good music under Elisabetha's influence, and begins to work at his first opera "*Alcestis*," for which Paradies furnishes the libretto, and in which the Vaara is to be the heroine. The acceptance of the opera at the Dresden theatre will lie in the hands of Hof-Intendant Plauen, for old Hasse, now out of fashion, can do nothing for his pupil. But Plauen is in love with Elisabetha, and sees a rival in the composer of "*Alcestis*." Renewed love-passages with Cécile von Lichtenberg end in bitter disillusion and despair, and broken-hearted Josquin, further crushed by the refusal of his opera, collapses; the sensitive body gives way under the strain of mental anguish. At this crisis Elisabetha, whose friendship has been troubled by jealousy and the consciousness of unrewarded love, devotes herself to her prodigal. She buys the acceptance of Josquin's opera with the sacrifice of herself, and privately becomes the wife of the Count Plauen on condition of the immediate performance of "*Alcestis*" and concealment of her marriage till Josquin shall have left Dresden for Italy: if her friend is to die he shall at any rate know one great joy first, and the artist-soul which has been bound up so long with her own shall achieve reward. So "*Alcestis*" is performed, and Elisabetha, throwing out her soul into the part which has for her an awful significance of sacrifice, crowns love with thorns, as the house rings with plaudits for the happy Josquin, all unconscious of the price paid for his triumph.

The motive of *Alcestis* seems to be the aspiration of the true artist in contest with circumstance and temptation after a life harmonious with the ideal of his art: a life in which genius shall develop uncramped by conventional taste or exigencies of a struggle for bread; in which joy and pain shall be as golden harpstrings for the musician's fingers, and existence another word for devotion and fruition. But the artist finds—what Josquin found; a dilettante world in love with itself, ready to bid Apollo turn lacquey; or what Elisabetha found; a suffering world that will not let the tender woman-heart satisfy itself with song. This leading purpose of *Alcestis*, if I read it aright, is finely brought out; yet the plan of the story is better conceived than managed. The main point of the plot is Josquin as composer helped to the success of his supreme effort by that sacrifice of Elisabetha, to which even the title and the motto point. Yet this climax is hurriedly brought about at the end of the novel, a quantity of detail being compressed into the previous chapters to work up to the grand *coup*, which falls a little flat after all. True as this management may be to the natural order of circumstance, it

is artistically, I think, a mistake. The writer has like the painter to bring out his strongest motive even at sacrifice of detail and surrounding; to exaggerate gloom, like Rembrandt, that light may be more light; and the novel writer, working more artistically than a biographer who honestly records the succession of circumstances, must dwell upon the events that have the highest spiritual significance, thus presenting the story of a life as it would lie in the memory. Moreover from a musical point of view Josquin is too half-and-half a personage; he hovers between composer and virtuoso with an indifference that makes the character ring false. The creative spirit is always *master* in an artist who possesses the divine gift in any high degree, and the burning desire to produce some great work must have shaped and coloured Josquin Dorioz' life much more strongly than appears. Possibly the author of *Alcestis* would imply that absolute freedom and sympathetic surroundings are indispensable to the creative spirit, and so makes the hero feel no overpowering impulse to produce great things until free of dilettante patronage. Yet Haydn and Mozart wrote divinely while in court service, although bound to supply their due share of what Wagner aptly calls "*tafel-musik*." But where artistic power is so abundantly displayed it may seem captious to object to such finely strained failings. If the author of *Alcestis* betrays amateurship it is of the best culture: music does not often obtain so competent a biographer.

Space is barely left to descant upon the delightful studies of character, quite a little gallery of portraiture, or the fresh descriptions of Dresden, which serve as backgrounds for the *dramatis personae*, the quaint nooks of the old town, the "*Boccaccio gardens*" of the villa, or the perfumed salons, like Menzel's pictures of Sans Souci, where stately ladies recline resplendent under the wax lights, and Frederick supremely pipes among his fiddlers. The general reader, on whom the musical motive of the story is perhaps wasted, will yet find plenty to arrest and charm in *Alcestis*. The best compliment to the author may be to express the hope of seeing more work from the same hand in a field so little exhausted as musical romance.

A. D. ATKINSON.

*Snoilsky's Poems. [Sonnetter af Carl Snoilsky.]* Stockholm.

WE have repeatedly had occasion in these columns to regret the poverty of original Swedish literature in our own time. The struggle of modern social life against the art of poetry has nowhere in Europe been more successful than in the Sweden of the last thirty years. It may be said that the poetry of that country has never risen much above mediocre merit; that there has always been something provincial, something local in its character; but at the same time it has had a consistent history, and took a definite national form long before German poetry, for instance, had emerged out of chaos. Wherever there exists a perfected language with a long range of literary traditions, there is always the chance that a world-wide writer may appear, full-fledged, at a moment's notice. No doubt Sweden is yet to have its great poet, no dilettante like Atterbom, no walking gentleman like Tegnér, not even an inspired minstrel of the border like Runeberg, the largest poetical figure at present on the Swedish horizon, but some one like Ohlenschlaeger fifty years ago, or the Norwegian Ibsen now, who will force the literature of his country on the attention of Europe by the sheer power of individual genius.

Carl Snoilsky, let it be confessed at once, is no such gigantic apparition. He must develop in a startling and quite unexpected manner before he can be hailed as the poet of the future. But this thin book of his, a mere

pamphlet of fifty sonnets, claims our attention as being the very best poetical work that we have met with among recent Swedish efforts. Since Runeberg retired and the last spasmodic wails of the Tegnèrian school died away, two representatives of those opposite types have occasionally claimed the public ear. For some years B. E. Malmström gave out at distant intervals those charming pseudo-classical idyls that presented the very best side possible of the Tegnèr influence. From distant Finland, Zachris Topelius, pupil and friend of Runeberg, continued the style of his master without force or originality, but still healthily and freshly. It is now several years since Malmström died, and his elaborately artificial verse, delicate as it is, will fill no place in the history of poetry, while the songs of Topelius become, year by year, more and more out of sympathy with new phases of thought and feeling. It may be that Snoilsky is the Malmström of his day; at all events there is an intellectual freshness and a delicacy of workmanship that has not been met with in Stockholm since the days of Malmström. In the dearth of poets, it seems that by force of these sonnets alone Snoilsky must rise to the first rank among his contemporaries.

These poems are the work of a man, presumably young, who rides on the crest of the intellectual wave of his day. They are surprisingly modern, and realistic to the point of prosiness. The author's aim—quite a new one for a Swede, by the way—is to take a subject that fills public attention at the moment, and to clothe it with Heinesque pathos and a delicate veil of verse, and set it up as a poem. Sometimes he is very successful; sometimes the ugly thing is too strong for him, and leers out unpleasantly through the shadows and the point-lace. For instance, there are four sonnets entitled *La Pétroleuse*, which are intended to convey a vivid satirical picture of the horrors of the French commune, but the effect is clumsy and tame. These four sonnets, too, offer a good example of one of Carl Snoilsky's greatest faults, a tendency to enrich the Swedish language with a mass of foreign words dragged in unchanged. In the first of these, the unfortunate woman is addressed as Lutetia's Venus, and a little lower down we get such rococo forms as *chassepot-kulan* and *petroleum-effekt*. This latter barbarism ends a sonnet, truly a flat and unprofitable close.

But when Carl Snoilsky condescends to write pure Swedish, and to undertake subjects of a genuinely poetical character, he is often very charming. He seems to have read contemporary poetry to some avail; there are not wanting traces of Victor Hugo's influence, and he is a direct disciple of Heine, though not at all in the direction of the latest German writing. Occasionally we ask ourselves if he has not studied Swinburne. He is not a poet of strong objective tendencies, but rather a reflective and cultivated man of letters. He invites us, not to the mountain-tops, but into his park, where among the regular avenues and close-shaven lawns we find flowers from southern lands and statues half hidden in the leaves. In spite of all his would-be realism he is a dreamer, and the best that he can do is to show us a cloud-reflection of the great battles of the modern gods of thought. He sits in his marble portico, with the murmur of the leaves around him, and the birds bring him news of what is stirring in the work-a-day world. This is not great poetry, but it has delicate and valuable qualities of which Sweden may be proud. We hope to see more important works from this new poet, and for the present we are glad to welcome him.

EDMUND W. GOSSE.

#### LITERARY NOTES.

Mr. J. P. White's family have decided to publish (J. Russell Smith), after a delay of five years, the *Lays and Legends of the English Lake Country*, to which he devoted all his leisure

up to his death in 1868. The poems recall Scott when he is least animated and the later stiffer manner of Wordsworth when he lusted after double rhymes; still there are some—e.g. "Pan on Kirkstone," and "Laurels on Lingg Moor"—not without literary value; all have the interest which results from the union of fervour, clearness, and refinement. This refinement is of course quite compatible with the absence of such cultivation as goes with critical insight, of which there is a plentiful lack in the voluminous notes, which however contain some interesting details (especially those to the "Church in the Mountains"); but there is a great deal too much of mere genealogy, and, though this is not the writer's fault, it is too apparent that local tradition has become too confused and incoherent to yield much inspiration. Still, with all its drawbacks, the book is one that a tourist should be glad to find in a Lake Country inn, and perhaps this is all the praise the author would have desired.

Mr. Pearson has become possessed, under circumstances which are not explained, of the original MS. of Coleridge's *Osorio*, rejected by Sheridan in 1797, and "preserved from destruction by one of those strange and unaccountable freaks of chance or fortune which seem little short of miraculous." Such an observation piques a curiosity which it might have been well if possible to gratify; it might have been well also to give a parallel table of the names of the characters in the two editions of the play, as most of them were altered when the play was performed in 1813 at Drury Lane and had a run of twenty nights under the title of *Remorse*. The omission at one point in the cottage scene of the second act has led the editor himself into some confusion, where he says, "Zulimez replaces Maurice, who is only alluded to." Maurice, "the heroic Prince of Orange," is "alluded to" in both forms of the scene, though he is only named in the later, where no confusion could arise between him and the hero's faithful Moresco attendant, who was named Maurice in the first draught of the play. Still it is ungracious to look a gift horse in the mouth, and Mr. Pearson has given us means of instituting a very interesting comparison between Coleridge's work in 1797 and his work in 1812.

In its original form, *Osorio*, like Wordsworth's *Borderers*, written in the same year, manifestly owes its inspiration to Schiller's *Robbers*, though *Osorio* is the more independent and ingenious work of the two. Indeed it is less absurd and more poetical than its original; but after all it is less powerful; moreover the naïveté and simplicity for its own sake in which the self-indulgence of Coleridge at one time out-heroded the austerity of Wordsworth make the diction often tame and once at least ridiculous. Here in their authentic form are the famous lines about "dripping," which were the only reason Sheridan is known to have given for rejecting the play he had encouraged Coleridge to write:—

"Drip! drip! drip! drip!—in such a place as this  
It has nothing else to do but drip! drip! drip!  
I wish it had not dripped upon my torch."

In 1812 Coleridge had become a great religious philosopher, a great dramatic philosopher; he had profited by the plays of Schiller's manhood; he had acquired the "grand style" of the English theatre, the style which Lord Lytton's modesty led him to think had expired with Sheridan Knowles. As might be expected, the additions in *Remorse* are more important and characteristic than the omissions. The only one of consequence beside the well-known foster mother's tale is a spirited but incoherent scene where the inquisitor is captured, but respited until *Osorio* shall have been first despatched. In the published play there are important additions at both ends, intended to *afficher* a spiritual and dramatic purpose; there is a good deal of inflated writing, meant to raise the character of Teresa, the Christian heroine, who is pompously and elaborately withdrawn from the end of the incantation scene; and at all the important crises of the play the writing becomes more laboured and emphatic, and perhaps better suited to the stage.

The *Buda Pest Review* (*Buda pesti Szemle*), Nos. 2, 3, and 4, maintains the character of the first number (see *Academy*, vol. iv. p. 66). A large proportion of the space is given up to English, French, and German books and articles, which are

either analysed at considerable length or simply translated with but slight omissions. Of these we may mention Gregorovius' *Geschichte der Stadt Rom*, Leroy Beaulieu on Napoleon III., Cherbuliez on Lessing, and the *Edinburgh Review* on Grote's *Aristotle*. Among the poetical contributions are what seems a successful version of Burns' *Tam o' Shanter* by Arany and a translation of Tennyson's *Elaine* and *Ginevra* by Szász. We have among the original articles a review of Dóczi's translation of Goethe's *Faust*, in which extreme violence has been done to the genius of the Hungarian language, the translator being in fact a German, who presumes too much on a supposed mastery of Hungarian. Also two excellent historical contributions, one by Pauler (Gyula) on the conspiracy of the Palatine Wesselényi, 1666-1667; another by Szilágyi (Sándor) on the policy pursued by the Turks towards Transylvania, 1657-1686. The notices of Hungarian books are almost uniformly unfavourable; of non-Hungarian books we have intelligent and favourable critiques of Sayous' *Histoire des Hongrois*, and of Szaraniewicz' *Kritische Blicke in die Geschichte der Karpathen Völker* and *Die Hypatios-Chronik als Quellen-Beitrag zur österreichischen Geschichte*.

Professor Fryxell has just published the 41st part of his interminable *Studies in Swedish History*. The first part of this celebrated work appeared in 1823, and consequently it has taken the author exactly half a century to travel from the earliest times down to the year 1770. The new part treats of the intrigues with Russia and Prussia, and the internal struggles between the Moss and Hatt parties at court, under Adolphus Frederick II. (1765-1770).

The eminent Danish antiquary, Professor Warsaae, has just brought out a valuable little treatise, *Russlands og det skandinaviske Nordens Bebyggelse og ældste Kulturforhold*, the object of which is to prove that the earliest culture in the north of Europe came originally from Asia and North Africa, and that the movement of civilization since the beginning of the Stone Age has taken the same north-easterly direction.

We have received what is announced as the first volume of a complete edition of the *Tagebücher* of Fr. v. Gentz, edited by Fraulein L. Assing from the *Nachlass* of Varnhagen v. Ense. It only differs from the volume published twelve years ago, containing the very interesting *Journal politique* kept by the author in 1809 during the negotiations after the battle of Wagram, by the addition of 100 pp. of the Diary (also in French) kept in 1815 at Vienna and Paris, the substance of which is so uninteresting that we can scarcely regret the destruction of the original MSS. for the earlier years, or question the discretion which led Gentz to resolve on the abridgment of the whole. What is now first printed is a mere list of names and social engagements without either personal or historical interest.

The *Nation* (Sep. 11) gives a pleasant account of the ardour with which the students and professors of the "Anderson School of Natural History," newly located on the island of Penikese, have held their first summer session. Besides constant lectures from Prof. Agassiz and other able volunteers, the students (who are of both sexes) have every opportunity for practical work and independent investigation given them by the dredging expeditions of the yacht, lately presented for that purpose to Prof. Agassiz. There is room, we should think, for an institution of a like kind on the English coast.

## Art and Archaeology.

*Guida del Palatino*, compilata da C. L. Visconti e R. A. Lanciani. Roma. 1873.

THIS little work deserves to be better known to scholars and archaeologists in England than appears to be the case. Although its primary object is to serve as a local guide-book to the recent excavations on the Palatine Hill, yet that site is so important, and the discoveries made there of late years

have thrown so much new light on the history of Rome, that a good account of them in any form should meet with immediate attention. The authors are two of the best local antiquaries in Rome. The Cavaliere Visconti, beside his hereditary claims to our regard, has a wide reputation; and Signor Lanciani, his pupil and friend, and secretary to the Archaeological Commission of the Municipality of Rome, makes it his duty to keep constant watch over all excavations and researches—a duty which he performs *con amore*, with remarkable activity and zeal. These two are joint editors of the *Bullettino della Commissione Archeologica Municipale* (*Academy*, vol iv., p. 273).

The work before us is carefully and diligently compiled from the best authorities, and is entitled on the whole to warm praise. It has only one drawback, which is that the authors naturally see everything through the coloured spectacles of the local "Roman traditions," which are merely the conjectures of learned men of a few past generations, who had less opportunity for forming a correct judgment than we now have. The recent excavations themselves have upset many old opinions, and the leading principle of the modern science of archaeology, that of choosing historical types of each period, and comparing the details of all other buildings with such types, has upset several others. The authors before us, excellent antiquaries as they are in many respects, have not yet seen this, but can only run in the old grooves to which they have been accustomed: still, it is only here and there that the work is seriously affected by this failing, and on the whole it is a trustworthy and valuable guide.

They begin in a preliminary advertisement by showing that the whole of the Palatine is now for the first time restored to the public (with the exception of the part covered by the monasteries, which are not *as yet* disturbed), and to point out how much has been done on that ground since 1848. In that year the court of Russia began at the north-west corner by purchasing what was then a vineyard, called the Vigna Nusiner, and making great excavations there, including some of importance under the church of S. Anastasia. Though the search for statues, the discovery of which was the immediate object of the works, was unsuccessful, the Baron Visconti saw the importance of the excavations for historical purposes, and came to an arrangement, by which he gave for the Russian Museum certain duplicate statues from the Museum of the Vatican in exchange for the Vigna Nusiner, which the Russian Government was glad to be rid of.

The ground ready excavated thus became the property of the Pontifical Government, and the Minister of Public Works bought another adjacent vineyard called the Vigna Butteroni, formerly known as the "Vigna del Collegio Inglese," and the Orto Roncioni was now incorporated with it. By this arrangement the whole of the western slopes of the Palatine became the property of the Pope, and were gradually excavated. In 1860 the Farnese Gardens, which occupied about half of the summit of the hill, were purchased of the ex-King of Naples by Napoleon III., and Signor Rosa was appointed to superintend the works. There is reason to believe that they were originally undertaken with the same object as the Russian Government had in view, and that neither the Emperor nor his employé was aware how thoroughly the ground had been searched for statues when the Farnese Gardens were laid out, of which a full account was published by Bianchini in 1726. The great museum of Naples is full of statues found on the Palatine at that time. But as general attention had now been drawn to the historical importance of these excavations, they were continued with much public spirit for ten years, mainly, how-

ever, with the object above mentioned. A museum was built on the Palatine to secure such of the antiquities found as were not worth sending to Paris; and other objects were brought to the Palatine by Signor Rosa, such as sculptured sarcophagi, &c., to form the nucleus of a new museum there.

These excavations brought to light some palaces of the Cæsars, and some of the walls of the Kings, which had been used as foundations for them. To these palaces, belonging to different periods, names are given not always very happily; some it has been found necessary to change, and others are still erroneous. It is now evident that these palaces were great public works, carried on systematically during three centuries by order of the Senate, and only called after the emperor in whose time each part was built. The Emperor Nerva had them inscribed with the words *AEDES PUBLICAE*. What is called "the Palace of Tiberius" is really of the time of Trajan and Hadrian, built on the site of the old *Regia* of the Kings; the true Palace of Tiberius is on the west side towards the *Circus Maximus*. The "Palace of Caligula" is set down at the top of the Palatine, near that of Hadrian, and yet we are distinctly told by contemporary authority (Suetonius, *Caligula*, c. 22) that it was at the bottom, near the *Forum Romanum*, and that the temple of Castor and Pollux, at the south-west corner of the *Forum*, was used as a vestibule to it: indeed, there are considerable remains of it joining on to that temple, together with part of the bridge across the *Forum*. What is called the "Palace of Augustus" (under the *Villa Mills*) is not of the Augustan period, but is a part of the great public building of the time of Domitian. This is clearly shown by reference to the plan, and by the fact that brick stamps of Domitian were found in the walls by Nibby. What is called "the House of the Father of Tiberius" is really the house of Hortensius purchased by Augustus, with the additions made to it by order of the Senate, as recorded by Suetonius (*Octavianus*, c. 72), Dion Cassius (lib. liii. c. 16), and in this part, which was built for state apartments, the beautiful frescoes were found. The great oval reservoir belonging to it, miscalled a *piscina*, is not a filtering-place, but a large cistern, such as Frontinus called a "*Castellum Aquæ*." There are no buildings of the time of Nero on this part of the hill, but his Golden House extended to that part of the Palatine called the *Velia*, and there are remains of it near the *Basilica of Constantine*. The palaces at the south end, with the *Stadium*, are chiefly of the time of Septimius Severus, in the third century. Further details would be scarcely intelligible without the plan attached to this work, which, though better than that published in photography by Signor Rosa, is not altogether so satisfactory as some others we have seen. The work, in this quarter, however, is still going on so rapidly that any plan soon becomes obsolete.

These excavations and researches, which are certainly the most important hitherto undertaken, are chiefly in the *Forum Romanum*, at the point where it touches the foot of the Palatine Hill. The foundations of the round temple of the *Vestal Virgins* have just been discovered at this corner in front of *S. Maria liberatrice*.

JOHN HENRY PARKER.

#### NOTES ON ART.

A statue of our great English potter Thomas Wedgewood has recently been placed in the Institute at Burslem. Mr. Gladstone, in a letter received on the occasion of the unveiling of the statue, tells us that "observation and reflection" have led him to regard Wedgewood "as perhaps the most distinguished individual in the whole history of commerce taken from the

earliest ages." Seldom indeed have the interests of art and trade been so successfully united as by him. Miss Meteyard, his admirers will be glad to hear, is about to publish another volume of autotype reproductions from his choicer and rarer works mostly in the collections of Dr. Sibson, Mr. Roger Smith, and Mr. Bowker.

The *St. Petersburg Journal* states that the Russian Government has determined to establish schools of design in the manufacturing districts of Russia, with the view of spreading the advantages of an artistic education and developing an artistic taste among the artisan classes. These schools are to be founded by the municipalities, merchant corporations, and artistic societies of Russia, but when necessary the Government will materially assist in their foundation, besides according them an annual grant. The classes are to be open free to pupils of every age and condition who know how to read and write, and special classes will be established for girls. The pupils will be furnished with all the materials necessary for their study at the lowest possible charge, and in the case of the poorest even this payment will be remitted. The schools, wherever it is practicable, will be annexed to some art museum or permanent exhibition of artistic models, and each pupil will be allowed not only to visit the museums, but to copy the works they contain. Thus we see that the example set by South Kensington is being followed even in Russia.

An excellent portrait of Faraday, engraved on steel by Jeens from the well-known photograph by Watkins, has been presented to the subscribers to *Nature* with the number for September 18th. It is further promised that this shall be only the first of a long series of portraits of scientific worthies issued in connection with that journal.

Admirers and critics of the works of the last of the great Venetian painters, Paolo Veronese, will find in the number of the *Revue des deux Mondes* for Sept. 1st a critical history and description of some frescoes by him in the *Villa Barbaro*, near Venice. These frescoes have hitherto attracted little notice, but they have been recently carefully cleaned by the present proprietor of the *Villa*, Signor Angelo Giacomelli, and according to the critic of the *Revue* deserve to be reckoned among Veronese's finest decorative works. The most important is a representation of Olympus, with figures of colossal size. Strange to say the gods and goddesses in this painting are not partaking of any sumptuous repast, such as Veronese usually loved to offer to his characters, whether mythological, angelic or divine. Not even Hebe or Ganymede, so far as we can understand, is present to pour out draughts of nectar for the thirsty immortals.

Besides this grand fresco of Olympus, there are in the great hall of the *Villa* eight allegorical figures by Veronese, which are highly praised for their nobility of form, freshness of colour, and fine decorative effect.

The colossal figure of Germania surmounting the Column of Victory recently unveiled at Berlin in commemoration of the battle of Sedan was modelled by Herman Schies, of Wiesbaden. The artist has represented Germania as a winged female figure, holding in her right hand the laurel crown of victory and in her left the German banner with the eagle and iron cross. The figure stands on a pedestal of grey sandstone, at the corners of which are German eagles watching over French trophies. The names of the four principal battles of the late war—Weissenburg, Wörth, Sedan, and Paris—are written beneath, and on the base of the pedestal is a long inscription, besides the names of more than 400 of the Nassau infantry who fell fighting for their country. Herman Schies was a pupil of Hopfgarten in Wiesbaden, and afterwards of Drake in Berlin. His fine figure of Germania in the churchyard of Kirchheimbolanden, in the Palatinate, has been much extolled by German critics, and no doubt led to his being chosen as the sculptor of the great national memorial at Berlin. He has also, it is said, received a commission for another Germania to be set up at Saarbrücken.

The *Portfolio* for September is enriched by a charming little etching by G. Greux from a picture by Theodore Rousseau. The soft brilliancy of execution and the warmth of colour in

this small plate cannot be too highly praised. It was courageous of P. G. Hamerton, admirable etcher though he be, to place an etching of his own beneath it. An article by F. W. Burton on the Castellani Collection in the British Museum is of much use in calling attention to the inestimable value of some of the early Greek sculptures in that collection. The large female head in bronze, the "presiding divinity of the whole," Mr. Burton considers to "stand quite peerless amongst the treasures of Hellenic art at present extant."

In spite of Dr. Julius Meyer's seemingly exhaustive treatise on Antonio Allegri da Correggio originally published in the *Allgemeines Künstler-Lexicon*, and afterwards printed in a separate form, another memoir of the painter has been recently put forth by the Chevalier Quirino Bigi which, says the *Architect*, contains some new facts that entirely contradict all our recently gained knowledge concerning Correggio and his circumstances. These facts have, we are told, been derived from documents found in the archives of Correggio and Parma; but these archives had been well searched before Dr. Meyer wrote, and we can scarcely suppose that they have since then yielded any very abundant harvest of new material.

The town councillors of Lüneburg propose to sell the whole of the valuable and ancient silver plate belonging to the town, which includes work by Benvenuto Cellini and other artists of note; one offer for the purchase of the whole collection has been declined, in the hope, it is said, of larger bids to come from England.

### New Publications.

### Theology.

**Rational Theology and Christian Philosophy in England in the Seventeenth Century.** By John Tulloch, D.D. 2 vols. William Blackwood and Sons, Edinburgh and London. 1872.

FOR varied and intense interest no past century of English history can compare with the seventeenth. The politician, the theologian, and the philosopher alike look back to it as a period of all-important revolution and change; and in these two volumes Dr. Tulloch has given us a study of one of its most significant phases—a phase, the close resemblance of which to our modern Broad Churchism must, as he observes, "strike every attentive reader." "The highest movement of Christian thought," as Dr. Tulloch characterises it, in that

stirring theological era, was neither Anglican nor Puritan in its sympathies, and consequently neither Anglican nor Puritan writers have vouchsafed it much attention. In an age of the fiercest religious controversy it was anti-polemical in its spirit. Its cause was pleaded rather from the study than the pulpit. And at a time when Owen, Baxter, and other divines of the Puritan school were filling the land with folios and quartos, the calmer thinkers to whom we are here introduced—whose more sparing utterance claims comparatively so modest an allotment on the library shelf—were conceiving in a higher atmosphere of thought works in which a generation increasingly weary and neglectful of controversial divinity, may find a literature at once rational, philosophical, and Christian.

The first volume is devoted to a group of "Liberal Churchmen"—comprising Lord Falkland, John Hales of Eton, Chillingworth, Jeremy Taylor, and Stillingfleet. Two introductory chapters—the first on the Spirit of Rational Inquiry in Protestantism, the second on Religious Opinion in England from the Reformation—put us in possession of the author's standpoint, and of his estimate of the relation of his subject to preceding experiences in the Church's history. The generous and cultured spirit in which the Reformation took its rise died out, according to Dr. Tulloch, under the "unhappy influence" of Luther and Calvin; dogmas and confessions multiplied, but inquiry came to a standstill, "arrested by the necessities of the age." A rigid Augustinianism was inculcated at the continental seats of learning, from Louvain to Geneva; and in Germany a noble theological activity degenerated into frivolous dialectical discussions that recalled the puerilities of the old scholasticism. From this state of things Arminianism only represented an inevitable reaction, and it is to the influence of Arminius, together (though in a very secondary degree) with that of Hooker's *Ecclesiastical Polity*, that Dr. Tulloch traces in "all the subsequent development of Protestantism" "a nobler and more comprehensive thoughtfulness and freshening life." Without here calling in question the general accuracy of this representation, we must nevertheless demur to the statement that "historical criticism in the modern sense took its rise in the Arminian school." The honour of initiating the historical method in relation to biblical studies undoubtedly belongs to Erasmus, whose claims to this distinction have been lucidly pointed out in a volume to which Dr. Tulloch more than once refers—Mr. Seebohm's *Oxford Reformers*. Again, it is not very easy to reconcile the statement respecting Tyndale, at p. 40, that "he showed himself in his doctrinal conclusions independent of Augustinianism," with the assertion on the following page that "his leanings were Augustinian, even of a somewhat strong type." The fact really being, that Tyndale, whose doctrinal views were for the most part an echo of those of Luther, was an Augustinian of the most pronounced character.

The sketch of Lucius Cary, Lord Falkland, known to many only as the high-minded and moderate politician, is interesting as exhibiting him in another light, as the centre of a distinguished literary circle, and held by them in such esteem that in Cowley's eulogistic language,—

"— learning would rather choose,  
Her Bodley or her Vatican to lose."

Dr. Tulloch satisfactorily establishes the fact that the honour of educating Falkland belongs to St. John's College, Cambridge, and not to the foundation of the same name at Oxford; from Mr. Forster's theory, that Falkland was privy to the arrest of the Five Members, he altogether dissents; and in the more important question of his political consistency, shows that he throughout pursued an unvarying

middle course between the demands of the Puritans and the aggressions of Anglicanism. Falkland was a liberal Churchman, and, born out of due time, fell the "martyr of moderation." The sketch concludes with an analysis of his *Discourse of the Infallibility of the Church of Rome*, and Falkland needs no higher eulogium than that which describes him as one who, while "shrinking from revolution in Church or State, would have liberalised both, in a truer and nobler sense than his contemporary revolutionists, ecclesiastical or political."

Not less a "martyr of moderation," though in a different fashion, was John Hales of Eton, for whose abilities and learning Bishop Pearson always professed such enthusiastic admiration, the coadjutor of Savile in his learned labours, and author of the famous tract *On Schism*. In the capacity of chaplain to Sir Dudley Carleton, Hales was present at the Synod of Dort, and his letters furnish perhaps the best account of the proceedings of that memorable assembly, to which Dr. Tulloch accordingly devotes a large amount of notice. It seems unquestionable that the Remonstrants on that occasion, notwithstanding the ability and eloquence of their leader Episcopius, were most unfairly used. Hales, shocked and pained beyond measure at what he witnessed, then and there, to use his own expression, "bade John Calvin good night," though, according to Dr. Tulloch, he did not "say good morning to Arminius." For the charge of Socinianism, brought against him by Aubrey, there seems to have been no foundation whatever. Amid the uproar of contending parties, Hales was a dispassionate seeker after truth. "For this," he said, "I have forsaken all hopes, all friends, all desires." His heroism met with the usual reward. When the Revolution came he was driven from his residence at Eton College and from his canonry at Windsor; his poverty compelled him to part even with his library; and he died at Eton, in the house of a widow, whose husband had been his servant, in poverty and obscurity. "A Churchman without narrowness; a friend of authority, who must yet have hated in his heart and deeply felt the folly of Laud's tyranny."

The sketch of Chillingworth is singularly interesting, and the criticism on the *Religion of Protestants* may be looked upon as the best account of the work that has yet appeared. It is no slight testimony to the real candour and honesty of the book, that though undisguisedly hostile to the theories of the Anglican Church, it was formally buried, at the same time as its author, with a series of Puritan anathemas that might compare in spirit, if not in length, with the immortal curse of Bishop Ernulphus.

The relation in which Jeremy Taylor and Stillingfleet, who come next, stand to the Liberal party, is characterised by Dr. Tulloch as "peculiar." Both contributed by a single important work—the former in the *Liberty of Prophecy*, the latter in the *Irenicum*—to the advancement of a movement with which "neither their special reputation nor the prevailing character of their theological activity has identified them."

In the second volume—which is devoted entirely to the Cambridge Platonists—the subject-matter has necessitated both deeper research and severer thinking; "the rational spirit," as the writer says, "broadened, and took to itself larger intellectual elements. It extended beyond the sphere of the Church, into the whole region of spiritual thought and philosophy." Unlike Hales, Chillingworth, and Taylor, the Cambridge Platonists were men who came from the Puritan side, and were all, with the exception of More, educated at the new Puritan foundation of Emmanuel,—Emmanuel, which in the seventeenth century outnumbered St. John's, and both in numbers and reputation was little inferior to Trinity.

In the introductory chapter, on the Historical Position of the Cambridge School, Dr. Tulloch assigns as the chief causes of this remarkable movement, the reaction that set in after the great Calvinistic triumph at the Westminster Assembly,—the philosophic speculation of the age, Baconian as well as Cartesian,—the renewed study of Plato and the Neo-Platonists,—and the instinctive protest evoked by Hobbes' strange apotheosis of external law as the sole and ultimate standard of morality. Of the new school, Whichcote, provost of King's—an appointment made when the Puritans were in the ascendancy, and seeking to remodel the university after their own mind—seems entitled to be regarded as the founder. A man of no great erudition, but of considerable powers of thought, wise, and broad-minded, he exercised as afternoon lecturer at Trinity Church, at a time when sermons ranked somewhat higher in the general estimation, a singular influence over the more thoughtful younger members of the university. It is evident however that Whichcote, like many other men of note in their day, was largely indebted for his popularity to some charm of personal influence and manner which his writings could not transmit. So far at least as his extant performances enable us to judge, he possessed rather a fine appreciation of high thought than original power. His sermons, as known to us, seem to be estimated by Dr. Tulloch somewhat above their deserts; his correspondence with his old college tutor, Tuckney, who remonstrated with him on his novel doctrines in the pulpit, and from which we have here copious extracts, strikes us as somewhat dull; and the "Aphorisms," where not evidently an echo of preceding thinkers, are sensible rather than brilliant. If indeed the sentiment quoted on p. 103,—that "God will not reject malign dispositions which will not be altered and subdued to the temper of heaven,"—is correctly given, it certainly seems no very favourable specimen of his expansive tolerance.

The genius of this Cambridge band was probably John Smith of Queens' (not Queen's, as it is here printed), a thinker "dead ere his prime." With greater originality than Cudworth, and less eccentricity than More, he left behind him nothing but "Discourses," delivered in the college chapel—a volume however which attests the possession of powers of a very uncommon order; and Dr. Tulloch scarcely exaggerates their merits in saying that "an ineffable light of spiritual genius shines in them all." "Powerful and massive in argument, they are," he adds, "everywhere informed by a divine insight which transcends argument. Calmly and closely reasoned, they are at the same time inspired. The breath of a higher, diviner reason animates them all."

Cudworth and More follow next. Dr. Tulloch does not appear to have consulted the unpublished manuscripts of the former at the British Museum, but those whose leisure does not admit of their attempting the perusal of the *Intellectual System of the Universe*, will here find an admirable criticism of that imposing *torso*. The argument is still that which theologians will perhaps always prefer as the most satisfactory reply to the inferences that are supposed to attach to the Darwinian theory.

To the estimate of Henry More, the poet and enthusiast rather than the philosopher, no exception can be taken, unless indeed we are inclined to accuse Dr. Tulloch of too respectful a treatment of the mystic extravagances of the recluse of Christ's College. His statement however that More "nowhere discusses or shows any interest in the doctrinal differences of Calvinism and Arminianism," is not quite correct; for we find in the edition of More's Theological Works, published 1708, that he is at some pains to propound a *media via* between the two doctrines, and plainly

expresses his belief "that whosoever is damned, it is long of himself."

Another brief chapter is devoted to the minor lights of the school, among whom Culverwel, in his treatise *On the Light of Nature*, arrests the attention as a vigorous repudiator of the Platonic doctrine of innate ideas; and this, it is to be observed, in apparently entire independence of Hobbes—whose *Leviathan* came out only one year earlier—and nearly thirty years before the appearance of Locke's *Essay*. In the concluding chapter the position of these illustrious thinkers, in relation to Church policy, is carefully distinguished from that of modern Dissent;—"the latter," says Dr. Tulloch, "by the pressure of its special dogmatisms crushes all further spirit of Christian inquiry, and, within its own pale, or as far as it can, all freedom of thought;" the theory advocated by the former was that of a Church that "had no final element of control except the collective national will."

On reviewing in the aggregate the characteristics of this party, it may be said that its main significance lay in the protest which, in theology yet more than in philosophy, it asserted against the developments of mediævalism. The ancient symbols and confessions, in their opinion, "had no other design but to testify, *not what was to be believed*, but what the authors of them themselves believed." Chillingworth himself declared that, in subscribing the articles of the Church, he intended nothing more than "a general approval of her doctrine,"—he accepted them as "articles of peace." To the mediæval belief in the infallibility of general councils, a belief in which even Luther so largely shared, both John Hales and Jeremy Taylor gave scarcely more countenance than Gregory Nazianzen himself. Falkland, from his seat in the House of Commons, while warmly defending the institution of the episcopal order, distinctly repudiated all notion of their existing *jure divino*. Cudworth, in his treatise *On the Lord's Supper*, not merely rejects the doctrine of the Real Presence, but regards the rite as non-sacrificial and simply commemorative.

On the present value of the literature bequeathed us by this school it would be unwise to insist too strongly. Many of their views have been urged with a sounder erudition, and far more effectively, by the modern representatives of the movement; many of them have been definitely abandoned. But the appearance of such a school, in such an age, is a very interesting and noteworthy phenomenon indeed, and to exhibit it in its true historical relations becomes consequently a matter of paramount importance. But here Dr. Tulloch's treatment appears, to say the least, somewhat defective, inasmuch as he has either passed over with insufficient notice or has altogether neglected certain factors in this notable development of free thought which cannot justly be disregarded.

In the first place, the liberal theology of the Cambridge Platonists was a distinct tradition from the Greek Fathers. It was from the study of writers like Origen and Clemens Alexandrinus that they drew courage to shake off much of mediæval doctrine. For their knowledge of those Fathers they were mainly indebted to the labours of Erasmus—an obligation which Stillingfleet himself recognises so emphatically, and to which he mainly attributes the Reformation. Yet with reference to this source of inspiration Dr. Tulloch is almost altogether silent; and his silence is all the more remarkable in that Dean Stanley—to whom these volumes are very appropriately dedicated—has already drawn attention, in his *Eastern Church*, to the importance and value of the tradition. It seems singular, when we hear so much about Arminius, to miss all reference to these earlier but not less influential thinkers.

Again, looking at this as essentially an academic movement (so far at least as concerns the writers treated of in the second volume), we should have expected a careful study of the points of contrast which it presents to similar preceding efforts. The schoolmen and the Cambridge Platonists had characteristics in common, which seem to call for some examination of those of difference. Both accepted, as a starting point, the truth of Christianity, and both then proceeded to approve it to the reason;—the former rather to the logical faculty, the latter to the understanding. Albertus and Aquinas, not less than Cudworth and More, sought to devise that system of reconciliation of which Occam, like Bacon, despaired. But Dr. Tulloch appears to have started with the assumption that the writers with whom he is concerned had nothing to do with the schoolmen, and that assumption has more than once led him into grave misrepresentation. One instance must suffice. Speaking of Whichcote, he says, "He moves in an ideal and open atmosphere, *unfamiliar to the school-theologian*. Truth is not embodied to him in this or that form of divine assumption, standing apart from the ordinary cycle of human knowledge and experience. Religion does not displace, or supersede, or make an extraneous addition to other truths. It is apprehended as the summit and ideal of all others." In illustration of this statement he quotes from Whichcote's "Aphorisms" the following sentiment: "God hath set up two lights to enlighten us in our way: the light of reason, which is the light of his creation; and the light of Scripture, which is after-revelation from him." Now we have only to turn to the *Summa* of Thomas Aquinas (*Prima Secundae*, quaest. 68, art. 2), and we find these words: "Ratio autem hominis est perfecta dupliciter a Deo; primo quidem naturali perfectione, secundum scilicet lumen naturale rationis; alio autem modo quodam supernaturali perfectione per virtutes theologicas. Et quamvis haec secunda perfectio sit major quam prima, tamen prima perfectio perfectiori modo habetur ab homine quam secunda: nam prima habetur ab homine quasi plena possessio, secunda autem habetur quasi imperfecta." Making use of a beautiful metaphor, the schoolman then adds: "Sol quia est perfecte lucidus, per seipsum potest illuminare; luna autem, in qua est imperfecte natura lucis, non illuminat nisi illuminata." Precisely the same thought is to be found in the third chapter of the *Contra Gentiles*; and in fact it is in every way probable that Whichcote's "aphorism" was nothing more than an unconscious echo of what he had heard of the *Summa*, as expounded in the lecture room.

Finally, while too neglectful of the patristic and scholastic relations of his subject, Dr. Tulloch seems to us to have exaggerated the influences of Arminianism. Long before Arminius the controversy respecting free will had been waged by his fellow countryman, Erasmus, against Luther; and long after Arminius his doctrine was espoused by some of the fiercest opponents of religious freedom. Even among those whose lives and writings Dr. Tulloch has here set before us, two—Falkland and Culverwel—appear to have been as stoutly Calvinistic as any divine in the Westminster Assembly; nor is it to be forgotten that, at the very time this Cambridge movement was at its height, it devolved upon the Calvinistic party on the continent, as represented by Pascal and the Jansenists, to assert the cause of spiritual freedom against the Jesuits, who were Arminian to a man. It must however be admitted that these two volumes contribute materially to the refutation of Buckle's overstrained theory, that the "professors of Calvinism are more likely to acquire habits of independent thinking than those of Arminianism." Meanwhile we note, not altogether with satisfaction, that as in the last century Cambridge was indebted

to Principal Wishart, of Edinburgh, for an effort to preserve the memory of Whichcote, so, in the present day, it is to learning and research across the Tweed that she owes this careful, and in many respects very able, study of perhaps the most brilliant circle of thinkers that the university has known.

J. BASS MULLINGER.

**Ewald's Theology of the Old and New Testament.** [*Die Lehre der Bibel von Gott, oder Theologie des A. und N. B. von H. Ewald.*] First Vol. Doctrine of the word of God. 1871, pp. 474. Second Vol. 1873, pp. 350. Leipzig: Vogel.

PROFESSOR EWALD'S new book is too important to be left unnoticed till it attains its completion. Yet we could wish to have the whole work in our hands before writing any estimate of its value. For the book is as much a system of digested Dogma as a Biblical Theology in the usual sense of the word; or shall we rather say that for our author the modern distinction between Biblical Theology and Dogmatic does not exist. He judges it possible to frame by a single process a harmonious organism of systematic doctrine resting on the Bible, without the intermediate labour of partial inductions which forms the basis of the Biblical Theology of the moderns.

Ewald in truth has never been fond of showing to his readers details of inductive or dialectic analysis. His method of treating history shows a peculiar power better known in another branch of science. It is well known that first-rate genius in mathematics is characterized by the faculty of attaining by an immediate intuitive construction results which other thinkers can reach only by analysis. Ewald's greatest discoveries have been made in the same way; but he has not been always so alive as the mathematicians to the necessity of backing up the intuitions of genius by processes of analytical verification, which are not only more intelligible to most minds, but frequently are the only sure means of detecting the errors of a too bold construction.

When we say that in the volumes before us Prof. Ewald has commenced a gigantic application of his favourite synthetic method to the new and more difficult problem of dogmatic construction, we are far from implying that the work which we are characterizing is one of speculation disjoined from Biblical fact. No man has such a hold of Biblical minutæ as our author, and the present treatise not only rests on the vast mass of observation and combination already laid before the public during fifty years of unparalleled literary activity, but presents us for the first time with a profusion of new and subtle hints and delineations of points of Biblical detail, all worked up into the system with that power of universal absorption which is so characteristic of Ewald's theories. Nothing can be more imposing than this kind of work. Every reader of Ewald's most finished productions—such as his general introduction to Hebrew Poetry—has felt the impress of power pertaining to a treatment of the subject which, beginning apparently with a bare definition, gradually swells out into a rich organic complex, into which every historical fact is successively taken up, apparently without effort or hesitation. But no previous book has given so brilliant an illustration of this power as the "Biblical Theology." Nowhere has the variety of facts been so great, or the organic scheme of thought in which they are comprehended so extensive.

It must be added that so extraordinary a display of intellectual power does not fail to excite some misgivings. We are never thoroughly assured of the soundness of an evolution of thought which is not guided and tested by dialectic, or of the certainty of a combination of observations that has not been checked off by the usual processes of inductive analysis. And our suspicions become graver when the thought developed is so large, and the observed facts to be combined and subsumed under the thought so numerous, as in the present

case. Ewald, no doubt, would urge that the very number of details of Biblical statement which he fits into his construction is a proof of its justice. The natural philosopher has no better test for the correctness of the curve which expresses a new law than the number of observed points that lie on it. But it must not be forgotten that the Biblical phenomena which lie before the theologian are not pure and simple facts; they are both complex in themselves and always more or less coloured by subjective elements of exegesis. No man is so infallible that his exegesis is not in a measure attracted towards his dogmatic prepossessions and *vice versa*, and a very slight displacement of each of a vast number of facts may produce a serious deflection of result which can only be checked off by processes of verification.

As Ewald's generalisations from facts cannot be viewed as secure till they are tested by inductive analysis, so the balance of parts in the organization of his system certainly desiderates sharp dialectic treatment. To our mind this is the main fault of the book. We always expect of Ewald that his generalisations from facts will be instructive even where they are not conclusive; but systematic thought not dialectically developed is either absolutely right or absolutely worthless as *system*. But of strict dialectic Ewald seems incapable. He is ready to offer in its place the richest concrete illustration or historic evolution of his thought. Some of the finest passages in the first volume are in fact long synthetic justifications of thoughts which demand for the purposes of dogmatic an incisive dialectical treatment. The first of the three great questions pertaining to Revelation which our author puts concerns "the essential nature of the Revelation of God's word." This question is answered in an elaborate historical survey of the progress of Revelation from the moment when man first felt the need of converse with God to the fulfilment of all Revelation in Christ. With this survey is inwoven much beautiful thought as to the relation of Revelation to the fear of God and its results in the establishment among men of the highest spiritual fellowship of life and truth. But the whole of this imposing essay, eminently instructive as it is, fails to bring the matter to the point. We are made to feel Revelation, to see it growing in history, to sympathize with it; but we never gain that clear logical statement of its dialectic moments without which the ends of system are not attained.

Nowhere, however, is the lack of dialectic handling more perceptible than where the author proceeds to lay down the divisions of his subject. The truths of Theology presented in the Bible are on the one hand truths to be believed and so form the *Glaubenslehre* (Doctrine of Faith). On the other hand the same truths are the ground of duty, and from this point of view we get the *Pflichtenlehre* (Doctrine of Duties). Once more, since these truths become finally and fully efficacious only in fellowship between God and man, we have, as the third part of the system, the doctrine of the Kingdom of God. Of this division the first two parts are the *fides* and *observantia* of the old Dogmatic; but to the trilogy given by Ewald we can recall no closer analogy than the *quid credas, quid agas, quo teneas* of the Middle Ages. It is certain that the doctrine of the Kingdom of God was unduly neglected in the older systems. But was not the source of this neglect the too narrow conception of Christian Ethic as consisting exclusively of exposition of the moral law? The Kingdom of God is the Christian *Summum Bonum*, the highest moral idea, and so, one imagines, should precede and dominate the doctrine of duty. At any rate Ewald's division is not plainly convincing as it stands, and it is not too much to wish that instead of leaving its justification to the sequel, our author had offered some dialectical vindication of its completeness, instead of simply throwing it out as obviously adequate.

The first volume is not part of the system thus divided. It contains an introductory discussion on the doctrine of the Word of God, and in fact as Ewald puts it, sets before us the way in which the word of God as contained in the Bible appears among men. The whole volume is rich in thought and is, we think, both from its subject and its form better fitted to be popular and useful in an English translation than almost any other of Ewald's books. It would be injustice however to attempt to give within our brief limits any outline of discussions which obstinately refuse to be divided into heads. Some idea of the volume may perhaps be conveyed by saying that it is in great part a sort of *historico-psychology* of Revelation. (Comp. *Academy*, vol. ii., p. 535.)

The second volume\* commences the system proper, and takes up the doctrine of God, as the first part of the *Glaubenslehre*. It is obvious that the whole work must extend to a considerable size. And it must be taken along with parts of the author's *History of Israel*. But for the discussions of the History of Biblical ideas in that book, Professor Ewald would have thought it necessary to append to the system a purely historical section.

The doctrine of God, which is to be followed by the doctrines of the Universe and of Man, is approached by a discussion of Spirit; for though a fixed notion of God was earlier developed than the notion of Spirit, the immediate knowledge of God's Being comes most clearly through the knowledge of what Spirit is, and the God of the Bible is in the very earliest times a God who is Spirit (not *a* Spirit). Spirit is that energy of unseen life behind the world of sense which man first learns to recognise on the analogy of his own psychical experience; and in this unseen region the one unchanging, all-creating, sanctifying Spirit of God appears in contrast to the ever varying, waxing, and decaying multiplicity of human Spirits.

The next great question is the personality of God—the fundamental truth of personal religion that He presents himself as *Thou* to *me*. The personal God of the Bible is not an arbitrary being—not even in Exodus xxxiii. 19. He is a wonder-worker, for he is infinite; but in all things is *one* and unchangeable, whether considered in his inner essence as Spirit, or in his outer essence (the *Way*) as Love.

Our author next passes on to the three main truths, that God is Spirit, Love, and One. Under the first head we have a historical survey of the battle fought by the doctrine that God is Spirit during the whole course of the Bible history. Then are enumerated the individual points in which God's Spirituality becomes significant to us. On the one hand God is Creator, Eternal, Unchangeable—on the other All-present, All-knowing, All-working. In this part of the work we would specially mention the discussion of Theophany, the remarks on the notion of Heaven as God's dwelling-place, and the exposition of the notion of a miracle.

Love, says Ewald, is the instinct of spirit to direct its inclination and force to a definite object. God then, who has no needs, acts from pure love. This leads to discussion of God as good and as Father. Next comes the subject of the outgoings of Love, from which is deduced the doctrine of God's Wrath and Jealousy. In this connexion we have an elaborate and important discussion of the addition to the Second Commandment, after which follow various considerations as to the relations of God's Righteousness, Wisdom, Longsuffering, &c. Finally God's eternal love gives rise to

his Faithfulness. But the most comprehensive name for all that belongs to this head is God's Holiness. The unity of God considered internally implies his Perfection, Loftiness, and Blessedness. On the other hand, God as one is also the only God and the true God. To these considerations is attached a most important essay on the world of Spirits—Angelology—and another on the names of God, which contains considerable additions of detail to what Ewald has formerly written on this head.

It has scarcely been possible for us to show how many points are touched in this volume. All remarks on detail must be reserved for a second paper, in which we propose to discuss some individual points of interest.

W. ROBERTSON SMITH.

### Intelligence.

The new Commentary on Proverbs by Dr. Delitzsch is most elaborate and thorough, extending to upwards of 500 clearly printed pages, and saturated, as one might anticipate, with rabbinical and other learning. No difficulty is overlooked, or treated in a superficial or cursory manner. The exposition, also, is characterized by perfect fairness, and a sincere desire to elicit in each case the thought to which the sacred writer intended to give expression. Though very decidedly conservative, the author, as is known, does not hesitate to depart from traditional views, when he cannot honestly maintain them critically. Thus, he assigns the authorship of the first nine chapters, not to Solomon, but to an unknown writer of the age of Jehoshaphat. And he ventures occasionally to suggest or approve emendations of the traditional text, though not so often as would seem to be necessary. The faults of the Commentary are principally those of excess. Its value and usefulness would have been increased by abridgment. Many of the grammatical explanations might have been omitted. And the remarks as to the radical meaning of words are occasionally more curious than instructive. Thus, it does not help us to understand i. 13 and iii. 9, to be informed that etymologically *וְיָרָא* denotes "Schwerwiegende Habe die das Leben leicht macht," and *וְיָרָא* "fac Jovam gravem de levitate tua." The author, indeed, from his long familiarity with rabbinical writings, seems to have contracted not a little of the rabbinical spirit. But faults such as these do not detract materially from the value of a work which is otherwise calculated to be so useful to the student.

Mr. Elzas, whose handy edition of the Book of Job we noticed some time ago (*Academy*, vol. iii., p. 430), has brought out through Messrs. Trübner the first volume of a work on the Minor Prophets, executed on a similar plan. It will be found useful by less advanced students. The illustrative notes leave comparatively little to be wished, but the author's acquaintance with modern criticism is limited.

We have been favoured with the sight of an unpublished pamphlet of great interest to Biblical critics, by Bishop Colenso. It consists of three parts: i. The Age of the Elohist narrative in Genesis—a detailed answer to the essay of Dr. Koster in the *Theologische Tijdschrift*, to which reference has already been made in these pages; ii. A Comparison of the language of the Deuteronomist with that of Jeremiah; iii. The Age of the 68th Psalm—a fragment of part vii. of the Bishop's great work, which is now in the press. Prehxed are some brief answers to the criticisms of English reviews, including our own, from one of which we learn with interest that the Bishop has been convinced by Dr. Oort that the prophecy of Joel must be set (as a whole?) in the age of Zedekiah.

### Contents of the Journals.

*Vierteljahrsschrift für deutsch- und englisch-theologische Forschung* (ed. Heidenheim), vol. iv. No. 3.—Assyrian Researches; by A. Scheuchzer, Conclusion, with lithograph. [Asiatic history in the light of the Egyptian monuments.]—The Samaritan chronicle of the High Priest Eleazar (11th cent.), and [Samaritan] Prayers of the High Priest Amram; by Editor. [The former from a Bodleian, the latter from a Vatican MS.]—No. 4.—Jewish interpretations of the Psalms; by Editor. [Extracts from the Midrash Tehillim, translated; chiefly valuable for the history of exegesis.]—Criticisms on the text of the Proverbs. [Valuable; should be read with Lagarde's *Anmerkungen zur griech. Uebersetzung*, Leipzig, 1863.]—The Christology of the Karaites [Containing a remarkable Karaitic testimony to "Jesus of Nazareth, a great sage, a righteous and pious man," whose teaching is represented as opposed to that of his followers], and A Samaritan Prayer [illustration of Samaritan angelology and astrology]; by Editor.—Vol. v. Nos. 1 and 2.—Criticism of the text of the Epistle to the Romans, and The Christology of the Samaritans; by Editor. [The former, an attempt to show that our present text of Romans is probably a translation from the Aramaic, and not free from errors, e.g. in i. 17, 19, ii. 16, 20, iii. 31, iv. 18, v. 6, 7, vi. 23,

\* The second volume contains a good deal of preliminary matter, in which the perhaps most interesting point is the defence of the attempt to find a single, consistent, though gradually developing, scheme of doctrine in Scripture.

### Physical Science.

▲ **General System of Botany**, descriptive and analytical. By Em. Le Maout and J. Decaisne. Translated by Mrs. Hooker. Rearranged with additions by J. D. Hooker, C.B., M.D. Longmans, Green, & Co., London.

Of the original authors of this remarkable book Le Maout is best known for his *Leçons élémentaires de Botanique*, which is an excellent example of clear and attractive exposition, while Decaisne has long held a chief place amongst living analytical botanists. It was in every way worthy of its distinguished authors. Taking into consideration the comprehensiveness of the plan, the moderate price (the English edition is two and a half times as costly), and the profusion of the illustrations, of which there are no less than 5,500, executed with all the characteristic excellences of French draughtsmanship, probably few scientific books have ever been published which there was more satisfaction in possessing. One especial merit is the comparatively large space given to the lower or Cryptogamic plants. Nothing is more striking in comparing the general plan of a book on systematic zoology with one on systematic botany than the disproportionate space which is usually occupied in the latter by the higher organisms to the exclusion of the lower. Here the apportionment is more equitable even if it is still far from adequate. There is no doubt a certain amount of apparent reasonableness in the fuller treatment which is always given to flowering as compared with flowerless plants. Everywhere the former dominate over the latter, and if they receive more than their due share of attention we may admit that they never fail to claim it. From the point of view however of the student of general biology every form of life requires a careful study, and the extent to which each is re-

presented in the field of nature does not concern him but only the systematist. The present work however is quite indispensable to all students of general biology, as none other at present existing, except perhaps Schnizlein's *Iconographia* which is more costly and far less convenient, contains anything like as much information about the different plans of organisation included in the vegetable kingdom.

Comparing the two editions, we find that the principal change in the English one is in the sequence of the orders of flowering plants. The original authors adopted that of Adrien de Jussieu, which has not, however, been much used. It places at the top of the series the *Monopetalae*, concluding with the highly consolidated *Compositae*. Amongst all systematists who admit the doctrine of descent this is accepted as their proper position in any arrangement based upon it. But no linear sequence can ever be properly adjusted to represent genetic affinities. The Candollean, which is adopted in the present edition, though no doubt in principle artificial, is very convenient for purposes of instruction, and inasmuch as a vast body of current botanical literature is adapted to it, no attempt should be made to discard it for purposes in which it is necessary to use some sequence, until to continue to do so actually stands in the way of scientific progress. Dr. Hooker does not see his way to improve on De Candolle's arrangement, "which places *Monopetalae* in the centre of the series, flanked on either side by *Polypetalae* and *Incompletæ*, which have many cross affinities, but have few affinities of any consequence with *Monopetalae*" (p. 994). Mr. Bentham and Dr. Hooker have also employed it in their *Genera Plantarum*, a work of enormous labour still in progress, and which will for a long future to come be regarded as a digest of modern Phanerogamic Botany. They have introduced into it, however, some modifications which are also employed in the present work. The most important of these is the intercalation between the manifestly perigynous and hypogynous orders of a new series, *Disciflorae*, characterized by a highly developed stamiferous disk. The object is to provide a receptacle for those orders, which it required some violence to group with either *Thalamiflorae* or *Calyciflorae*. If the use of such a structure as the disk for classificatory purposes is not without its difficulties, it must be remembered that it hardly claims any higher recommendation than that of expediency. Many orders are allowed to retain their full rank in the present work which in the *Genera* are reduced, but this, as is here pointed out, in a book of this kind is not without its advantage in allowing their distinctive morphological peculiarities to be more fully treated. It is interesting to get indications here of the views which will be ultimately adopted by the authors of the *Genera Plantarum* as to the position of the orders which the published portions of that work have not at present reached. Without going the length of Strasburger it may however perhaps be regretted that Gymnosperms are not definitely separated from angiospermous Phanerogams. With regard to the Monocotyledons, which have been very much neglected by systematists, Dr. Hooker has effected in this book a good deal towards a more rational settlement of their classification.

While a linear sequence is maintained at all it seems hardly worth while to attempt materially to adapt it to the theory of descent. Every such system must be of necessity more or less artificial, since it aims at expressing relations which are extremely complex in terms, if one may say so, of a single variable. It of course continually breaks down; a greater measure of success will reward any attempt to express these relations by employing some sort of chart; but their fullest expression would only be satisfied by the use of space of three dimensions. Dr. Hooker, in an extremely suggestive although very brief essay on classification given as part of an

appendix, compares the relations of some of the larger groups of plants to those of parti-coloured beads in a necklace which touch at similarly coloured points of their surface. "The position of each bead in the necklace is determined by the predominance of colours common to itself and those nearest to it." Robert Brown, whose labours chiefly consisted in the important work of determining the proper limits of Jussieu's orders, expressed himself as altogether indifferent about arranging these into a series, "*ipsa natura enim, corpora organica reticulatim potius quam catenatim connectens, talem vix agnoverit.*" (*Prodr. Flor. Nov. Holl.*, p. v.) Linnaeus was equally aware that a linear arrangement was insufficient. "*Plantae omnes utrinque affinitatem monstrant uti territorium in mappa geographica*" (*Phil. Bot.* 77). Such a map Giseke attempted to give in the *Praelectiones* which he published (1792) after Linnaeus' death. A diagram on the same principle constructed by Prof. Huxley for the animal kingdom may be seen in Spencer's *Principles of Biology*, i. 303. For plants, at any rate, this will be found probably to be both more convenient, and to involve less actual assumption than the "stammbaum" which is the delight of German Darwinians. In point of fact such a chart is an orthographic projection of the stammbaum not flattened out upon a page like a herbarium specimen, but fully expanded on all sides and seen as we may picture it in our imagination in a bird's eye view from above. In such a view of it, to quote from the address recently delivered by Mr. Bentham to the Linnaean Society: "We should have the present races represented by countless branches forming the flat topped summit of the Dicotyledonous tree—a hundred to a hundred and fifty thousand perhaps, if we take into account species only.....; the branches which immediately bore their present branchlets, as well as the lower more general ramifications, will have wholly disappeared from our view, or left only here or there the most fragmentary traces; and the surviving branches themselves will be most irregularly placed. Here we should see thousands crowded into compact patches definitely circumscribed at every point (*Compositae, Orchideae, Gramineae, &c.*); then we should meet with enormous gaps, either quite unoccupied or a few solitary branchlets or small clusters isolated in the middle (*Moringa, Aristolochia, Nepenthes, &c.*)" (*Proc. Linn. Soc.* 1872-3, xx.) To Professor Flower I think we also owe a striking interpretation of the meaning of such a chart. He conceives the genealogical tree not bounded by the periphery of the present, but stretching away its vigorous shoots into the unseen future. The horizon of to-day intersects limbs and branches and twigs, and the mutual relations of their intersections upon its plane may be represented upon a chart in a manner which allows everything which can certainly be determined as to genetic affinity to be expressed with the least possible amount of assumption. Charts for other horizons in the past might be constructed, down to that primordial one which intersects only the first stem of all. Twigs at one level which have been but just given off will leave their "trace" upon the intersecting plane close to that of the parent branch. In planes of a higher level these twigs will have diverged farther, increased in size, and become themselves centres about which the "traces" of another order of twigs are grouped. These groups will themselves fall into larger compound groups, the whole corresponding to the different grades of ramification of some great bough given off below. One set will represent orders, and these themselves will form aggregates such as Lindley endeavoured unsuccessfully to express by his "alliances." Mr. Bentham and Dr. Hooker have also attempted something in the direction of this integration, if one may call it so, of the vegetable kingdom by arranging the orders into "cohorts."

We are only at the present time beginning to obtain a clear view of the proper scientific position which the labours of systematists and methodizers are entitled to hold. Even Mr. Mill, who brought to his philosophical studies a competent knowledge at least of general botany, failed to attain a clear grasp of the rational ends of classificatory science. He defines the general problem of classification to consist in providing "that things shall be thought of in such groups and these groups in such an order as will best contribute to the remembrance and ascertainment of their laws." This is quite sufficient to include modern ideas of classification, but Mr. Mill takes a much more contracted view of the matter when he lays it down that, in studying objects for the sake of extending our knowledge of the whole of their properties and relations, we must consider as the most important attributes those which would most impress the attention of a spectator who knew all their properties but was not specially interested in any. Such an individual might be perfectly uninfluenced by particular scientific views of the value of diagnostic characters, but he would on the other hand be almost certain to seize upon those characters which a more extended study would show to be really of only superficial importance. He would no doubt, for example, sanction the group of Rhizanth in which the Balanophoraceae are associated with the Rafflesiaceae, an order with which, as Dr. Hooker has pointed out, they have no real affinity whatever. When Mr. Mill advocates the claims of a classification based upon differences in the internal integuments as obviating the absurdity of having to kill an animal to determine its species and genus, he ignores (although he admits that a natural classification must be founded in the main on internal structure) the true aims of classification. For a classification should be the expression of our most complete knowledge, and this cannot be hampered by considerations of absurdity. Mr. Mill does not comment upon the absurdity of having to destroy a flower—as he must often have done—in order to determine the true classificatory position of the plant to which it belongs, or of having to sacrifice part of a mineral in order to ascertain its nature. And though he sees clearly enough that the Linnaean classification by compelling us to think of plants in groups determined by unimportant characters has, by preventing our thinking of them in the connections which would be most suggestive, a mischievous effect upon our habits of thought, he does not allow himself to see that to think of animals in groups determined by integumentary characters is likely to be just as harmful.

The systematists who were antecedent to the influence of modern doctrines of descent were content to extricate from amidst relatively unimportant but often extremely confusing adaptive modifications the genuine points of resemblance in an organism which sufficed to fix its systematic position. Classificatory science was little more than an intellectual exercise which presented problems of no small difficulty but not without interest. So far it was an end in itself. At the most it registered the resemblances of living things and enabled general propositions to be framed about them. But as Mr. Darwin has hinted, it seems to have been sometimes in the minds of systematists that something more underlay our classification than mere resemblance. "I believe," he says, in his *Origin of Species*, "that something more is included, and that propinquity of descent—the only known cause of the similarity of organic beings—is the bond, hidden as it is by various degrees of modification, which is partially revealed to us by our classification" (4th edition, p. 489). This sentence marked a revolution in its study. And there was this advantage, that the new régime was able peacefully to enter into all the possessions of the old. For in proportion as resemblance in

organisms had been critically ascertained, their propinquity of descent had been ascertained also. Classificatory science had hitherto occupied itself with attempting to determine affinities by an analysis of characters from without. It now calls to its aid in unravelling the threads of the evolution of forms of life, the study of development which aids in determining affinities from within; and it checks its results—for with present knowledge it can hardly do more—by the facts of geographical and stratigraphical distribution.

It is only right to do justice to the difficulties which beset the labours of the early systematists. We are too apt to imperfectly appreciate their work, and to forget its continuity with our own. As Linnaeus observed, "videbant quidem veteres esse ordinem in natura qui consistit in rerum similitudine at similia combinare et dissimilia discernere non poterant." (*Praelect.* 2.) Tragus was the first (1560) to attempt any sort of botanical classification, and this was natural in its method. But the want of knowledge of the relative value of characters long stood in the way of both Tragus and his successors. Even as late as the close of the seventeenth century, a naturalist so philosophical as Ray was still blind to the utter absence of any classificatory significance in the herbaceous, fruticose, and arborescent habits of plants. He retained divisions founded upon them in his *Historia*, "et rompt ainsi," as Mirbel remarks "d'un trait de plume une multitude de rapports naturels." Linnaeus (and it is upon achievements of this kind that his true position as a naturalist depends) made an immense advance in determining the subordination of characters. This enabled him to group species into genera upon principles which to this day need little revision. But beyond this—to combine genera into larger groups or orders he found himself unequal. He saw by the intuition which is the possession of every great naturalist glimpses, but still nothing more than glimpses, of how it might be done. In the meantime he devised his artificial system, for which he claimed no higher value than that of utility. "Methodus artificialis sola valet in diagnosi." He thought that the time had not come for the maturation of a truly natural method. "Qui loco methodi naturalis disponunt plantas secundum ejus fragmenta respuuntque artificialem, videntur mihi iis similes qui commodam et fornicatam domum evertunt, inque ejus locum reaedificant aliam sed tectum forniciis conficere non valent" (*Gen. Plant.* ed. 6). But his great ambition was always to substitute a natural method for his artificial one, and his thoughts were occupied with the problem to the end of his life. "Diu et ego circa methodum naturalem inveniendam laboravi, bene multa quae adderem obtinui, perficere non potui, continuaturus dum vixero" (*Classes Plantarum* 485). And it is remarkable that he had some insight into the true meaning of classification. His use of the word affinity was more than metaphorical; it actually implied something like genetic relationship. It is true that he formulated the well-known dictum "species tot numeramus quot diversae formae in principio sunt creatae." Nevertheless he believed that these species were genetically related to genera and orders, though not, it is true, in the way which is now accepted. Creation proceeded from the universal to the particular; orders gave birth to genera, and genera to species. "Supponendum plantas, quae ex ordinum miscela provenire id est genera ejusdem ordinis iterum inter se misceri; tunc oriuntur species" (*Praelect.* 18). To us this seems merely mystical and quaint, but nevertheless the essential fact which underlies it is that resemblance and genetic relationship linked themselves together in the mind of Linnaeus, though the age in which he lived was not ready for the full and complete apprehension of the causal connection of the two things.

It is impossible within the limits of this article to review the classification of Cryptogams from the point of view of

genetic relationship. There are grave difficulties in correlating the two series of vascular Cryptogams. It is difficult not to accept the passage pointed out by Hofmeister through *Selaginella* to Gymnosperms and perhaps thence to Phanerogams. But that from *Selaginella* in the opposite direction to Ferns is not so easy, though the interesting discovery by Fankhauser of the mode of reproduction of *Lycopodium* seems to bridge over the interval through *Ophioglossum*. This confirms the relationship which, as Berkeley remarks (*Outlines of Cryptogamic Botany*, p. 549), plainly exists between *Ophioglossaceae* and Clubmosses through *Rhizoglossum* and *Phylloglossum*.

The biologist will one day reap the full result of the labour of the systematist. When all known plants are marshalled by their laboriously ascertained affinities, when the facts of distribution in time and space have given indications of how and where the tide of life has ebbed and flowed on the earth's surface with currents and waves of migrating forms, it will begin to be possible to see clearly the genetic relationship of all these forms and to trace back the streams of life to their common source. "To prove," says Dr. Hooker, "that affinities are genetic and real is one of the deepest problems of nature, the solution of which is to be arrived at through the patient labour of the anatomist and experimenter, which alone can reveal the philosophy of classification" (p. 994).

W. T. THISELTON DYER.

### Notes on Scientific Work.

#### Chemistry.

At the meeting of the *Association Française pour l'Avancement des Sciences* held last month at Lyons several papers of great chemical interest were read. M. Gautier described a new derivative of glucose,  $C_{12}H_{22}O_{11}$  which he obtained by the action of hydrochloric acid gas at  $0^\circ$  on an alcoholic solution of the above body. After these substances have remained in contact at this temperature for twenty-four hours, the liquid is evaporated in vacuo, and the residue, after having been washed with ether, is treated with baryta and repeatedly crystallised from absolute alcohol. The new compound is a white, solid, deliquescent mass which cannot be fermented and reduces the copper solution. It is formed by the union of two molecules of glucose with elimination of water. It is not an ether of glucose, but probably of that class of derivatives from aldehydes to which Wurtz gives the name of aldol. The name of glycadane has been proposed for it by M. Gautier, that of aldane having been suggested by M. Riban to denote such compounds as furnish aldehydes when they undergo condensation and eliminate water. Glucose, according to M. Gautier, behaves more like an aldehyde than an alcohol. M. Wurtz considers that Gautier's discovery must throw light on the constitution of glucose and explain its double function of a pentatomic alcohol and an aldehyde.—M. Carnot announces the existence in Corréze of native bismuth along with the oxide and sulphide. The most abundant mineral is the oxide containing about 70 per cent. of the metal. The latter is obtained by dissolving the ore in hydrochloric acid and then precipitating the bismuth with bars of iron. Closely associated with it are wulfenite, scheelite, and mispickel.—M. Friedel described some minerals rich in tellurium from Asia Minor. One species consists of a telluride of gold and silver, containing 21 per cent. of the former and 37 per cent. of the latter metal. Telluride of lead was also met with.—M. Grimaux has proposed for the glycerine,  $C_3H_7O_3$ , formed by the action of water on dibromhydrin the name of stycerine. It comports itself with formic acid like a polyatomic alcohol in setting carbonic acid free.

**The New Saxon Uranium Minerals.**—The remarkable group of uranium minerals, which were found in the Weisser Hirsch Mine at Schneeberg in 1871, were submitted to a very careful examination as regards their mineral characters by Prof. Weissbach, of Freiberg, and more recently have been analysed by Dr. Winkler, whose paper appears in the *Journal für Prakt. Chem.*, Band 7, Heft 1. Uranosphacrite occurs in brick-red hemispherical masses which decrepitate when heated and break up into acicular crystals with a silky lustre and brown colour. This mineral has the formula  $Bi_2O_3, 2U_2O_3 + 3H_2O$ . Walpurgine when heated to visible redness becomes of a brown colour which on cooling changes to orange; it is a double arsenate of the following constitution:

Trögerite has a yellow colour which changes by heat to a golden

brown and by cooling to a yellow differing somewhat from the original hue. That which has been heated breaks up when moistened with water into small lustrous plates, and a slight development of heat is observed. Its composition is  $3 \text{U}_2\text{O}_3, \text{As}_2\text{O}_5 + 12 \text{H}_2\text{O}$ . Zeunerite occurs in fine green pyramidal crystals, which bear a very great resemblance to torberite, and have the formula  $\text{CuO}, 2 \text{U}_2\text{O}_3, \text{As}_2\text{O}_5 + 8 \text{H}_2\text{O}$ , or that of torberite with the phosphoric acid replaced by arsenic acid. This discovery led the author to examine the beautiful and characteristic chalcocite of Redruth for arsenic acid, and he found more than three per cent. of that acid replacing phosphoric acid. It is interesting to note that at the Wolfgang Maassen Mine, distant about half an hour from the source of the zeunerite, copper uranite occurs which is free from arsenic. Uranospinite has a pale siskin-green colour, is met with only in very small amount, and has the composition  $\text{CaO}, 2 \text{U}_2\text{O}_3, \text{As}_2\text{O}_5 + 8 \text{H}_2\text{O}$ . The lime uranite of Falkenstein was next examined for arsenic acid and found to contain phosphoric acid only. The author in conclusion describes some experiments by which he succeeded in forming zeunerite and uranospinite artificially in crystalline plates.

**The Determination of Nitrogen in Albuminoid Substances.** A very laborious research has been conducted by Prof. J. Seegen and Dr. J. Nowak (*Pflüger's Archiv*, Band 7) on the surest method of estimating nitrogen in this class of organic bodies, and has led to very important results. They have made altogether nearly forty analyses of albumin, casein, gluten, fibrin, syntonin, legumin and desiccated meat of three kinds, by the two well-known methods, that of Will and Varrentrapp (with and without the use of sugar) and that of Dumas. To avoid the common error of too high a number in the latter process resulting from an imperfect expulsion of the air, they pass carbonic acid for several hours through the combustion tube before heat is applied. They found in every case that combustion with soda-lime gives a lower number than that obtained when the substance under examination is burnt with copper oxide and the volume of nitrogen measured. The discrepancy between the numbers given by the two methods is not the same for each albuminoid substance analysed. It is greatest in the case of albumen, where it amounts to 3.4—3.5 per cent., or more than 20 per cent. of the entire nitrogen, and is least in that of fibrin, where it is 0.7—1.1 per cent. In the analyses of most of the above-mentioned bodies the difference in the number given by the two processes was about 1.5 per cent. or 10 per cent. of the total nitrogen. In the results of the analyses of the meat specimens the disparity amounted to 1.7—2.6 per cent. A considerable portion then of the nitrogen of these substances is not expelled in the form of ammonia by burning with soda-lime. That the use of sugar assists the development of ammonia and consequently raises the analytical percentage has long been known. The authors find that a moderate addition of sugar causes no material increase, and that a quantity at least ten times that of the substance under examination has to be taken to give a number at all approximating to the right one, while twelve to sixteen times the amount of sugar still gives a number short of that obtained by Dumas' method of analysis.

**Triferrous Phosphide.**—This compound has been prepared by R. Schenk (*Jour. Chem. Soc.*, August and September, 1873, 826) by the action of phosphoretted hydrogen on ferrous sulphate. It is a black magnetic powder which dissolves slowly in acids, either concentrated or dilute, with evolution of phosphoretted hydrogen and hydrogen. When freshly prepared and dry it ignites below  $100^\circ$ . Analysis gave numbers which accord with the formula  $\text{Fe}_3 \text{P}_2$ . It is interesting to trace as regards its power of resisting the action of acid a resemblance between this compound and the metallic phosphides of meteorites.

**Jeypoorite.**—A paper by Major Ross on a mineral of this name, from the Khetree copper mines of Jeypoor, in Rajpootana, has been communicated to the Royal Society by Prof. W. H. Miller, the Foreign Secretary, and appears in the *Proceedings*, vol. xxi., No. 144. Twice in this paper Major Ross states that the mineral contains 82 per cent. of oxide of cobalt and curiously enough he twice also tells us that it contains 82 per cent. of cobalt as metal. He gives moreover a complete percentage analysis of the mineral, in which he estimates the whole of each of the three constituent metals to be combined with oxygen, yet there is present, over and above the oxygen, 5 per cent. of sulphur which it is difficult to believe could likewise be in combination with any one of them. He describes this mineral as "a Sulph-antimonial Arsenide of cobalt," a name which signifies a compound of sulphide of cobalt with sulphides of antimony and arsenic, although according to his own analysis Jeypoorite contains altogether over twenty per cent. of oxygen. It will not a little astonish any mineralogist who may peruse this paper to find that these crystals described as "metallic" contain more than one-fifth their weight of oxygen.

The current number of *Silliman's Journal* contains a translation of Prof. vom Rath's obituary notice of Gustav Rose.

#### Geology.

**The Ancient Glacier of the Aubrac Mountains, Lozère, France.**—M. G. Fabre communicates to the French Academy of Sciences (*Comptes Rendus* vol. 77, p. 495), a note on the existence in the quaternary epoch of a great glacier in the Aubrac Mountains, Lozère,

France. These mountains constitute an extensive slightly undulating granitic plateau with a mean height of 1,200 metres; Mounts Dore, Cantal, and Lozère, upon which traces of ancient glaciers had been already observed, attaining an altitude of over 1,700 metres. The Aubracs are drained on the north side by the river Bès, the lower part of the basin of which forms a large cirque. All the low granitic plateaus of the communes of Marchastel, Nashinals, and Recoules d'Aubrac are covered with an unbroken sheet of hardened argillaceous mud enclosing striated and polished blocks of basalt. This is the *moraine profonde* of the great Bès glacier. Between Nashinals and the bridge of Recoules, the parish road traverses a very thick deposit of moraine matter entirely hiding the subjacent granite. Near the hamlet of Congoussac are two blocks of basalt, each more than two metres in diameter, perched upon the summit of a *mountainned* boss of granite. These blocks accompanied by a multitude of basaltic pebbles, more or less angular and often striated, form part of a long train of erratics extending from Gramon to Escudrières. All the basalt was detached and brought from the Peyrou mountain, a distance of 26 kilometres. The departmental road is cut through the right lateral moraine for a distance of four kilometres, and exhibits the basaltic and granitic pebbles enclosed in a hard grey argillaceous mud from five to six metres in thickness. At the time of its greatest extension the Bès glacier sent off a branch to the valley of Sinières. One of the lateral moraines of this branch has been exposed for a length of 1,200 metres, and the terminal moraine forms at Moulins de Sinières a barrier across the valley 20 metres in height. This glacier affords additional evidence of the universality of the great phenomena of the quaternary epoch.

**The Trachytes of Hungary and Transylvania.**—Dr. C. Doelter, who has recently visited Tokay and Eperies, gives in a letter to Prof. G. Leonhard (*Neues Jahrbuch für Mineralogie*, 1873, part iv., 397) a sketch of his examination of the augite and hornblende andesites which break through the rhyolites of that district. The augite andesite, which is extensively distributed through the Hungarian and Transylvanian trachytes, is here compact, and of a black colour, the ground-mass being often glassy like pitchstone. The felspar is in a fine state of division and only to be recognised with the naked eye in weathered specimens. Under the microscope augite is seen to be a constant constituent, hornblende being either entirely wanting or very sparsely distributed. This rock in a decomposed condition constitutes the matrix of the precious opal at Czerventza, and of the common opal at Telkibanya. The hornblende andesites are not so widely distributed. They are mostly compact, with a black ground-mass, small yellowish crystals of felspar and greenish-black hornblende being visible on weathered surfaces, while under the microscope a little augite is sometimes to be discerned. Near Tokay a rock consisting of plagioclase, hornblende, and quartz occurs, which however does not in any way resemble the quartz-trachytes or dacites of Transylvania. A quartz-bearing augite-andesite, hitherto unknown either in Hungary or Transylvania, is also met with here. Northward of Eperies a hornblende-andesite is found containing crystals of a brownish-red garnet. The sanidine-oligoclase-trachyte of Zirkel and Roth pass into the sanidine trachyte here and therefore form no special division. Doelter is of opinion that it is unwise to attempt to classify these rocks until they have received a more extended mineralogical and chemical investigation.

**The Volcano at Climbach near Giessen.**—After a careful survey of the Aspenkippel, at Climbach, near Giessen, Dr. A. Streng and K. Zöppritz have arrived at the conclusion that it is a true volcano which was in full activity towards the close of the tertiary period. It lies on the western border of the basalt sheet which spreads from the Vogelsgebirge to the Lahn valley, and probably contributed to this great outflow. The basalt directly overlies the oligocene and miocene in places. The basalt of the vicinity of Climbach is represented by tuffs and slaggy breccias, and the former are covered with a well defined deposit characterised by the presence of fragments of basalt and layers of dysodile, probably of quaternary origin. The basalt is dark blue or black and encloses small crystals of olivine and augite. Under the microscope it is seen to consist of a very fine ground-mass enclosing large clear crystals of unaltered olivine, a granular aggregate of this mineral, crystals of a plagioclase felspar and augite, while some colourless portions appear to be filled with an amorphous or vitreous material. A vesicular basalt of a brownish or clear grey colour, much decomposed, is met with on the south side of the crater, the slaggy breccia being found in large masses on the east side. The latter consists of fragments of basalt and Bunter sandstone cemented together by the tuff, and sometimes enclosing an amorphous brown mineral in appearance like palagonite, analysis however showed it to be more nearly related to bole. The basaltic tuffs are distinctly bedded and lie in a horizontal position. They consist of fragments of basalt, both compact and porous, Bunter sandstone, and quartz, accompanied by some crystals of hornblende and augite, the whole being cemented together by a palagonitic material. To judge from the few sections seen the basalt rests immediately on tertiary limestone, and is succeeded by the basaltic tuff and slaggy breccia. (*Fahresbericht d. Oberhessischen Gesellschaft für Natur und Heilkunde*, 14, 30.)

**The Structure of Obsidian.**—In a letter which appears in the *Jahrbuch für Mineralogie*, 1873, part iv., 394, A. Kennigott describes the characters of some obsidians from Iceland. Thin sections exhibit numerous spherical cavities, and occasionally very small brownish-black opaque spherules, which are surrounded by a number of small acicular brownish-black crystals about equal in length to half the diameter of the spherules, from which they appear to radiate. In one section the spherules are arranged in a straight line without the usual acicular crystals, and each exhibits an opaque black nucleus surrounded by a brown transparent and relatively thick crust. Near the spherules in the same section are some peculiar groups of acicular black crystals, which for their whole length and on both sides are covered with short black needles lying parallel to each other, and making with the parent crystal an angle of about 60°. There are moreover a few oval or occasionally cylindrical structures which are likewise surrounded by numerous long colourless needle-like crystals. Similar needles occur in isolated groups without any nucleus and crossing each other at every possible angle. These groups constitute the bulk of the minute white specks distributed through the obsidian; those seen by the naked eye have an irregular outline and are clear and pale-blue under crossed Nicols like the sanidine plates in the black obsidian from Ararat. Colourless crystals of orthoclase, lengthened in the direction of the vertical axis, are also present.

### Botany.

**Origin of European Tertiary Flora.**—Lesquereux in the third report of the United States Survey of Montana concludes that the European Tertiary flora partly originated from Arctic North America. He gives the following summary of his views:—1st. The Tertiary flora of N. America is by its types intimately related to the Cretaceous flora of the same country. 2nd. All the essential types of our present arborescent flora are already marked in the Cretaceous of our continent, and become more distinct and more numerous in the Tertiary; therefore the origin of our actual flora is like its facies, truly N. American. 3rd. Some types of the North American Tertiary and Cretaceous flora appear in the same formations of Greenland, Spitzbergen, and Iceland; the derivation of these types is therefore apparently from the Arctic regions. 4th. The relation of the North American Tertiary flora with that of the same formation of Europe is marked only for N. American types, but does not exist at all for those which are not represented in the living flora of this continent. Therefore the European Tertiary flora partly originated from N. American types, either directly from our continent or derived from the Arctic regions. 5th. The relation of the Tertiary flora of Greenland and Spitzbergen with ours indicates, at the Tertiary and Cretaceous epochs, land connection of the northern islands with our continent. 6th. The species of plants common to the Cretaceous and Tertiary formation of the Arctic regions and of our continent indicate, in the mean temperature influencing geographical distribution of vegetation, a difference in  $+ equal to about 5^{\circ}$  of latitude for the Tertiary and Cretaceous epochs. 7th. The same kind of observations on the geographical distribution of vegetable species shows at the Tertiary and Cretaceous times a difference of temperature according to latitude, analogous to what is indicated at our time by the characters of the southern and northern vegetation.

**Floral Symmetry of Cruciferae.**—The reduction of the flowers of the Cruciferae to a symmetrical type has repeatedly engaged the attention of morphologists. Moquin Tandon regarded the four long stamens as representing a pair which had been multiplied by a *dédoublement*. Mr. Bentham, who is the only British botanist who possesses the rare accomplishment of a familiarity with the Russian language, points out in his recent address that Meschaeff (*Bull. Soc. Imp. Nat. Mosc.*) has pushed the explanation of Moquin Tandon to its furthest limits by regarding the four petals as also the result of a *dédoublement* of a single pair, thus reducing the whole flower to a dimerous symmetry, the different whorls decussating with each other.

**Distribution of Pollen and Spores in Air.**—Mr. Blackly, in a book entitled *Experimental Researches on Hay Fever*, has been incidentally led into an investigation of the amount of pollen present in the air. He began with that of a meadow at the average breathing level (four feet nine inches from the ground). Mr. Blackly's results are not without their interest as showing what an active agent the wind must be in effecting cross-fertilization: The observations were commenced in April and continued till the end of July. A slip of glass was exposed horizontally coated with a thin layer of a non-drying liquid. He tabulates the daily results; and the highest number of pollen grains obtained on a surface of a square centimetre in twenty-four hours was 880 on June 28. Sudden diminutions in the quantity of pollen—when these occurred in the ascending scale between May 28 and June 28—were invariably due to a fall of rain, or to this and a fall in the temperature. Mr. Blackly then proceeded to examine the amount of pollen to be found in the higher strata of the atmosphere. This was done by means of a kite which by being attached to other kites sometimes attained an elevation of 1000 feet. The pollen was found to be much more largely present at the

upper levels than at the "breathing level." Taking the average of the quantities where pollen was present at both levels, he found that whilst the average for the ordinary level was 24 only, for each experiment, that for the higher levels was 472.33, or more than nineteen times as much. After making due allowance for the difference in the velocity of the air at various altitudes, there still remains a great preponderance unaccounted for in the amount of pollen in the upper strata. Mr. Blackly remarks that his experiments also afforded abundant proof of the presence of fungoid spores in the air in large quantities. In one experiment which lasted four hours, and in which the number of pollen grains collected at an altitude of 1000 feet was over 1200, the spores of a cryptogam probably *Ustilago segetum* were so numerous that he could not count them. At a rough estimate they could not be less than 30-40,000 to the square inch. A fact like this makes the ubiquity of fungoid organisms a thing easy to comprehend.

That these organized contents of air travel to a considerable distance was proved by a series of experiments made in the outskirts of Manchester, but within the boundary of one of the most densely populated parts, and in no direction within less than one third of a mile of grass land. The quantity of pollen was only about one tenth of that collected in the country.

### Physiology.

The following are brief summaries of the most important papers read in the Department of Anatomy and Physiology at the Bradford Meeting of the British Association. Prof. Ferrier, of King's College, London, gave an account of the results he has obtained by direct stimulation of various parts of the surface of the brain by Faradic electricity. The animals used for experiment (while under the influence of chloroform) were the cat, dog, jackal, monkey, rabbit, &c. The general effect of irritation of the surface was to produce muscular movements, and these could be predicted by Dr. Ferrier with almost complete certainty. The experiments have now been witnessed by judges sufficiently numerous and competent to place their accuracy beyond doubt, though of course they need extension and interpretation in many directions. It also remains to be explained how it was that earlier experimenters obtained negative results from irritation of the cerebral convolutions, and that even Fritsch, though he to some extent anticipated Dr. Ferrier in similar observations on the effect of galvanism, failed to obtain any movements with the interrupted current. The most important results in the inquiry as yet obtained seem to be: 1. That the areas of surface physiologically distinct are remarkably small, sometimes not above the third of an inch in diameter, so that it needs great care to confine the action of the electrodes to a single one. 2. That several regions when stimulated produce no (motor) phenomena: and this is particularly the case with the anterior part of the frontal lobes, which is probably peculiar to man and monkeys. 3. That the movements produced affect several muscles in groups, and that their contractions are so correlated as to cause the performance of definite operations, such as screaming, mewing, or barking, stretching out the hand for prehension, drawing up the lips and opening the mouth for fighting, pricking the ears and turning the head for listening, and so on. 4. That, speaking generally, stimulation of the upper frontal convolutions affects the facial muscles, of the parts behind and below those of the fore limb, further back, the hind limb, while the cerebellum appears to affect the ocular muscles. 5. That the movements are crossed, with one or two exceptions, the explanation of which confirms the rule. 6. That the supposed seats of emotion indicated by these experiments do not at all agree with those empirically laid down in the once popular system of so-called Phrenology.

A second important paper was by Prof. Burdon Sanderson, of the "Brown Institution," in the University of London, who has found that the movements of Venus's fly-trap produce electrical variations corresponding with those long known in muscle which give rise to the condition of electrotonus.

A third communication was from Dr. McKendrick and Mr. Dewar of Edinburgh, who have succeeded in shewing that the stimulus of light on the retina produces electric variation in the optic nerve. This result, which has been long suspected and was rendered more than probable by Du Bois Reymond, has now been placed on a surer basis, and the objections which might naturally arise from interference of muscular currents, from the action of heat, etc., appear to have been all satisfactorily met. But perhaps the most interesting part of the inquiry is that the results are in complete correspondence with those which would follow from the application of Fechner's celebrated law, deduced as is well known by mathematical processes and now confirmed by the results of direct experiment.

Joseph Barclay Pentland, who died in July last at the age of seventy-five, laboured hard in the field of scientific discovery, as a geologist and geographer. Sent, in 1827, as secretary to the Consul of Peru, and afterwards appointed Consul-general to Bolivia, he availed himself of the opportunities his position afforded him of surveying these elevated regions. He measured the peaks of the Peruvian Cordillera of the

Andes, and was the first to ascertain that Chimborazo was not the highest summit of the Western hemisphere, but must yield in elevation to Sorata and Illimani, mountains of the eastern Cordillera of Peru. Mr. Pentland also took an elaborate survey of the great lake of Titicaca, whose borders were the ancient seat of Peruvian civilisation; his map was published by the Admiralty, but he never could be induced to write the history of his travels.

The intimate friend of Cuvier, Humboldt, Arago, and Elie de Beaumont, Mr. Pentland passed much of his life in Paris. His winters he spent in Rome and he edited the Handbooks of Italy and Rome, for his friend Mr. Murray, the publisher.

### Philology.

**Modern Greek Miscellany.** [Νεοελληνικά Ἀνάλεκτα, περιοδικὸς ἐκδιδόμενα ὑπὸ τοῦ Φιλολογικοῦ Συλλόγου "Παρνασσού." Τόμος Α'. Ἐν Ἀθήναις 1870-72.]

THE Philological Society Παρνασσός at Athens has established a claim to the gratitude of all students of modern Greek literature by the publication of their excellent Νεοελληνικά Ἀνάλεκτα, the first volume of which is now ready before us. It contains the most authentic and unalloyed records and documents of the national life of the Greek nation in its present phase: we receive here Greek fairy-tales in the original text (which adds not a little to their charm), a new collection of popular songs and amorous distichs, a very original one of enigmas and riddles, a series of treatises on points of Greek superstition and usages, and lastly a glossary of the Lesbian dialect annotated by Dr. M. Deffner, a young

German scholar who seems to have fixed his abode at Athens after having completed his studies at Leipzig under G. Curtius and Ritschl. The ἐπιλογος added to his notes on the glossary is highly instructive (though consisting for the most part of a mere application of sound philological method to the study of modern Greek, which, as Dr. Deffner justly observes, has hitherto been more studied by amateurs than by trained scholars), and in many parts continues and supplies the same writer's *Neograeca*, a treatise published in the fourth volume of G. Curtius' *Studien*. It would have been more convenient if Dr. Deffner had referred to the paging of his *Neograeca* in Curtius' collection instead of quoting a separate paging of his own; we have found it very troublesome always to verify his citations. The general tendency of the whole volume is to trace the Greece of old in the modern country, but to do so in a manner at once upright and convincing by producing the people such as they are, in habits, usages, and speech. We agree, however, with Dr. Deffner that the popular speech of the modern Greeks is the strongest evidence in favour of their descent, and that it will be difficult to uphold much longer the well-nigh antiquated theory of a complete extirpation of the Hellenic race, in the face of such linguistic facts as are being gradually collected by the industry of scholars. We would draw attention to the observations of Dr. Deffner in which he endeavours to show that the unalloyed speech of the people—that speech which the blind Atticists of our day despise and the λόγιοι attempt to supersede by a cold and artificial dialect—contains formations evidently older than the Attic dialect itself. In reading such evidence we were reminded of the words of the late Prof. Mavrophrydes in his excellent History of the Greek Language, p. 23: Ἰκανὰ ἔπαθεν ἡ γλῶσσα ἐκ τοῦ ἄκρου ζήλου τῶν ἐπὶ οὐτωκαίεκα αἰῶνας ἀπτικιστῶν ὅς μὴ τὴν ἀσχημίσουν περισσώτερον νεοὶ σπαραγμοί. The present Greek language is not, in fact, the daughter, but rather the younger sister of ancient Greek, and why should it lose all its characteristic peculiarities, those very features which declare it to be the νεωτάτη φάσις τοῦ ἑλληνισμοῦ (Mavrophr. p. 30), and submit again to the lifeless and extinct forms of Attic grammar? But to return to the work before us: little as the compilers of this volume aim at any dogmatism, we think that a single fairy-tale in its naïve freshness is more attractive than an elaborate and polished composition in the literary dialect, and are grateful to the Society for making these documents of national speech accessible to us. A feature frequently met with in these tales is the fondness for riddles and clever sayings, which appears also so conspicuously in the later period of the ancient Greek literature, e.g. in the history of Apollonius of Tyre. We are aware that much material may be added to the notes of the editors on these tales, and many evident analogies of these Greek tales with those of other nations have been overlooked by them. A fox eating grapes is known to us from the well-known Aesopean fable, but it is surprising to find this phenomenon of natural history as the representative of our old friend Puss in Boots, as we do in the tale entitled ὁ ἀφέντης ὁ Τριορρωγῆς (p. 14-16), "The gentleman of the three grapes." The termination of this tale is remarkable for its ingenuity. The last word of it was at first unintelligible to us: τὸν ἀποτοσύφχιασε, but we subsequently found it explained in a note on another tale, p. 33, as ἐλέγχω δημοσίᾳ τιὰ πράξαντα κακόν τι, yet the derivation appears to be obscure: at least we cannot believe that this expression comes from ἀποκύντω. The word ἀκαμάτης which is explained in the Lesbian glossary, p. 387, occurs in the same tale, p. 14, and perhaps it would have been useful to refer to this, inasmuch as it shows that the word is not confined to the dialect of Lesbos. Altogether it would be easy to collect linguistic peculiarities from these tales and poems. We find

τὸ βίος "res familiaris," p. 16, for the neuter use of which we may compare τὸ πλοῦτος in the language of the New Testament and in modern Greek, and the ancient Greek ὁ and τὸ σκότος. We read ἀξάγκωνα p. 121, and ἀξυπόλυτος p. 27, 152, 189, both being evidence of the preposition ἀξ, of which we hope to speak at a future time in the *Academy*. The form ἀχ occurs in a popular song, p. 70: *μὴν ἀχ τὰ χιόνια τὰ πολλὰ, μὴνα κι ἀπ' τὸ χαλάζι* where we may easily suspect that ἀπ' ought also to be ἀχ. The adj. θώρατος is explained πελῳριος p. 17: but as it stands no doubt instead of θεώρατος (cf. p. 47, 53), we should rather think that it means "visendus" = ἀξιόθεος in Alciphron. The form μηνᾶ which is so frequent in mediæval compositions (= μηνύει), occurs p. 133, 253. In his note on the Lesbian meaning of ἔργον (= βαμβακερὸν νῆμα), Dr. Deffner ought to have mentioned the modern ὑργαλίδος "spinning wheel." We agree with the same scholar in rejecting the explanation of the mysterious initial ν in νοικοκυρά, νύπνος, νῶμος as a digamma (p. 412, cf. 457), but we cannot suggest another explanation. For the word νινί "baby" (p. 413) we would compare the well-known English *ninny*, the Italian *ninno*, and believe that there was a Greek word νενός = μωρός. It is common to use τὸ μωρό μου in the sense of "my little one." We are also glad to see that Dr. Deffner rejects Koraës' derivation of ῥίχνω "I throw" from ῥήγνυμι (K. of course also proposes to write ῥήχνω): in a paper printed in the *Trans. of the Phil. Soc. in London*, 1867, the present writer had endeavoured to establish ῥίχνω and ῥίπτω as parallel forms of the same root. But ῥήχός, 458, is direct from ῥηγ— and therefore a later derivation than βραχός, which clearly comes from the earlier form of the root, *Frax*. Dr. Deffner says: ἡ ἀλλαγή τοῦ α εἰς η δὲν εἶναι σπάνιον τι εἰς τὴν ἰων ἐπιδ., but he does not prove α = η. We would finally draw attention to the peculiar and rare use of τοῖς as an acc. (corresponding to ταῖς as acc. in the first decl.) in a proverb p. 181:

οἱ πολλοὶ δὲν εἰν' καλοὶ,  
μόν' σὺν τοῖς ἐχθρῇς 'ς τὸ φατ.

At present I can quote only one other instance of this form from a popular song edited by Legrand in No. 12 of his Collection (see his Preface p. 5 sq.). We will end with the question whether *μπγάς* (411) = ὁ ὀργῶν καὶ νεώτατος ταῦρος may be traced to *μπαίνω* in the sense of *ἐπιβαίνω*.

We refrain from producing more details, but once more recommend this interesting volume to all students of modern Greek. If we may venture to offer some advice to the Society, we would counsel them in future to employ greater care in revising their proofs—only the last number (edited by Deffner) is tolerably free from errors of the press.

W. WAGNER.

**The Complaynt of Scotland**, A.D. 1549; with an Appendix of four contemporary English Tracts; re-edited from the originals with Introduction and Glossary by J. A. H. Murray. (Early English Text Society.) Trübner and Co.

PERHAPS the reader of Scott's *Lord of the Isles* may recall to memory the lines—

"Quenched is his lamp of varied lore,  
That loved the light of song to pour:—  
A distant and a deadly shore  
Has Leyden's cold remains."

Such is the fitting epitaph upon the poetically-minded and studious author of *Macphail of Colonsay*, and the *Mermaid of Corrievrekin*, whose early death at Java was so sincerely lamented. Amongst other things, we are indebted to Dr. John Leyden for the edition of the *Complaynt of Scotland* published in 1801, copies of which are very scarce, as only 150 were printed. To Mr. Murray we are now indebted for a reprint of this, corrected in a few necessary

instances by help of the originals in the British Museum. We cannot help congratulating the reader upon the fortunate circumstance that the duty of reprinting and re-editing has fallen into such excellent hands; for Mr. Murray's careful introduction and glossary leave nothing to be desired. He has done well to incorporate the remarks of Dr. Leyden in his own account, wherever those remarks seemed in any way worth preserving.

It is not very clear who was the author of this curious book. It has been attributed to Sir James Inglis, Sir David Lyndesay, and to one Wedderburn. Respecting the first name, Mr. David Laing has discovered two owners of it. One of these was abbot of Culross, and was murdered in 1531, eighteen years before the *Complaynt* appeared; so that the author clearly was not he. But there was another Sir James Inglis who, from about 1508 to 1550, was chaplain of the Abbey of Cambuskyneth, and, though he must have been upwards of sixty years old in 1549, his claim is more difficult to disprove. The internal evidence shows conclusively that it is not Sir David Lyndesay's. But in the Harleian Catalogue the book is twice set down as "Wedderburne's Complaynte of Scotland," and, though there is nothing to show what authority there was for the assertion, we agree with Mr. Murray that it is very likely to be correct, as the name Wedderburn is of frequent occurrence, and there seems to be no reason why it should have been mentioned in so explicit a manner unless the compiler of the Catalogue had some good reason for it; in the shape, probably, of a note now lost. However, we quote Mr. Murray's opinion on the subject. "The only things," he says, "I consider certain as to the author are (1) that he was a distinct and thorough partisan of the French side; (2) that he was a churchman, still attached to the Catholic faith; (3) that he was a native of the Southern, not improbably of the Border, counties. Sir David Lyndesay is peremptorily excluded from consideration; no less so, I think, is Wedderburn, vicar of Dundee; in lack of further evidence, the claims of Sir James Inglis of Cumbuskenneth, and of some unknown priest of the name of Wedderburn, are equally balanced, though, if the part of Mackenzie's Life which calls Inglis a Fife man belongs to this Inglis, the evidence of dialect would be against him." Like Mr. Murray, we incline to the "Wedderburn" theory; chiefly, perhaps, because there is nothing against it, and one small piece of positive evidence in its favour.

In discussing the language of the work, Mr. Murray, himself the author of a book on the Dialect of the Southern Counties of Scotland, is particularly at home and trustworthy. It is a great comfort to find him leaving alone all petty squabbling about a Scottish as distinct from an English language, and boldly stating the broad fact that, before the year 1450 at any rate, the language of Lowland Scotland was originally identical with that of England north of the Humber. Until this fact be clearly perceived and thoroughly accepted, we shall never gain any clear ideas on the subject. Whether we give to the old language of the whole district between the Forth and Humber the name of old Lowland-Scotch or of old Northumbrian is a matter of very secondary importance, and a mere question of convenience, so long as it is seen to be all one. We are not discussing a question of nationality, but of philology; and it is only because old Northumbrian is the more convenient term that we incline to the use of it. And it is more convenient, because we are already familiarised with the notion of including Lothian in Northumbria, but not with the notion of including Yorkshire in Scotland. One thing has considerably tended to darken the matter; and that is, the very changeable way in which the word *Scottish* has been applied;

the meaning of the word at one date is not the same as its meaning at another. In fact, in this point as in all others where philology is concerned, chronology has to be much considered. If, indeed, there be a study which, in English philology at least, has been completely ignored, it is that to which we would give the name of the *Chronology of Etymology*. We trust our readers will make a note of this; for we make bold to say that if, henceforth, the *Chronology of Etymology* could be once admitted as a *leading and necessary* principle of English etymology, one half of the false derivations would speedily go by the board. It has been dimly recognised by most of our best students; but, by those who have only a limited knowledge of etymology, and who are, on that account, constantly suggesting new derivations which they cannot *themselves* perceive to be absurd, it has always been, and will continue to be, persistently ignored. It is not enough to suggest that such a word or phrase might be derived from such another word or phrase; it is also required that the word said to be the original is truly the older form, and that the change in spelling is such as, in accordance with the known history of the language, may reasonably have taken place. An example will perhaps place this in a clearer light. There is a provincial word *chare*, which in Newcastle means a narrow street or by-way; it is identical with the Wiltshire *chore*, which means a narrow passage between two houses, and with the Midland form *chure*, meaning a passage, by-way, or turning out of a larger road. Now there is nothing absurd in deriving this from the A.S. *cerre*, flexus, viæ deflexio, diverticulum, anfractus, as Lye explains it, because we know that the verb *ceran*, to turn, with the variable spelling *cyrran*, was used in England before *chare* was; and that the change of *c* into *ch* satisfies the *Chronology of Etymology*. We have a like instance in what is, possibly, the same word in another sense, viz. the word *chare*, a turn of work, certainly derived from A.S. *ceran*, and preserved in *char-woman*. But our point is, not that we assert this derivation to be the right one, for it is still a little uncertain, but that it is a possible one; since it satisfies—if we may be excused for repeating the phrase—the *Chronology of Etymology* as well as the *History of the Language*. Yet when, not long ago, the Midland word *chure*, a passage, was proposed for etymological solution in *Notes and Queries*, what happened? Immediately two writers came forward with the positive reply, that it was clearly the German word *thür*, a door! But what wild work is here! How do we know that, chronologically, the German *thür* ever existed in England before *chure*? Indeed, we may ask what proof is there that High German was ever spoken, in olden times, in the Midland Counties? If an Englishman knew what a *door* was, why should he trouble himself to pronounce it *chure*? It is time to put aside such puerilities as these; we must no longer be misled by mere similarity of sound, but we must satisfy all the requirements of chronology and history. Little as we know of the exact history of all the successive changes in our language, surely we know enough to avoid such odd blunders as this. But such is English "etymology" in 1873.

This digression has been suggested by the sound ideas which Mr. Murray holds regarding "Scottish," and merely with the view of more forcibly showing the necessity of attending to dates. The language of the *Complaynt* belongs to the "Middle-Scotch" period, and is classed with that of the works of Bellenden, Gawain Douglas, and Lyndesay. Mr. Murray's statement respecting the apparent locality of it is very interesting. He says: "While I cannot read ten lines of Lyndesay without having it forced upon me, as a native of Roxburghshire, that his form of Scotch is not mine, I have everywhere found the language of the *Com-*

*playnt* familiar as the tones of childhood, and ever and anon have been surprised at the sanction which it gives to forms or idioms which I had thought to be modern vulgarisms of the local patois, but which are thus shown to have a pedigree of three and a half centuries to plead." We may therefore put down the work as an example of the Roxburghshire variety of the Middle-Scotch period. Let us beware, also, of too hastily assuming that provincial words, however vulgar, are of modern formation. We must not omit to notice the great number of French words which abound throughout the work, owing to the intimate connection in that age between France and Scotland.

The object of the work was to issue a strong appeal or "exhortation" to the three estates of the realm, the nobility, spirituality, and commons, in order to awaken them to a consideration of the gravity of their position; in the hope that they might be induced to forego their civil bickerings and debates, to cultivate unanimity amongst themselves, and to make common cause against England. The most interesting point is, that something like a more satisfactory state of things seems to have come about nearly at this time; due, no doubt, as Mr. Murray says, to the treaty between England and France made in 1550; one result of which was that the author, feeling somewhat more satisfied in his mind and less anxious to confine himself solely to matters political, went so far as to add to his work a very curious chapter (in fact the one by which it is best known) which he entitles "Ane Monolog of the Actor," or, as it may be called, "A Monologue Recreative of the Author;" see pp. 37-68. This is certainly a very singular production. He describes how, being weary, he walked abroad in the fields till sunset on a certain 6th of June, continued walking about all night, and then beheld the daybreak. Then comes his famous description of dawn, how beasts and birds of every sort began to make peculiar noises, each after its kind. "The bullis began to bullir, quhen the sheep began to blait, be cause the calfs began till mo, quhen the doggis berkit." And so it goes on at some length, telling us the right names for all the various animal sounds. Thus we find that the ass roared, the hens cackled, the cocks crew, the chickens "pewed," the glade (kite) whistled, the geese cried "clack," the goslings "quhilk," and ducks "quack." The cranes "crooped," the crows said "warrok! warrok!" the swans mourned, the turtles greeted, the cushat yowled, the dove "crooded her sad song that sounded like sorrow" (no bad alliteration), the swallow jargled, and the jay jangled. The lapwings cried "thieves neck!" whilst the pies clattered. The sparrow cheeped, the ousel yelped, the goldfinch chanted, the red-shank cried "my foot! my foot!" and the ox-eye tomtit cried "twit!" The herons gave a wild screech as if the kiln had been on fire. Then the author went down to the sea-shore, where, gazing across the flood, he saw a galliasse appointed for war. He then describes at length the weighing of the anchor and the unfurling of the sails, specifying all the cries used by the mariners during the operations. Then the guns are got ready for action; the order given being—"Gunners, come here and stand by your artillery, every gunner to his own quarter. Make ready your cannons, your culverin 'moyens,' culverin bastards, falcons, sakers, half-sakers, half-falcons, slangs and half-slangs and quarter-slangs, head-sticks, murderers, passevolans, berches, dogs, double berches, hackbuts 'of croche,' half-hacks, culverins, and hail shot. And ye, soldiers and companions of war, make ready your cross-bows, hand-bows, fire-spears, hail-shot, lances, pikes, halbards, rondels, two-handed swords and targes." Then follow the noises made by the various pieces of artillery. Then the author returns to the fields, sees some shepherds, and describes all that

they had for breakfast. He next lectures them on the excellence of a pastoral life, quoting all manner of examples, from King David to Amphion, and from Abraham to Paris, son of Priam. Next he gives a small treatise on astronomy, explaining the primum mobile, the meridian, the colures, &c., carefully proving the existence of antipodes. He goes on with the planets, the comets, and meteorology. After this, he cites the names of all kinds of tales and romances, the Canterbury Tales, the Wallace, the Bruce, Arthur, Bevis, Pyramus and Thisbe, and many more; next, of numerous songs, as "King William's Note" and the "Hunts of Cheviot;" next, of dances, as "the hunt's up," the lamb's-wind, the shake-leg, the shake-a-trot; next, of flowers, as "barba aaron," water-lily, hemp, celandine, &c., &c.; after which he expresses himself as "beand contentit of that pleysand nychtis recreatione," as well he might be. It will of course be understood that we have modernised the spelling considerably; it is singular that the present work is far harder to read than the older Northumbrian of Barbour.

The Appendix contains (1) the Just Declaration of Henry VIII., A.D. 1542; (2) the Exhortation of James Harrysone, Scottishman, 1547; (3) the Epistle of the Lord Protector Somerset, 1548; and (4) the Epitome of Nicholas Bodrugan, alias Adams, 1548. These all help to illustrate the main part of the work. The Glossarial Index "aims at registering all the words which differ in spelling or usage from modern English;" and occupies forty pages. Such indices are very valuable; it is only by compiling a considerable number of them, to be afterwards combined, that we can lay the foundation of a good General English Dictionary.

WALTER W. SKEAT.

#### PROFESSORIAL DISSERTATIONS OF UNIVERSITY COLLEGE, LONDON.

IN *Professorial Dissertations for 1872-3* (University College, London) Mr. Henry Malden has given us a thoughtful, and indeed exhaustive discussion on a long-disputed question, the number of the chorus in the *Eumenides* of Aeschylus. His conclusion is a very reasonable one, that in the prologue, in which the Furies appear upon the stage in the shrine of the Pythian temple, they are there rather as actors than as a chorus, and only three in number. The limitation of the Furies to three was probably, as he says, somewhat later than the mythology with which Aeschylus was familiar: but he also rightly observes that "three was a favourite number in the definite forms of mythology" ("in later times," he need not have added; the Gorgons as well as the Phorciads were three, *Prom. Vinc.* 795-8). It is very probable, and it removes several scenic difficulties to assume, that three principal Furies first appear in the action, and are reinforced, as it were, by twelve more, when they unite in a general chorus. Mr. Malden ingeniously cites *Choeph.* 1057 (Dind.),

ὄναξ Ἀπολλων, αἶδε πληθύνουσι δὴ,

where he considers the version I had given of πληθύνουσι, "they swarm," less correct than "they get more in number." He supposes that Orestes sees only three at first, and then the larger number appear—crop up, as it were—one after the other. In support of his view he might have cited *Eum.* 589,

ἐν μὲν τόδ' ἦδη τῶν τριῶν παλαισμάτων,

the point of which would be (besides the well-known allusion to the "three throws" in wrestling), that one of the three accusing goddesses has already gained her victory decisively.

A good service would be rendered to the history of ancient thought by any one who would investigate the causes why the mystic *Three* has exercised such extraordinary influence in all the mythologies and religions of the world from Homer downwards, where the Triad of Gods is distinctly enunciated (*Il.* xv. 187). Even the triple-leaved shamrock survives to this day, as the fleur-de-lis so long prevailed in heraldry, as an emblem of the mystic number.

In the trial scene, Mr. Malden thinks it not unlikely that the three chief Furies ascended to the stage to appear as accusers before the Areopagus, leaving a chorus of twelve on the orchestra. He is probably right. This ascent (*ἀναβαίνειν*) from the orchestra to the stage by stairs was certainly adopted in Comedy (e.g. *Ar. Ach.* 732; *Equit.* 149; *Pax* 427, and perhaps *Vesp.* 1342); and there is no reason why the licence should have been withheld from Tragedy.

Mr. Malden, in giving his opinion that the eccyclema was used for exhibiting the interior of the temple of Delphi to the spectators, has

omitted to notice that this is expressly stated by the scholiast (quoted on v. 64 of my edition), and also that the same scholiast on 585 (Dind.) gives the number of the chorus as 15 (*ἑ γὰρ ἦσαν*).

With regard to the size of the stage in the great theatre at Athens, Mr. Malden thinks, with A. W. Schlegel, that it was small, and could hardly hold eighteen persons. Yet it seems certain that in the *Agamemnon* the King enters the stage on a mule-car with Cassandra by his side, and doubtless a body of attendants. In the *Acharnians* (156) a sufficient number of persons appear to be called ὁδοματῶν στρατός, — and that they do really appear, and even show fight to some purpose with Dicaeopolis, is clear from the context.

Nor is it at all certain that either in the *Choephores* or the *Persians* the tomb (tumulus) of Agamemnon or Darius was represented by the *θυμέλη* in the orchestra. To make the prologue spoken by the *πρωταγωνιστῆς* in the orchestra is, I conceive, a view neither necessary nor consistent with tragic usage; and I think that both in the *Choephores* and the *Electra* of Sophocles the tomb was actually on the stage. This is confirmed by the scene in the *Pax* of Aristophanes, which (if I have rightly explained it in my preface to that play, p. xii.) requires a heap of stones, under which the goddess is supposed to be buried, to be on the stage itself, and also a number of workmen who are engaged with ropes and mattocks in removing them to another part of the stage (v. 361, *ποὶ τοὺς λίθους ἀφέλωμεν*). If so, it is impossible that the stage could have been very small, though the *λογεῖον*, or front part of it for the actors when speaking, may have been so.

I doubt whether Mr. Malden has seen the very interesting and beautiful vase-painting that forms the frontispiece to my third edition of Aeschylus. There *two* furies only are represented in the temple of Delphi, there being, in fact, no room in the group for a third. But the evidence of this drawing, as far as it goes, is decidedly in Mr. Malden's favour.

Mr. R. Ellis has a dissertation, replete with learning and wide research, on some difficult passages of that most obscure of Roman poets, Propertius. In iii. 18, 35 (ii. 26, 35 as he gives it, after the old editors), the MS. reading *cum ratis Argo* is defended against the emendation (such it probably is in ed. Ven. 1488) *cum rudis Argus Dux erat*, &c. Mr. Ellis takes *Argo* as the dative of *Argus*, the builder of the ship, and translates, "When the dove, launched on a strange sea, served Argus as the guide of his ship." And there seems no valid objection that can be raised against this view. He thinks the mistake arose from the wrong notion that *Argo* meant the ship itself, and therefore required some change in the case.

The legends of the Argonauts were, as he says, very various, and poets by no means agree as to localities. In its origin, I cannot doubt that it represented the voyage of some early adventurers in search of the sun-lands, if not of the sun itself, in the far east. This representation of the sun by a golden fleece or a phosphoric garment is well known in mythology; and Medea as the granddaughter of Helios fully confirms the view. In a voyage altogether mythical it is vain to identify localities—a remark that applies equally to the wanderings of Io in the *Prometheus* and of Ulysses in the *Odyssey*. It does not therefore, as Mr. Ellis says, "surprise us if we find Propertius using a wholly different account of the passage of the Symplegades from that of Apollonius."

A much more difficult passage is in iv. (iii. Barth.) 7, 21 seqq., where the "Argynni poena" is rendered very obscure by the corruption of the end of the verse into "minantis aquae." The reading adopted by most editors, "Athamantiadae," though at first sight a plausible conjecture, seemed to me so unrhymical that I preferred in my edition to retain the vulgate marked with an *obelus*. Mr. Ellis now suggests

Quae notat Argynni poena, Mimantis aquae,

and also, but with less confidence,

Qua notat Argynni poena Mimantis aquas.

But his translation is certainly somewhat forced, "shores signalized by the punishment of Argynnus, the waters of Mimas that drowned him." *Mimantis aquae*, he says, is a nominative in apposition with *poena*. As for the locality, he admits that in the ordinary mythology it was placed in Boeotia, on the banks of the Cephissus. But, as the poet mentions the Carpathian sea as the scene of the wreck by which Paetus was drowned, he supposes him to have transferred it to the coast of Asia Minor, and he rather ingeniously suggests that the islands Argennusae may record the story of Argynnus as a local legend. (More probably, I should say, the word is a corruption of *ἀργυροῦσαι*, "white islands.") Here however is the stormy headland Mimas; and Mr. Ellis cites *Thuc.* viii. 34 in proof of its known danger.

It may be doubted if Propertius is rightly called "a learned man" (p. 24). He was so only in the sense that he was a pedant in Greek learning. His ignorance of geography is very often shown; and like Virgil's knowledge of farming, he got what he knew only from books, and often mixed up different accounts in one and the same story.

The last passage discussed by Mr. Ellis is v. 51, 21.

Si te Eoa Dorozantum juvat aurea ripa,  
where he rejects the easy and probable correction *Doryxeniūm*, as the familiar name (*ὑποκρίσμα*) of a mistress, and supposes Propertius to

have used a semi-barbarous Latin form to express Dorakta or 'Oδρακτα, off the coast of Carmania (Persian Gulf), and that *aurea ripa* is an attempt to express the same word. This may or may not have been the case. For my own part, I think he had heard of an *Aurea Chersonesus* in the far east, and knew neither where nor what it was. This is one of those many passages in which we cannot hope ever to get beyond vague conjecture.

These Professorial Essays are indications of real work and much energy in the cause of learning. Like the *Cambridge Journal of Philology*, the occasional publication of them affords at once scope and encouragement for scholars to put their thoughts on paper. We are beginning, we may hope, if late, yet not wholly without effect, to follow the example so long set us by the Germans.

F. A. PALEY.

### Intelligence.

Mr. George Smith has just discovered the fragments of an Ancient Assyrian Canon, from the Babylonian copy of which the much-contested Canon of Berossus was unquestionably derived. The importance of this relic to Chronologists can scarcely be over-estimated, and it will form the substance of a paper shortly to be read before the Society of Biblical Archaeology by its fortunate discoverer.

The Congress of German Philologists, which was to have taken place at the end of September in Innsbruck, has been postponed till next year on account of the cholera.

Dr. Beke's projected expedition for the verification of the true Mount Sinai, says the *Athenæum*, is now assuming a practical form. Several gentlemen have kindly promised contributions, provided the whole amount required, estimated at £500, be forthcoming. It will be remembered that Dr. Beke is of opinion that "the Mount of God in Horeb" is not anywhere within the peninsula between the Gulfs of Suez and Akaba, but in the Arabian desert east of the head of the latter gulf. His views are more fully developed in a recently published pamphlet, *Mount Sinai a Volcano*.

We have received part i. of Mr. Dunbar Heath's new work *Phœnician Inscriptions* (Quaritch). It is difficult to treat such an eccentric publication seriously. Mr. Heath has a strong antipathy to the square Hebrew character, and the practice of writing it from right to left, which constitutes, in his opinion, "an immense bar to the popularisation of Semitic research." As if, forsooth, "Semitic research" needed to be "popularised." He has also several new, or partly-new, theories to ventilate touching the origin of Christian ideas, which we need not inflict upon the reader, as they are based for the most part on a philology of the wildest description. For a specimen of the latter, take the "obvious," "or at least probable" derivation of "Ashtor or Gash-teret from a common root with *yaorh*, uterus, *ἰστέρα*, &c." The inscriptions (among which the Moabitish of Mesha is included) are well known with the exception of four "devotee inscriptions" derived from the so-called "Moabite pottery," the genuineness of which is, to say the least, extremely problematical. They are all printed on Mr. Heath's new plan—from left to right.

**Society of Heb. Literature.**—The first publication issued under the auspices of this Society is entitled a *Miscellany of Hebrew Literature*, and contains, a specimen of the Biur on Genesis (*Bemisch*); specimen of the book Cusari (*Neubauer*); Zunz on the sufferings of the Jews in the Middle Ages (*A. Löwy*); Letter of Maimonides to Rabbi Jehudah Ibn Tibbon (*Idler*); Chisdai the son of Isaac, translated from the German by A. I. K. D. under the direction of Dr. S. Davidson; &c., &c. The subject-matter of the extracts is interesting as far as it goes, but there is a fragmentariness about the publication which is only justifiable in an introductory specimen-volume like the present. It is to be hoped that in future the Society will give their attention to complete works, such as their *Commentary on Isaiah*, which will be reviewed shortly in the *Academy*. It may be remarked in passing that the *Miscellany* shews occasional signs of haste: *Chamdu lillahi* is written (p. 7) without *el*; there are some slight misprints in the Arabic of pp. 64-7; for "single chapter" (p. 70) read *verse*; the rendering at the commencement of p. 53 is inaccurate and contradictory; on p. 57 we read, that "the giving of the names rested upon the distinction between the species, which differ from each other like seals (each bearing a different engraving), as explained before," where we should read simply that the giving of names is a "separation of species and distinction of their powers." Is it implied (p. 26) that the saying: "From Moses to Moses, &c." refers primarily to Mendelssohn?

But, not to enlarge upon details, we may say generally that the work will prove a useful addition to the student's library, and is well suited as an introduction to the more solid works which, it is to be hoped, will speedily follow.

### Contents of the Journals.

*Zeitsch. d. deutschen morgenl. Gesellschaft*, vol. xxvii. Nos. 1 and 2.—On the Paddhati of Cārgadhara; by T. Aufrecht.—Excursions into the region of the history of chess; by K. Himly.—Seventh

Athenian Phœnician inscription; by J. Gildemeister.—On forgeries of inscriptions; by A. Socin; with postscript by K. Schlottmann.—The shrine-bearing statue of Harual; by G. Ebers.—Explanation of Vendidad i.; by E. Sachau.—Massorah among the Syrians; Some recent discoveries in Syriac literature; and The grammatical book *Sekel Tobh*; by A. Geiger.—From letters of Dr. Socin and Dr. Goldgiher to Prof. Fleischer.—Further notes on the dual in Hebrew; by G. M. Redsløb.—Reviews of Strack's *Prolegomena critica* (Dillmann); Abbeloos' and Lamy's *Barhebraei Chronicon* (Zingerle); *The Pandit* (Weber); Wright's *Catalogue of Syriac MSS.*, part iii (Nöldeke); Abu'l-Walid's *Book of Hebrew roots*, fasc. 1 (Geiger); al-Maqqari's *Book of the shining torch* (Mehren); Baer's *Liber Jesaiæ* (Mühlau); Tiesenhansen's *Coins of the Oriental Chalifate* (Blau); Haug's and West's *Book of Arda Viraz* (Hübschmann).

Voltaire et la Société Française au XVIII<sup>e</sup> Siècle. 5<sup>me</sup> Série. Voltaire aux Délices. Par Gustave Desnoiresterres. Paris : Didier. 1873.

M. DESNOIRESTERRES' last volume, like all its predecessors, contains the fruits of so much research so pleasantly arranged that it is scarcely reasonable to complain of the dimensions which the work is assuming. It may be said that no one can pretend to understand Voltaire who has not the patience to follow the story of his life, crowded as it is with an inconceivable number of trivial incidents, passing relationships, and the incessantly varying results of his restless activity, and that therefore in a work of any detail abridgment would amount to misrepresentation by making its subject appear less versatile and *remuant* than the fact. But though the matter of the work would not easily admit of compression, the author's style is rather too leisurely for a biography promising to fill seven or eight large volumes; we do not ask to be spared the narrative of one of Voltaire's domestic explosions, literary combats, mystifications, intrigues, reconciliations, or the like; or a single description, by friend or foe, of his person, his character, his hospitality, his fashion of life at Cirey, at the *Délices*, or at Ferney: but when the author comments intelligently and appropriately on each fresh incident as if it were the first of its kind, his involuntary repetitions tend to become tedious from no worse fault than their number.

This volume begins in 1753, when, after his rupture with Frederick, the poet was seriously at a loss to know in what territory he would be allowed to pitch his tent in peace. France was practically closed against him, for "la permission de voyager," which he spoke of with ironical gratitude as having been accorded him by the king his master, was certainly one of those permissions which are meant and understood as commands; Stanislaus was given to understand that his presence in Lorraine would be unfavourably regarded, and his first attempts at making a final settlement in Switzerland were baffled by laws against the possession of land in the pays de Vaud by a papist, *un papiste comme Voltaire*, adds M. Desnoiresterres. This difficulty being happily overcome, the poet was able to indulge his favourite amusements, building, planting, beautifying, and, before long, directing a private theatre, at which point his puri-

tanical hosts felt bound, in the interests of the morality of Geneva, to interfere with his proceedings. The controversy between Rousseau and D'Alembert on the influence of the drama, which grew out of this dispute, and was interwoven with that between Rousseau and Voltaire himself on the subject of his poem on the earthquake of Lisbon (Nov., 1755), is the most noteworthy episode in the present volume. In *Le Désastre de Lisbonne* the subject makes the poem, and the poet was for once too much in earnest to be rhetorical; the spectacle of Voltaire really in doubt—not confidently demolishing his neighbour's faith, but, for once, sincerely bewildered, without a remedy to suggest, and reduced to give helpless, and therefore hopeless, expression to simple grief and compassion—was naturally less striking to contemporaries, many of whom shared more or less in his feelings of the moment, than it is now, as the one disinterestedly impassioned utterance of the humane rationalism of the century;—disinterested because Voltaire's eloquence could not rebuild Lisbon nor ward off similar catastrophes in the future, whereas his zeal against persecution or oppression in church or state was always *ad hominem*; if he did well to be angry, it was because some benevolent purpose might be served by his wrath. There were no real pessimists in the eighteenth century (except perhaps Swift); there seldom are in an age pre-occupied with the points in which it differs for the better from its predecessors; and the difference between Voltaire and Rousseau about the best possible world did not therefore go much below the surface; they were agreed that this *ought* to be the best of worlds, and the only question was whether there was a sense in which it might be called so already, and if not, who was to blame for its imperfections. Rousseau argued that if there were no towns, they couldn't be swallowed up by earthquakes; Voltaire, that if there were no earthquakes, people might build towns without risk of being swallowed up; and the conclusions of both were more irrefragable than practical or consoling; at any rate we have no reason to doubt the sincerity of Voltaire's reluctant concession to something not unlike orthodoxy in the present poem; he objects to Leibnitz and Pope :—

"Quand la mort met le comble aux maux que j'ai soufferts,  
Le beau soulagement d'être mangé des vers !"

but the possibility of consolation is a fixed postulate with

all, and the very strength of his conviction that this is not the best of all possible worlds inclines him to believe in a *Deus ex machina* bound by profession to make it so.

It was about three years after the exchange of polite but rather cool letters on this subject that D'Alembert's article on Geneva in the *Encyclopædia*—which contained a protest against the illiberalism of not allowing Voltaire to amuse himself and educate the Genevise by having his own plays acted in public—elicited amongst other protests, Rousseau's Letter of a Citizen of Geneva against the Stage; which, while marking, as Mr. Morley observes, Rousseau's definite schism from the philosophic congregation, was most especially and conspicuously an attack upon Voltaire. In this case, as in most of those in which we find the two great names of the literary revolution opposed to each other, the difference was partly a matter of principle and partly of character. All the traditional objections to the immorality or the immoral tendency of stage plays which are eloquently rehearsed by the citizen of Geneva apply with equal force, as they often have been applied since, to the realistic novel of sentiment; but it was not exactly an accident that while Voltaire was nearly as much in earnest about the lofty mission of the theatre as Goethe, Rousseau, whose glowing appeals to the social passions were themselves written in solitude, preferred to work upon his readers one by one, instead of collectively on an audience. One method is not of course more moral in itself than the other, but the effect of the romance was apt to be more deep and lasting and therefore the more practical of the two, since it influenced the conduct through the character. The drama, on the other hand, generally flourishes most triumphantly in a period just preceding great practical and intellectual movements. The superabundant vitality, which has not exactly decided upon the material channels into which it will be poured, expends itself upon the creations of objective art, with little or no direct didactic result, though the ready perceptions and versatile sympathies of a theatre-going generation certainly make action easier to their more serious successors. But to account for the extreme seriousness with which Goethe and Voltaire, who had so little else in common, both believed in the mission of the stage, and both positively delighted in superintending dramatic representations of their own or other works, we may suppose that they found in this most creative of the arts a substitute for, and perhaps a foreshadowing of, the really creative or reforming action of the generation following their own. To feel *with* others is an indispensable preliminary to feeling *for* them, as this again to any wide schemes for acting for or with them. But the drama in which great artists find it possible to believe is always of the classical, ideal sort, representing heroic emotions which it is desirable to feel rather than those which are common amongst contemporaries; in France, even during Voltaire's life, we see how, as practical interests became more absorbing and practical reforms more possible, realism takes possession of the stage, beginning with satire as with Beaumarchais and *Les Philosophes*, and ending as the merely trivial amusement which Rousseau denounced—rather prematurely while there were still audiences capable of dissolving in tears over Madame Denis's *Zaire*.

Voltaire certainly needed all the consolation his theatre could give him, for his intervention in public affairs was seldom as successful as it deserved. With his usual inventive generosity, on hearing of the court-martial on Admiral Byng, he wrote to the Maréchal de Richelieu for a letter, which should do all that the testimony of an enemy could in his favour, and forwarded it to the Admiral to use at his trial; it is this magnificent sense of being concerned in

every injustice in Europe which there was the most remote chance of his being able to arrest that makes the dictatorship of opinion which he really exercised seem too little for his powers and deserts. He was less happy in inventing machines of war, and the French army did not lose much by the neglect of his suggestion to send armed Assyrian chariots against the Prussians. M. Desnoiresterres gives a very good account of the unsuccessful negotiations for peace in which Voltaire's mediation was accepted, since his neutral position saved the French court from being compromised, and into which he threw himself with much zeal; we do not easily think of Voltaire as a statesman, but at a time when the Abbé de Bernis was chief minister the state could certainly not lose by employing his services. The draft of a treaty which he drew up has been lost, but some of his diplomatic notes are a charming amalgamation of business, philosophy, and couplets. After quoting some of Frederick's own verses, to put him in a good humour, he writes in one letter, "Votre majesté m'avait dit souvent que les peuples de Westphalie étaient des sots. En vérité, sire, vous êtes bien bon de régner sur ces gens là. Je crois vous proposer un très-bon marché en vous priant de les donner à qui les voudra." It would be impossible to put a disagreeable suggestion more attractively.

In 1760 Voltaire was consoled for the death of Maupertuis, his old enemy and convenient butt, by the infatuation of his successor at the Academy, Le Franc de Pompignan, whose *discours de réception* was a long, vehement, and unprovoked attack upon the philosophers. Le Franc was one of the men who having by accident become more famous than they deserve, can only hope to retain a nominal celebrity by not reminding the public of its original mistake; he had the misfortune instead to take his own greatness seriously; he wished to be tutor to the *Enfants de France*, he provoked Voltaire, and perished miserably under a slow fire of exquisite epigrams, unpitied even by the orthodoxy he had vindicated or by his patron the Dauphin, who was heard to quote from Voltaire's *Sur la Vanité* the last line, which comes after a passage of fine satiric commonplaces on the ephemeral glories of empire,

"César n'a point d'asile où son ombre repose;  
Et l'ami Pompignan pense être quelque chose!"

It is he who is made to say:—

"Pour trouver bons mes vers il faut faire une loi;  
Et de ce même pas je vais parler au roi,"

and of his own *Cantiques sacrés*:—

"Sacrés ils sont, car personne n'y touche."

Besides being massacred in verse, seven pages of Voltaire's most biting prose appeared anonymously under the title *Les Quands*, and was so much the rage that the Abbé Morellet decided the unfortunate victim must be made to *passer par les particules*; fairly laughed out of Paris, under a shower of les Si, les Pourquoi, les Car, les Que, les Pour, &c., he retreated to le Pompignan, where he died in 1784 without having dared to re-appear at the Academy. It is significant that the phrase "to have the courage of one's opinions" should be of French origin; the courage of acting upon the opinions they have has never been rare amongst Parisians, but the courage of *having* opinions, especially opinions that may be laughed at, is so uncommon as to be singled out for proverbial encomium; the desertion of poor Le Franc de Pompignan by the large class that was really of his way of thinking is a melancholy example of its absence. By comparison one is almost compelled to admire Fréron (whose account of the first representation of *L'Ecosaise* ends this volume), for the heroic pertinacity with which he continued to make jokes when the laughers

were all against him, and to protest in the *Année littéraire* that he was still alive and critical (rather like Nicolai in his later years), when according to every rule and precedent he ought to have been annihilated. The attacks on Gresset are less justifiable, but as the leader of a very militant church Voltaire might perhaps be excused for believing that those who were not with him were against him; this feeling, without such actual jealousy as M. Desnoiresterres supposes, would be enough to account for what seems cold and grudging in his recognition of the merits of really great men like Montesquieu and Buffon.

EDITH SIMCOX.

*Le monde slave, voyages et littérature*, par Louis Leger. Paris: Didier. 1873.

M. LEGER's little book is exceedingly clear and well written, its author having assumed, and no doubt rightly, great confusion of thought on the part of the French reading public with regard to his subject. At the same time it is perhaps not hypercritical to observe that the title is a little too ambitious. Only two chapters treat of the Slav world in general—the introduction, containing a sketch of the various members of the Slav family and the attempts hitherto made to popularize the knowledge of them in France, and an essay at the end of the book on *les origines du panslavisme*. This last essay is perhaps the most interesting in the book. It enumerates the various testimonies of a sense of their common origin and kinship which are to be found in the literatures of the different Slav peoples before the beginning of the present century. Of the nine remaining chapters three treat of impressions of travel among the South Slavs and in Bohemia. A sketch of the career of Bishop Strossmayer, the modern "Maecenas" of Croatia, and the literary history of the South Slavs occupy two more. The author uses his personal observations to modify and to some extent correct the pessimism of the Moscow professor, whose report serves as the basis of a chapter on the management of Russian theatres. Critical analyses of an interesting Serb drama by M. Ban, of Count Tolstoi's *Ivan the Terrible*, and of Messrs. Dixon and Barry's books on Russia, and Mr. Ralston's *Songs of the Russian People*, complete the volume. Although so varied in its composition, an internal unity is given to the book by the earnestness with which the author urges on his countrymen the necessity of studying the Slav world for themselves, instead of resting content with knowledge derived at second-hand from Germans and Poles.

A. J. PATTERSON.

*Kehrein's Mediaeval Latin Sequences*. [*Latéinische Sequenzen des Mittelalters aus Handschriften und Drucken herausgegeben*. Von Joseph Kehrein.] Mainz. 1873.

THE Latin of the Middle Ages is studied now for many reasons. But a little while ago he would have been a bold man who avowed that he read "monkish" authors for any other purpose than that of picking out the facts which their books contained.

The revival of learning did one part of its work very thoroughly. Like certain other revolutions, concluded and still in progress, it proved most successful on the side of destruction. It banished the middle Latin from schools and lecture rooms, reformed missals, breviaries, and hymn-books in a linguistic though not in a theological sense, and succeeded in compelling mankind to learn ideas which were of the very essence of the Middle Ages in a dialect that was nothing if not the speech of heathen Rome.

It yet sounds as a strange heresy in the ears of many to be told that Latin has always been a living language; that

till within the last three centuries it was by far the most truly living tongue in Europe, and that although there never has been a time when there was not bad Latin in plenty, yet the Latin of no age can be called bad simply because it differs widely from the Virgilian or Ciceronian standard.

It is a mere waste of time to discuss the degrees of merit possessed by a language in different stages of its growth. No man whose opinion is worth listening to could be found who would not willingly admit that, considered simply as literature, three or four of the great Roman writers are far more important than any of their more modern successors. There are not many persons either who would not be equally ready to acknowledge that as a medium for conveying delicate shades of thought, or the more refined harmonies of verse, nothing of the middle time can be put in comparison with the earlier Latin. On these matters it cannot be said with truth that there has ever been any doubt among reasonable men, least of all among those who were content to write their mother tongue—for it was the mother tongue then of all writers and thinkers—after the fashion of their own age and country. Every page of Dante's verse shows that he was steeped to the lips in the harmonies of Virgil, yet when he wrote in Latin he expressed himself as other people of his own time did, without any archaic affectations.

The idea that a language ought to be, or can be stationary, has only become absurd to most persons during the last few years. Until that conclusion had been reached it was impossible for men not to apply the terms bad and good to forms of language in a way that had absolutely no meaning whatever.

The growth of a tongue like the Latin, which had ceased to be a peasant vernacular, is very interesting in itself apart from all side issues. The side issues in this case however raise most of the theological and political questions of the mediæval time. We are told in almost every German school-book that Luther's translation of the Bible is the foundation of the present High-German speech. This statement is, of course, not strictly accurate, but taken with needful reservations it embodies a truth which it is very useful to have before us in a compact form. What Luther's Bible has been to the German-speaking folk the Vulgate and the Roman law were to the people who used middle Latin. When darkness settled down on the Empire, the compact Roman speech would have utterly gone to pieces had there not been at hand these two unquestioned authorities to act as standards of grammar and guides in word formation.

The influence of the Vulgate began much earlier and was always far wider than that of the law-books. They were only a small company at any time who were directly influenced by legal forms, but all men who in any sort knew Latin came in constant contact with Saint Jerome's version of Scripture every time they entered a church, or in any other way became participators in religious rites. The dialect of the Church service books was made up almost solely from the current Latin version of Scripture, and contained, until the grammar theorists of the revival began to meddle with it, hardly a conscious reminiscence of the classical form of the language.

The feeling against rhymed Latin has been stronger than against any other of the so-called "barbarisms" that the Middle Ages have left us. There is no doubt more to be said in its favour than of many other such like prejudices. Rhymes in a highly inflected language cannot give the pleasure of half surprise that they furnish in simpler tongues, they are so easy to make, and rhymes of the same sort are so constantly recurring that they soon pall upon the ear. There is also another difficulty which we feel much less in modern languages. In Latin the jingles have a habit of

being rung on the same parts of speech, most commonly on the same persons and cases. Though rhymes are far more numerous in Latin than in English or German, it is not nearly so easy to find them therein of diverse parts of speech as it is with us. As a consequence, when vernacular literature had grown up, and there were rich and varied rhymed poems in Italian, French, and English with which to compare the Latin hymns it was but natural that a form of verse which at its best was but narrow should be regarded as one of the silliest corruptions of a dark period.

Prejudice of this sort however, even when it might have a good deal that is sensible to say for itself, usually defends its unreason by weak arguments. The rhymed Latin was despised not because it was in some ways an imperfect vehicle for conveying poetical thought, but because nobody had written in this manner in the early time, and it was surmised that, could Virgil and his friends have read the compositions of Notker, Ekkehard, and Thomas Aquinas, they would have pronounced them to be abominable.

Until Dr. Herman Adalbert Daniel published his *Thesaurus Hymnologicus* very little was known about any of the mediæval hymns except those few which have still retained a place in the rituals of the Roman Catholic Church. This great collection, though imperfect in so many particulars, came as a revelation of a new world of beauty to many. It was soon followed by the *Laténische Hymnen* of F. J. Mone, a far less copious, but in many ways a richer collection. Daniel's *Thesaurus*—probably because it was the first book of the kind—attracted far more attention in this country than its successor. We probably owe to its influence a little collection of the same kind published by the late Warden of Sackville College. This book, though a mere selection, is very useful, as great pains were taken with the text; it is open to question, however, whether theological influences had not greater weight with the compiler than they would have had with one whose object in making the collection was purely historical. This book before us contains sequences only, but it is, as far as it goes, decidedly the most perfect collection we possess, more perfect than either of its predecessors not only because it contains poems which the previous editors have not seen or have ignored, but also because most laudable care has been taken to set right corrupt texts. All has not yet been done in this direction that might be, but it is clear to any one turning over the pages that very much has been accomplished, and the way paved for a really complete collection, where the texts shall be printed with at least as much care as we give to the less important among the Greek and Roman poets.

EDWARD PEACOCK.

#### LITERARY NOTES.

Roderick Benedix, whose comedies were among the most constant favourites of the German stage, died on the 26th ult. He was born in 1811, and after receiving a classical education declined to follow any of the learned professions, and joined a travelling troupe of actors, with whom he remained for some years; he was also not unsuccessful as a singer, having a fine tenor voice. In 1841 he produced his first comedy, *Das bemooste Haupt*, which had an immediate success that led to his adopting literature as a profession. His pieces are very numerous; *Dr. Wespe*, *Der Alte Magister*, *Aschenbrüdel* (the original of Robertson's *School*), are amongst the most popular; but the comic element, which is intended to depend more on situation than on character or brilliant dialogue, is sometimes of but very faint facetiousness. The author was no friend to the fanatical Shakespeare-mania of so many of his countrymen, and has left a work ready for publication which is partly an attack upon this fashion and partly a detailed criticism of Shakespeare's dramas.

The *Cornhill* (Oct. 1) contains the second of the very interesting series of papers on the French periodical press which we have already noticed. There is much to be said for the author's view that "criticism had reached its climax of perfection under Louis XV's reign, and has done nothing but degenerate ever since." The best French criticism is unsurpassable, and there has never been better French criticism than some of what used to appear in the *Mercur* about the middle of last century. The last publication of the Stuttgart "Literary Union" is a history of the German newspaper press in the sixteenth century. Printed news-sheets, we learn, first appeared with the name of *Zeitung* in 1505, but did not become numerous till about twenty years later. In 1566 newspapers multiplied with the alarm of the Turks, and numbered sheets were first published. A half-yearly publication, *Relationes historice*, which gave literary as well as political intelligence, first appeared at Frankfort in 1591, and continued to exist under various names till the Revolution. The first weekly newspaper was published, also at Frankfort, in 1605. The *Cornhill* also contains a very fair estimate of Southey's place in literature; without being at all unduly favourable, it reads rather like a rehabilitation, as a fair estimate of a writer who spent so much time in writing away his reputation almost unavoidably must.

In the *Revue des deux Mondes* M. Rambaud reviews and summarises the results of Zabiéline's learned and diffuse volumes on the private life of the Russian tsars and their wives in the sixteenth and seventeenth centuries. The author might be described as a more exact and erudite Miss Strickland, and his information about court etiquette, &c., is curious and instructive. It appears to have been the etiquette for the tsar's mother and her relations to govern until the tsar's marriage; then they usually tried to poison his wife, but if they failed and she lived to bear a son, according to constitutional usage the dowager went out of office and the wife and her relations came in. The author accounts for the barbarous way in which Russian women painted their cheeks red and white, and their eyes black, by their desire to realize the ideal of their popular poets, who talk of "a face white as snow, cheeks the colour of the poppy, and eyebrows black as sable."

In the *Contemporary Review* Mr. G. H. Darwin makes a valuable contribution to the discussion of the question whether a demand for commodities is a demand for labour, by suggesting the importance of the element of time in the exchange, i.e. whether the equivalent for the commodities or the labour is to be handed over immediately, and if not how it will presumably be employed in the interval; but the author has still to learn from Mr. Mill, whom he is controverting, how to make a sound argument not only intelligible but also pellucid and attractive.

The *Preussische Jahrbücher* for September contains the beginning of a long dissertation by K. Dieterich on Buckle and Hegel as representatives of the German and the English mode of treating the philosophy of history. The author perhaps exaggerates Buckle's "representative" character, but the criticisms on his exaggerated faith in statistics and his unscientific use of the word "law" are to the point.

*Im Neuen Reich* (Sept. 26) prints some forgotten contributions of Herder to the *Königsberg Zeitung* of 1774, when Hamann, who added a good many touches of his own to the review, was its editor. The paper is a summary review of recent German literature, and is too oracular in style to have much more than historical interest. Hr. Haym, who accompanies the reprint with the necessary comments, proves by circumstantial evidence that it was probably Kant who struck out a phrase of compliment to himself which stood in the original MSS.

We learn that Mr. E. W. Gosse, of the British Museum, has in the press a volume of Lyrical Poems. It will be entitled *On Viol and Flute*, and will have a frontispiece by Mr. W. B. Scott,

The Icelandic Literary Society has just issued its annual set of publications, but they contain remarkably little of general interest. Besides legal and statistical matter connected with Iceland, and the usual summary of the news of the world, there is nothing, except an illustrated work on Greek and Roman mythology. As about forty of the fellows of the society are Englishmen, who have presumably become so in the hope of obtaining reprints of rare sagas and so on, we think the learned president might publish something a little less local. There seems to be very little literary life in Iceland. What there is to be found not in the half-Danish capital, but in Akureyri, doubtless the most out-of-the-way abode of letters in the world.

We have received a little "Narrative Poem" by A. Trümpelmann (published by Kölling, Wittenberg), entitled *Perpetua und Felicitas*, which, though unequal, and decidedly tame in the theological arguments between the Christian martyrs and Stoic philosophers, contains some passages of considerable poetic grace and polish.

## Art and Archaeology.

Gavarni. *L'Homme et l'Oeuvre*. Par Edmond et Jules de Goncourt. Paris: H. Plon. 1873.

ONE of the first impulses of almost every one who reads this book will probably be to regret the absence in it of any specimens of Gavarni's work. No doubt that work is pretty widely known, and easy enough of access, but still the interest and value of a volume of this sort which professedly deals, not merely with the artist's life, but also with his performances, would be enormously increased by a few judiciously selected examples of different periods. Still there is no lack of interest in the book as it stands—the authors have an apparently genuine enthusiasm for their subject, an enthusiasm which does not prevent intelligent treatment of it, and we do not think that any one will think his time lost, who has devoted a few hours to reading this account of an artist who displays with singular decision some of the most remarkable characteristics of his country and his century.

Guillaume Sulpice Chevallier (for Gavarni was an assumed name, suggested by old Pyrenean associations) was born in 1804, and was apprenticed first to an architect, then to an instrument-maker, lastly to a machine-drawer. He began early to execute small drawings for various print-sellers, and in 1825 published an album of fantastic *diableries*. About the same time he accepted an appointment at Bordeaux with the modest salary of forty-eight pounds a-year. But his employment there was uncongenial, and after about a year he set out on his travels and very fortunately found a Maecenas in a certain M. Leleu, Government surveyor at Tarbes. Here he remained for some time, nominally in M. Leleu's employment, but really wandering about the mountains at his own will and pleasure, and occasionally executing Pyrenean and other costumes for the print-sellers. It was not till the autumn of 1828 that he returned to Paris, which, save for his English excursion in 1847, he seems thenceforward to have scarcely quitted. Of Gavarni's life in Paris—he appears to have adopted the famous signature in 1829, the year after his return—of his gradual acquisition of fame, of his advancement from fashion-drawing to higher subjects, of his installation among the celebrities of his time, MM. de Goncourt have given in this volume a full and interesting account, interesting, if they will pardon us for saying so, principally as exhibiting yet once more the life and manners of that generation of 1830, which no student of literature and art can ever weary of contemplating. It is not perhaps the very noblest side of this life which we have here presented, but the presentation is at least faithful, and so cannot be other

than valuable. But there certainly is in Gavarni's own words "une odeur de punch, de cigare, de patchouli et de paradoxe," about the history of the artist's pursuits and triumphs, friendships and loves. On the last mentioned point MM. de Goncourt are somewhat copious, and the recital is, in a manner, edifying. An endless succession of transitory *liaisons* with innumerable facile Louisas Arsènes and so forth, characterized by no faintest spark of passion, or even pretence of passion, neither betokens depth of nature, nor is calculated to deepen one already shallow. But it is at the same time valuable to us, as evidencing this very want of depth and passion. Of these there is no trace in Gavarni. He seems, indeed, to have had plenty of that peculiar filial affection which his countrymen, as if perversely bent on reversing the precept that a man should forsake father and mother and cleave to his wife, are so fond of displaying. But otherwise it can only be said of him "amavit multas," not "amavit multum." He had little or no enthusiasm even for his art, and could not understand it in others. Balzac, Lamennais, Delacroix are all unintelligible to him and draw from him judgments which are too crude to be harsh. All the faults which have been found with him as an artist arise from this very want of depth. His prettinesses and smartnesses, his "souliers vernis," and his "troupeau gazouillant de beautés d'hôpital," do not need to have their origin sought in his early fashion-drawing and machine-drawing. The cause lies deeper. As a copyist of manners Gavarni is admirable, almost inimitable. The "creator of the Lorette," as he has been called, the preserver for ever of the studentry and the carnival of Paris, can never be forgotten or discredited. But he does not inform his creations with any of the peculiar spirit which artists of the highest class in this kind, notably for instance his rival Daumier, know how to impart. Nor are the legends, often admirably witty, which he subjoins to his drawings, less characteristic. They indicate a certain defect: either legend or drawing ought to be superfluous. A curious story is told in this volume with reference to these legends. In Gavarni's studio you might see rows of stones, standing up-side down, the design apparently finished. Of these he would say, "Ils ne m'ont pas encore parlé."

We must refer our readers to the book itself for information respecting many interesting episodes of the artist's life therein depicted. Such for instance is the account of his visit to Clichy (he seems to have been always in debt), and his too attractive pictures of the humours of the place in the *Charivari*; which are said to have drawn so much attention that it became necessary to qualify them by exhibiting in the same paper the less jovial side of an imprisoned debtor's existence. Again there is the strange incident of the notary Peytel, already famous for the interest taken in it by Balzac and by Thackeray. It was through Gavarni that Peytel addressed his appeal to the King, accompanied by a request that the artist would furnish him with poison—a request with which Gavarni seems to have thought Louis Philippe expected him to comply. At a much later date there is the visit to England, which, though not unsuccessful in a professional point of view, was socially speaking a failure. This failure is frankly admitted by MM. de Goncourt, who however with the curious fatality which seems to attend French judgments of English character, attribute it to the vexation of the English aristocracy at the artist's delineation of London poverty and misery. The cause, one would have thought, is hardly so far to seek, when it is allowed that Gavarni was not only guilty of a gross act of personal disrespect to the Queen, but also of almost habitual discourtesy to Englishmen of letters, who sought his acquaintance and offered him hospitality. It seems however that for this he is rather to be pitied than blamed, as about this

time he became subject to accesses of a sort of mathematical and mechanical mania, which never left him till his death. Henceforward his art lost all interest for him, and was regarded merely as a bread-winner, all his spare time being spent in brooding over vague theories and vaguer projects. Unfortunately outward circumstances became unfavourable. He lost his favourite son; his house and garden, for which he had a great affection, were destroyed by some of the many "improvements" of the Empire; and his debts became more and more pressing. This later and melancholy period of his life is well and sympathetically portrayed by MM. de Goncourt, who have also furnished many interesting details as to Gavarni's method and style of working during these years, in which they were well acquainted with him. He died in 1866, having accomplished it is said during his life a total of ten thousand drawings, and having assured to himself "a place in the story" of French art and French manners. It would be impossible perhaps to obtain a better idea of Gavarni's character and powers than is given us in his own portrait of himself, rendered for this volume in an admirable etching by Flameng. Affectation, want of depth, questionable taste, may be urged against him, and can hardly be denied. But a fair critic must allow him at the same time a singular grace and attraction, an excellent and admirable wit, and above all an unsurpassed facility in grasping and rendering the manners and follies and fashions, the *quicquid agunt homines*, of his country and time.

GEORGE SAINTSBURY.

### THE CATALOGUE OF THE WILSON COLLECTION.

THE generous scheme of Mr. John Wilson for the benefit of the poor of Brussels has, we are glad to learn, met with the most decided success. Not only has the exhibition of his pictures, open since the 15th of August at the "Cercle artistique et littéraire" at Brussels, been largely attended, but the magnificent catalogue, to which we drew attention in the *Academy* of September 1, has been received with almost unprecedented favour, the second edition (the first consisted of a few folio copies for private circulation only) having been entirely sold out in the course of a few days. Those who, like ourselves, were too late in their application for a copy of this second edition will be rewarded for waiting by the superiority in many respects of the third, which is now ready, and which beside other advantages contains thirteen additional plates. The profits of this edition, as of the other, will be exclusively devoted to the charitable objects Mr. Wilson has in view. These we may hope will confer real and lasting benefits on those for whom they are intended. There is less fear perhaps at Brussels than in a large town like London of private munificence being misapplied and so doing harm rather than good.

But let none suppose that in buying a copy of Mr. Wilson's catalogue they are performing an act of charity, as many people fondly imagine when they give double its value for an article at a fancy bazaar. Here at all events they have the full worth of their money, Mr. Wilson disdaining, we imagine, to make the public sharers of his good work by imposing a charitable tax on the article he sells.

"Pour se payer aussi coûteuse fantaisie," says a writer in the *Gazette des Beaux-Arts*, alluding to Mr. Wilson's gift of the Constables to the Louvre, "il faut être puissamment millionnaire et légèrement excentrique, ou—pour tout dire en un mot—il faut être Anglais!"

But although Mr. Wilson's "slightly eccentric generosity" is, we are glad to hear, a proof of his being an Englishman, his artistic taste as well as his charity seems to be tolerably cosmopolitan. Among the thirty engravers and etchers employed on this catalogue we do not find one English or German name; all are French, Mr. Wilson being evidently an admirer of the modern school of French engraving. On the other hand the greater part of his pictures belong to the Dutch school of the seventeenth century. This marvellously productive school is represented in the catalogue by numerous etchings and engravings, several of

which are from some of its greatest masters' most noteworthy works. For instance the celebrated "Le Roi boit" of Jan Steen, one of the chefs d'œuvre of the collection, is at last engraved for us by Achille Gilbert, with felicitous effect of light, though the engraver has, we think, missed something of Steen's genial humour. From Rembrandt van Rijn, the chief of the school, we have the head of a man engraved by Ch. Courty, and the splendid head of a Jewish Rabbi engraved by Leopold Flameng in a manner that the great Dutchman himself could scarcely have excelled. There is but one other painting by Rembrandt—a Golgotha—in the collection, but his predecessor and in some respects his teacher, Frans Hals, a painter whose reputation has been greatly on the increase of late, is present in several portraits. One of these, "Jasper van Westrum," a somewhat supercilious-looking young gentleman, most carefully and delicately engraved by Charles Waltner, contrasts forcibly with "A young Fisher of Scheveningue," whose coarse features are admirably rendered by Paul le Rat. Another portrait, entitled "L'homme à la Canne," has the advantage of Leopold Flameng's skill in its reproduction, and is of course excellent in its execution; but in spite of the merits of the French engravers, we own we should have liked to have seen some of these subjects entrusted to Wilhelm Unger, who enters into the character of the Dutch masters more thoroughly than any other artist. "The Chief of the Moors," a magnificent portrait by F. Bol, almost worthy of his master Rembrandt, engraved with powerful effect by Frédéric Laguillermie; a quaint young Dutch lady with an enormous ruff and fan by Benjamin Cuyp, nephew of Albert, and several other portraits of great merit, give us a good idea of the portraitists of Holland. The landscapists are not quite so well represented, but we have a fine view of Dortrecht by Jan van Goyen and Albert Cuyp, engraved by Marie Duclos; a flat Dutch landscape with its single beauty of light and shadow, by S. A. Krausz, engraved by Léon Gaucherel; a moonlight scene with black clouds throwing impenetrable shadows, by Aart van der Neer, engraved by A. P. Martial; a ferry-boat taking passengers across a pleasant river, by Salomon Ruysdael—a more cheerful scene than those usually chosen by his brother Jacob—engraved by Gaucherel; two sea pieces—the sea at a dead calm in each—by Simon De Vlieger and Willem Vander Velde, engraved by G. Greux and Marie Louveau; an uninteresting Italian landscape by Pynacker; and a wild, dreary country, with an old lightning-struck oak for its principal feature, by Jan Wynants, one of the earliest painters of Dutch landscape. Strange to say, the Little Masters of Holland, as they have been called, whose works are usually so plentiful, have scarcely found a place in Mr. Wilson's collection. They are only represented in the catalogue by one etching by F. Flameng from a painting by A. Palamèdes of "La Claveciniste"—a lady richly attired in velvet, who gives you every advantage for studying her back hair and the faultless folds of her dress as she sits with her back turned upon you at the piano. As in the celebrated "Conseil Paternel" by Terburg, not a glimpse of the interesting creature's features can we gain.

Next to the Dutch school, the modern French school occupies the largest space in the Wilson catalogue. We have no less than three etchings from pictures by Eugène Delacroix, one of which, a lion devouring a rabbit, is magnificently executed by G. Greux; four from Jules Dupré; one especially fine etching by Ch. Courty of an autumn wood scene by Th. Rousseau; "Sheep and cattle at a stream," by Frozon, engraved by Lançon; "A view of Venice," by Ziem, engraved by Léon Gaucherel; "Christ among the doctors," engraved by A. Mongin from a water colour drawing of Decamps; and above all a lovely pensive evening scene by J. F. Millet, engraved with delicate sentiment of its quiet beauty by Ch. Waltner. Just two figures in a field arrested in their work by hearing the Angelus sound, and standing in strong relief against the evening sky with their hands folded in prayer, absorbed in pious thought. Of this engraving perhaps the greatest praise that can be bestowed upon it is that we hardly notice the etcher's perfect mastery of execution while admiring this true rendering of the painter's thought. With both painter and engraver we forget the artist in his work.

Of the English school, which was supposed to form the larger part of the Wilson collection, only four examples are illustrated in the catalogue. These however are excellent ones. "A Halt," by Morland, skilfully engraved by Paul Rajon; "The Widow and

Child," by Sir J. Reynolds, engraved by J. Jacquemart; a Landscape by Turner, engraved by G. Greux; and "The Drinking-place," by Mulready, engraved by Léon Gaucherel. Two Constables, notwithstanding the "eccentric" gift to the Louvre, still form part of the Gallery, and six other pictures of the English school, not engraved.

One picture by Rubens, rendered with splendid effect of light and shade by Ch. Waltner, and two portraits by Gonzales Coques represent the Flemish school of the seventeenth century, while the French school of the eighteenth is represented by engravings from works of Fragonard, Greuze, Lancret, Pater, and Perronneau.

Thus it will be seen, although we have not enumerated nearly all the sixty-eight engravings of this rich catalogue, that it is a work well worth possessing, and one that will form an important addition to an art library.

The present edition is limited to 1000 copies, which, in order to suit the wishes, or rather perhaps the purses, of all subscribers, are divided in the following manner:—

Nos. 1 to 40 on Whatman's paper, with all the new engravings before letters, 60 fr.

Nos. 41 to 100 on Dutch paper, with the new engravings before letters, 50 fr.

Nos. 101 to 300 with the names of painter and engraver only, 40 fr.

Nos. 301 to 500 on tinted paper, with the names of painter, engraver, and printer, 35 fr.

Nos. 501 to 1000 with the names as above and the title of the picture, 30 fr.

M. M. HEATON.

#### NOTES ON ART.

When the Castellani collection of gold ornaments was before the public awaiting a decision as to the desirability of its acquisition by the British Museum, the reports which appeared concerning it rarely omitted to point out that the exceeding fineness and minuteness of the ancient granulated gold work had entirely baffled all efforts at imitation on the part of modern goldsmiths. The secret by which globules of gold, so minute as to be scarcely visible to the naked eye, were made and separately soldered, to the number of thousands, into a pattern, was supposed to be practically lost to the modern craft, though preserved in a rude traditional fashion among the jewellers of St. Angelo in Vado, a remote village in the Apennines, as appears from Sig. Castellani's memoir on the subject. Since then, however, Sig. Giuliano seems to have completely recovered the ancient secret, not indeed as yet rivaling the finest specimens of Etruscan granulated work, but bidding fair to do so. Among the examples of this kind of work, exhibited by him at 13, Frith-street, Soho, are a gold bracelet and a pair of earrings, on the former of which are no less than 75,000 of these globules, arranged in patterns not slavishly copied from the antique, but always true to the antique spirit. Another splendid example of his work is the reproduction of the famous necklace from Milo in the Castellani collection.

The *Levant Herald* informs us of the removal of three bas-reliefs to Constantinople from the arch at Salonica commonly believed to have been erected on the visit of Constantine after his subjugation of the Sarmatians, though Leake (*Travels in Northern Greece*, iii. p. 244) was led by the character of the sculpture to assign it to the age of Theodosius. Leake describes what remained of the arch in his time as consisting of "two piers 14 feet square faced with stone, which were covered on all sides with a double range of figures in low relief representing the sieges, battles, and triumphs of a Roman emperor. A great part of the piers were concealed by shops of the bazaar, which cover all the lower parts of the figures on one side and the whole of them on the other." This description of the subject of the reliefs is confirmed by the sculptured part of the arch visible in the engraving of Cousinéry, *Voyage dans la Macédoine*, pl. iv., p. 29-30, Paris, 1831. It was therefore with some surprise that we read the interpretation which the *Herald* (as quoted by the *Pall Mall Gazette*, September 29) placed on the three reliefs in question, apparently on the authority of Dethier, the new director of the Museum of the Porte, and an archaeologist known at least for his services to the epigraphy of Constantinople. The three reliefs, it is said, make up together a scene from the hunt of the Calydonian boar, one of them representing

Meleager on horseback, the second a boar and a serpent twined round a tree, and the third two warriors advancing cautiously. The first is very suggestive of a Roman emperor, and the last is precisely the description we should expect of two Roman warriors as they are to be seen, for example, on the column of Trajan. It appears that several important sculptures were lately torn down from this same monument, shipped on board a foreign vessel, and in spite of the efforts of the police, conveyed away, who knows whither? At this the *Herald* raises its voice, including also in its denunciation of vandalism the exportation during the past few years of antiquities discovered in Cyprus, Ephesus, and the Troad. The treasure, intrinsically of very high value, found by Dr. Schliemann seems to have excited Levantine cupidity, and its loss to have aroused a strong feeling against foreign excavations.

The genial Dutch painter Jan Steen, whose character, it is well to remember, has been redeemed to a great extent by recent researches from the reckless imputations cast upon it by his earlier biographers, forms the subject of the first article in the current number of the *Zeitschrift für bildende Kunst*. A. van der Willigen, in his *Les artistes de Harlem*, 1870, published some documents which made it clear that Jan Steen was residing in that city at a time when, according to his slanderers, he was drinking the profits of his business as a publican at Delft. Indeed, the whole story of his keeping a tavern seems to rest upon the slender fact that he was the proprietor (probably by inheritance) of a brewery in Delft. These and the facts previously made known by Jan Steen's first vindicator, Westheene, are commented upon by W. Bode, the writer in the *Zeitschrift*, who does not, however, contribute any information of his own on the subject. The article is illustrated by two fine etchings by W. Unger from Jan Steen's works—one, a Flemish-looking Anthony and Cleopatra of which the original is in the library of the University at Göttingen, and the other—a scene more in accordance with the artist's jovial taste—a representation of a Bean-feast from the Cassel Gallery. This latter etching reminds one strongly of Hogarth; indeed the great Dutch and the great English humourist are allied in many respects, only the humour of the latter was almost invariably pointed with satire, whereas Jan Steen directed only blunt and harmless arrows against the follies and vices of mankind.

The current number of the *Jahrbücher für Kunstwissenschaft* still appears with the name of Dr. Albert von Zahn, although that distinguished art critic died suddenly, as before recorded, on the 16th of June last. The loss of its editor will, we regret to hear, bring the useful series of *Jahrbücher für Kunstwissenschaft*, which has now extended over six years, to an end. A memoir of the deceased critic and a review of his labours in art-history in the next number, will, it is announced, be the "farewell word" of that journal to its readers.

The present number contains: 1. A learned disquisition by Wilhelm Schmidt on the equestrian statue of the Ostrogoth king, Theodorich, in Ravenna and Aachen, a work that has given rise to much criticism and difference of opinion among German art critics.—2. An account and catalogue of an old collection of pictures formerly belonging to a Princess of Orange.—3. A description of Carsten's drawings and oil paintings in Copenhagen by Herman Riegel.—4. "Duke Albrecht I. of Prussia as patron of the two Cranachs," by Prof. A. Hagen.—5. "Who was the author of the *Abbrégé*?" by Julius Hübner, the *Abbrégé* being it seems an early catalogue of the Dresden Gallery published in 1782 with the title "*Abbrégé de la vie des peintres dont les tableaux composent la Galerie Electorale de Dresde*." The authorship of this *Abbrégé* is given by the writer of the article to Heinrich von Heineken on apparently sufficient grounds, but it is a matter of small interest.—6. A short notice of a carving by Andrea Verrocchio and a correction of Vasari.—7. An account of the discovery of a picture by the little known master Andrea di Bartolo di Maestro Fredi, by Dr. Ernst Förster.

Besides throwing open his gallery, and publishing a splendid catalogue of it for the benefit of the poor of Brussels, Mr. John Wilson has opened a public subscription for the same object, which hitherto seems to have been chiefly responded to

by members of his own family. Mrs. Thomas Wilson, of London, heads the list with £100, and several other Wilsons give £50 each.

In the *Hong Kong Daily Press* of July 1st (a curious source from whence to derive art intelligence) we find a detailed description and intelligent criticism of Holman Hunt's last picture "The Shadow of the Cross," which as yet few persons have been fortunate enough to see, and concerning which the critics of the London journals have been remarkably reserved. The article in the *Hong Kong Press* was not it appears written for publication, but was merely sent by the writer for the edification of a private resident in the colony, who, finding it interesting, forwarded it to the local paper. It is evidently written by some one well versed in art criticism, though it is free from the technicalities with which so many art critics overwhelm us. The strange symbolism of this remarkable work has been already explained. A nearly nude and well built Arab carpenter stands in his workshop at sunset, and indulges in a hearty stretch of his limbs after his hard day's work. By so doing his shadow is thrown upon the wall in the exact image of a crucified man, an effect that is perceived by his companion, a woman in a coarse blue robe, with her back to the spectator, who is on her hands and knees on the floor as if looking for something. Such is Holman Hunt's latest conception of the Virgin Mary and her Son, and "so thoroughly naturalistic," says the *Hong Kong Press* critic, "so purposely unidealized is the picture, that a friend well accustomed to art, who happened to see this painting without any previous knowledge of the subject, studied it, as he assured us, long and carefully, without the slightest idea that anything more than an ordinary piece of village life was intended."

The exhibition of this remarkable work will not, it is to be hoped, be much longer delayed. It is said to be now in the hands of an eminent London firm, but the report of its sale was authoritatively contradicted by the *Athenæum*. The Queen, it may be remembered, who saw this picture when Mr. Holman Hunt first brought it to England, has given him a commission for a repetition of an important portion of it.

Edmond J. B. T'Shaggenz, a well known animal painter of Belgium, has lately died at Brussels. His last work, not yet published, but exhibited in Brussels in 1869, was a series of water colour drawings representing the anatomy of the cow. To this work it is said he devoted many years of study.

Georg Friedrich Ziebland, the chief architect employed by Ludwig I. of Bavaria at the time when he was decorating his capital of Munich, died recently at the age of 73.

The Louvre has recently acquired, we learn from the *Chronique*, an interesting and important addition to its mediæval collection in the shape of an effigy of Blanche of Champagne, wife of Jean I., Duke of Bretagne, who died at the end of the thirteenth century. The figure is of Limoges enamel, and was executed at Limoges in the fourteenth century by the old process. It is made of a number of plates of copper fixed with nails on to a wooden mould, and is supposed to be almost unique of its kind. The destruction in some places of the copper plates render the process of its manufacture clearly visible.

The statue was formerly in the old Abbey of Hennebont in Bretagne. It is now placed provisionally in the Salle of Jewish antiquities in the Louvre.

A new and great picture (great, it is said, in every sense of the word, but certainly in size) by Hans Makart is now being exhibited at Vienna. It represents Venice doing homage to Caterina Cornaro, and contains no less than thirty-nine figures of life size. Bruno Meyer, in an article upon it in the *Beiblatt zur Zeitschrift für bildende Kunst*, accords it warm praise, and considers it the greatest triumph of Makart's art.

A painting of Venus and Tannhäuser by the rising Hanoverian artist Otto Knille is also creating some sensation in Germany. It has been lately added to the Berlin National Gallery.

The death on October 1 of Sir Edwin Landseer, R.A., at the age of seventy-one, has removed one of the most remarkable and certainly the most popular of the modern school of British artists. His life and genius have already been discussed in various journals at considerable length, and we therefore think it better to postpone our own criticism until the appearance of the memoirs which no doubt will be prepared without loss of time. The warm recognition which his works met with in his lifetime and the general grief with which the news of his death was received are gratifying indications of the soundness of our national taste.

Cornelius Varley, the brother of that John Varley to whom Mulready, W. Hunt, Copley Fielding and several more of our best English artists owed their training; the brother-in-law of Mulready, and the father of Cromwell Varley, the well-known electrician, died on the 2nd October at the age of ninety-two. He was the only survivor of the sixteen original members of the Society of Painters in Water Colours, and in the last years of his life could boast that he had exhibited longer ago than any other living painter.

Some interesting particulars with regard to the Varleys and their pupils will be found in the *Memorials of William Mulready*, by F. G. Stephens, published in 1867 by Bell and Daldy.

### Correspondence.

#### THE ORIENTAL CALIGRAPHS OF THE LATE FREDERICK AYRTON, ESQ.

To the Editor of the ACADEMY.

SIR,—I could scarcely believe the report which appeared in the journals some weeks ago that the Trustees of the British Museum had declined the bequest of the late Mr. Frederick Ayrton's collection of Oriental caligraphs. It is known now, however, from a trustworthy source, that the statement is correct, and that the Trustees deemed it impossible for them to accept the bequest under the conditions attached to it.

Having been at some trouble to secure a copy of the will, I am able to give the following extract therefrom bearing on the subject:—"I give and bequeath to the Trustees of the British Museum all my caligraphic writings in Turkish, Arabic, and Persian, which are in my opinion worth one thousand two hundred pounds, on condition that the said Trustees do set a room apart in the Museum for the display of these valuable specimens of Oriental caligraphy, about which little or nothing is known in Europe, artistically, and also on condition that they appoint the said Assaad Effendi Mazher [he had been made a legatee in a preceding part of the will] to prepare a catalogue raisonné, which will take some three or four years; and there ought to be a general series of numbers, then a series for each writer, with an account of the contents of each piece or book, and a short account of each writer: that would occupy one side of a folio; the other side would receive the translation into English, and the whole should end with a *Silsilat-d-Khattatin* [Catena of Writers]. One hundred pounds a year for such work would not be too much to be paid to the said Assaad Effendi Mazher, which, with what I have hereinbefore given him, [£4,000 in Turkish five per cent. bonds] will enable him to live comfortably."

The only one of these conditions to which the Trustees could demur was that of providing "a room" wherein to display the caligraphs; for I cannot bring myself to believe that the outlay of from £300 to £400 for the compilation of the suggested catalogue swayed their decision. But did they deem it worth while to inquire whether the executors would not have been satisfied with a practicable compromise of the first condition? If they did not, I can only say that their remissness was unpardonable. It may be, however, that another motive actuated them, one which appears to have been put forward in their defence by a writer in the *Athenæum*, who asserts that these caligraphs have no literary value, and that Dr. Rieu, who is in charge of the Arabic MSS. at the Museum, was quite capable of drawing up the proposed catalogue, which was a work proper to his department. Should such be the fact, the case as against

the Trustees is still stronger; for there is reason to believe that the MSS. were examined very cursorily indeed. Moreover, with all due deference to Dr. Rieu, I venture to question his qualifications for judging of Oriental caligraphy. The testator, who was an experienced connoisseur, states that little is known in Europe, artistically, of Oriental caligraphy, and judging from the wretched specimens of type in which most Arabic and Persian works are printed, both here and on the continent, as well as from the very high opinion, in that respect, which the Museum authorities seem to entertain of their existing collection—among which there are very few specimens indeed of first-rate writing—he was not wide of the mark.

But supposing, for argument's sake, that these MSS. were worthless from a literary point of view, surely the Trustees or their advisers ought to have known something of their possible value as works of art. Or do they need to be informed that in consequence of the restrictions imposed by Islâm, which prohibits the making of images and pictures, the Muslims at a very early period of their history were driven to avail themselves as well of caligraphy as of geometry for the purposes of ornamentation, and that in the course of time the most elegant devices were constructed from both those sources, inasmuch that a fine specimen of handwriting is to this day appreciated by educated Muslims as highly as connoisseurs among ourselves appreciate a painting by Raphael or Murillo; and, moreover, that such specimens are of high repute, and that the writers are regarded as historical personages, whose biographies are cherished with a veneration equal to that in which we hold the lives of our most eminent painters? The flexibility of the Arabic character afforded ample scope for ornamental and decorative constructions, and among these specimens collected by Mr. Frederick Ayrton I am assured there are many which would excite the admiration not of Muslims only, but also of European artists and limners. The facilities which Mr. Ayrton possessed during his twenty-five years' residence in Cairo for obtaining these exemplars—many of which were purchased from decayed families driven by want to part with them—are not likely to fall to the lot of any other person, and although he modestly values them at £1,200, there is reason to believe that he paid much more for them, and that their marketable price may be estimated at a much higher figure. Besides, he was a *littérateur* himself, and his profound critical study of Oriental caligraphy is of itself a sufficient warrant for the worth of his collection.

The following summary may serve to convey some idea of the extent and character of the MSS. contained in the bequest. They number upwards of seven hundred, consisting of volumes, portfolios, scrolls, and sheets, in the Kufic, Naskh, Thulth, and Taa'lik character, some written in gold and others beautifully illuminated. The date of some goes as far back as the seventh century of the Hîgrah; many are the work of the most famous caligraphists; and all are considered of great value by the best living Muslim judges. Six of the scrolls are almost unique, only another copy of them being known to exist in the Prophet's mosque at Mekkah. As a specimen of modern caligraphy, there is a silver casket containing the inscriptions on the *Mizab-u'r-Rûhmah*, or Water-spout of Mercy, over the Kaa'bah; also a small plate of gold, with engraved Arabic characters, being the model submitted by the artist 'Abdallah Bey Zuhdy, to the late Sultân 'Abdu'l-Majid, who restored the Water-spout. The only duplicate of this casket and its contents is deposited in the Imperial Treasury at Constantinople.

I have no hesitation in saying that those who are responsible for the loss of this collection by the British Museum deserve the severest censure. The loss to the nation arising from the refusal on the part of the British Museum would have been complete, but for the public spirit and generosity of Mr. F. Ayrton's widow, to whom the collection reverted on its refusal by the Trustees. Desirous of carrying out her husband's wishes as far as was now practicable, she has offered it to the Museum of the India Office, and I confidently hope that the Secretary of State for India in Council will know better how to estimate a bequest which, as I venture to predict, will be to Orientalists generally, European and Indian, one of the greatest attractions in that institution.

### Physical Science.

#### THE GERMAN SCIENTIFIC AND MEDICAL ASSOCIATION.

THE forty-sixth *Versammlung deutscher Naturforscher und Aerzte* was held at Wiesbaden last month, the session commencing on the 17th and ending on the 24th. The attendance of members and associates was very large. Three days were devoted to general meetings and three to the meetings of sections.

The sections numbered in all eighteen, nine of which had for their object the discussion of subjects relating to medicine and surgery, and the branches of science in any way allied to them. Among those attending and presiding at these sections were Baum, von Langenbeck, Roth, Max Schulze, von Tröltsch Lieberkühn, and Rindfleisch.

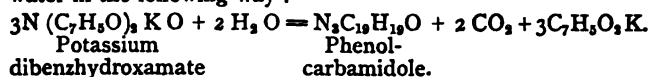

In the Section of Anthropology the presidents were von Cohausen, the director of the museum at Wiesbaden, and Prof. Lucae, and one of the most important papers read was that contributed by Prof. Virchow on the characteristics of the skulls of savage races. Wibel described some barrows on the north coast near Hamburg in which he found implements of iron plated with bronze.

Geography was represented by Rohlfs, who read a paper on the proposed expedition to the Libyan Desert, Neumeyer, Radde, Schweinfurth, and Friedrichsen. Dr. Ascherson made a communication about Lorenz's journey in South America. Dr. Neumeyer described the proposed uniform organisation of meteorological observations, which formed the subject of discussion at the recent congress in Vienna, and to which attention has been directed by Mr. Scott in *The Times* of the 1st instant.

A great number of papers, almost without exception on organic chemistry, were read at the Chemical Section, which was more largely attended than any other.

Tollens directed attention to the fact ascertained by Philippi that the bibromopropionic acid, or  $\alpha$  acid, of Friedel and Machuca prepared from bromine and propionic acid, differs in its properties from the isomeric  $\beta$  acid prepared from brominated allylic alcohol. With hydrogen the one forms propionic acid, the other acrylic acid. Tollens finds that the  $\alpha$  acid when treated with potash forms on separation of hydrobromic acid monobrom-acrylic acid, which on again taking up hydrobromic acid forms bibromopropionic acid, not the  $\alpha$  acid however but the  $\beta$  acid. This is of importance as it shows the analogous constitution of the two acids and indicates the presence of the carboxyl group

in the  $\beta$  acid, and consequently in the acrylic acid produced from it; this had hitherto been doubted. The monobromacrylic acid, produced by the action of potash on the  $\beta$  dibromopropionic acid, resembles very closely the acid above mentioned; it forms with hydrobromic acid  $\beta$  dibromopropionic acid, its potash salt however has very different characters.—By boiling sugar with dilute sulphuric acid Tollens and Grote have obtained an acid the zinc salt of which has the formula  $C_8 H_7 O_3 Zn$ . It appears to be a lactic acid deficient in hydrogen of the valeryl series.—An investigation of the compounds of starch with potash and soda has been made by Tollens with the view to determine the molecular constitution of starch. The apparently thoroughly pure compound contained one atom of metal to four or five molecules of starch, which corresponds to twenty-four or thirty atoms of carbon.—Dr. Wibel showed a new and simple form of water-pump for the suction of air. The glass tube which the water descends has the diameter of small combustion tube which for the space of about three inches is contracted to a uniform bore of from 2 to 3 mm. At the bottom of this contracted part just before it enlarges to its original diameter a glass tube of equally narrow bore is let into it horizontally. As the water falls it draws the air out of this lateral tube with great force.—Graebe read a paper on the constitution of rosaniline. To arrive at a knowledge of its composition the author first endeavoured to settle the vexed question of the composition of the acid arising from the action of nitrous acid on rosaniline. He has now proved beyond all question that it has the formula  $C_{20} H_{16} O_8$ , and he retains the name rosolic acid for the acid obtained from rosaniline by the above method; leucorosolic obtained by the reduction of the above compound has the composition  $C_{20} H_{18} O_8$ . The relation in which rosolic acid stands to aurin has not yet been clearly established. Both bodies yield very characteristic compounds with bisulphite which are readily purified. When perfectly pure rosolic acid is employed colourless solutions are obtained. Just as rosaniline forms with hydrocyanic acid a colourless base, rosolic acid forms the compound  $C_{20} H_{16} O_8, HCN$ , which comports itself like an acid or a phenol. Again, both bodies unite with acetic anhydride to form colourless compounds. When heated with water to  $200^\circ$  rosolic acid forms a colourless crystalline body identical probably with that obtained by Liebermann from rosaniline.—Oppenheim has examined anew the product of the action of oxide of mercury on benzamide for the purpose of determining whether it is one of substitution or addition. He finds that it is a substitution product with the formula  $Hg(C_7 H_5 ONH)_2$ .—Lossen contributed a paper on the amide derivatives of hydroxylamine, in which he announced the discovery of a new class of bodies which he terms *carbamidoles*. While dibenzhydroxamic acid is decomposed by baryta water into benzhydroxamic and benzoic acids, its potash salt is decomposed by water in the following way:

Phenyl-carbamidole is sparingly soluble in cold and moderately soluble in warm alcohol, insoluble in water, and crystallizes in brilliant prisms. It melts at  $200^\circ$  and can even be distilled without suffering decomposition. It combines neither with acids nor alkalis, but when heated with concentrated hydrochloric acid for several hours to  $180^\circ$  it takes up water and decomposes into aniline and carbonic acid:

Wislicenus gave a short description of his research on ethylene-lactic acid, a fourth modification of lactic acid, and of the difficulties he encountered in preparing pure compounds through the fact of its salts showing no tendency to crystallise.

In the Botanical Section Pringsheim gave a brief sketch of his investigations on the ramification of the *Sphacelariae*. According to Magnus, who made some remarks on this communication, there were two modes in which it takes place. In the one the new shoot is formed by an oblique partition cutting off a segment from the youngest cell of the part about to branch. The segment eventually pushed the weaker cell from which it was derived, to one side and a sympodial ramification resulted (*Stylocaulon*). In the other mode a lateral shoot is formed by a bulging out from a cortical cell (*Sphacelaria*), which bulging out subsequently developed into a branch.—Pfeffer discussed

the part played by light in the reconstruction of albuminoids from the asparagine contained in the young shoots of the *Papilionaceae*. He had already shown that asparagine is the form in which the proteinaceous nutriment of the germinating plant "wanders" from the points where it has been stored up to the growing parts where it is again converted into albuminoids. When such plants are exposed to light asparagine is not found in the growing parts, though it is abundantly present when they are kept in darkness. The influence of light, however, upon the conversion of asparagine into albuminoids appears to be only indirect. It is richer than these substances in nitrogen and poorer in carbon and hydrogen. In its formation from an albuminoid there must be a separation of the two last elements which, in turn, must be added to it when the albuminoid is reconstituted. When however a plant grows in the dark the demands of its growth and respiration consume all its available non-nitrogenous material. Asparagine then accumulates because there are no materials for its reconstruction into an albuminoid. But when the plant is exposed to the light these materials are supplied by the normal activity of the leaves and the asparagine consequently disappears.—Askenasy described the growth of the fruit-pedicle (*seta*) of *Pellia epiphylla*. It was divisible into two periods, during the first of which there was continuous multiplication of cells by division but scarcely any elongation. On the other hand during the second period, which lasts only from three to four days, cell-multiplication stopped, but the length increased from 1.2 to 80 millim. This was accompanied by a total consumption of the starch contained in the cells.

Among the papers communicated to the Physiological and Pathological Sections were the following:—Köhler, of Halle, gave details of experiments undertaken with a view to determine the physiological action of bitter substances upon the circulation and blood-pressure. He found that when cetrarin, columbin, and other bitter substances were injected into the veins a decrease of blood-pressure amounting to from 8 to 20 mm. of mercury first of all occurred in the arteries, which was subsequently followed by an increase to the extent of from 12 to 18 mm. above the tension previous to the injection. The cause of the diminished pressure which occurred even after the spinal cord and the vagus had been divided is to be looked for in the heart, that of the rise which did not occur after section of the spinal cord *outside* of the heart. The augmentation of blood pressure after injection of cetrarin and columbin can only be referred to excitation of the vaso-motor centre. It is difficult to say whether the acetic acid required as a solvent may not have aided the effect. The primary diminution of pressure results from paralysis of the termination of the vagus in the heart. The primary diminution is observed both in acid solutions of cetrarin, and in solutions of cetrarin in distilled water. The frequency of the cardiac contraction when lethal doses of bitter substances have been given remains unchanged up to a short time before death.—Langerhaus made some observations on the structure of the eye of the lamprey. The globe of the eye in this animal is peculiar in being destitute of any sclerotic coat, and the choroid is directly continuous with the membrana descemetii. In ammocaetes the latter membrane is very strongly developed and completely fills the anterior chamber. The iris is simply a continuation of the retina, which is attached to the choroid by a thin layer of connective tissue. As Max Schultze has shown, several layers are present in the retina. Inside the external granule layer is found the ganglionic layer, in which a double row of large ganglion cells are separated by a layer of fibres. Within the ganglion-layer lie the internal granule layer, the optic fibre layer, the granulosa and limitans interna. Processes are given off from the external ganglion-layer which penetrate the lamina granulosa externa. The granules of the rods and cones dilate to form cup-like bodies which likewise stand in connection with the granulosa externa, and these cups are situated like Hauben? upon the processes of the ganglion cells. Thus it is rendered highly probable that there is a direct connection between the connective tissue cups and membranes of the granules and the connective tissue of the granulosa externa, and, on the other hand, between the nervous contents with the processes of the ganglion cells.—Grünhagen read a paper showing that temperatures between  $0^\circ C$ . and blood heat exert a varying influence on the size of the pupils of

mammalian eyes which have been extirpated. The pupils of a cat's eye when exposed to blood heat, after the death of the animal, become widely dilated, and if the temperature be lowered to about that of an ordinary room they strongly contract and on further cooling to freezing point they again become strongly dilated. Grünhagen concludes that no contraction or relaxation of the sphincter pupillae takes place as Brown-Segard and H. Müller believe, but that the phenomena are due to a differing capacity for imbibing fluid which the iris possesses at different temperatures. He holds that the tone of the tissue of the iris is lost immediately after death by the absorption of water, whilst on exposure to great cold water is again given off. That water is really given off in the latter case is rendered probable by the reaction of the lens to cold which is rendered cataractous at 0° C. owing to the formation of vacuolae in its substance. The lost excitability of the musculature of the iris can be restored even after the lapse of two days if the iris be again exposed to a blood heat. Grünhagen further showed that on cooling the muscular tissue of frogs to 0° its disposition to react upon the application of a mechanical stimulus or its excitability was greatly increased, and that by this means it is possible to demonstrate muscular contraction without participation of nerves. The contractions so produced can produce secondary convulsions.—Thoma described the migration of white corpuscles into the lymphatics of the tongue of the frog. He injected the lymphatics of the living animal with an extremely dilute solution (1-2000th or 1-8000th) of silver nitrate, and found that with certain precautions this did not lead to stasis of the blood in the blood-vessels, but only to a lively exodus of the white corpuscles from their interior. After a time the re-entrance of the corpuscles into the vessels through certain stomata in their walls, marked by a precipitation of the silver, is observed. In a second series of experiments the lymphatics were injected with a dilute emulsion of cinnabar in a three-quarters per cent. solution of common salt. The cinnabar is in part deposited in the stomata of the lymphatic vessels, partly passes through them and is deposited in the tissues in the form of small round cloudy patches. The evidence of the identity of the stomata brought to view by means of cinnabar with those rendered apparent by means of silver nitrate is obtained by their peculiar grouping in the lymphatics of the frog's tongue, and, secondly, by the subsequent injection of silver nitrate into the same vessels. The injection of cinnabar causes very little disturbance of the circulation. If a lively exodus of the white corpuscles from the blood-vessels be produced by making an abrasion of the surface the migrating cells quickly make their appearance in the stomata of the lymphatics marked out by the cinnabar. They then take up the particles of cinnabar into their interior, which causes them to lose their activity and accumulate in the stomata. They immediately appear in the form of cauliflower-like excrescences projected on the inside of the lymphatics which break up into thin constituents—cinnabar-holding cells. These are seen in motion in the lymphatics, and may be traced thence into the cervical lymphatics and into the blood. In these researches a remarkable uniformity in the track pursued by the white corpuscles was observed. They then pass from the vessels into the tissue by a series of sharp zig-zag movements, and all travel at about the same rate.

In Section 5 (Mineralogy, Geology, and Palaeontology) the presidents were von Dechen, Koch, von Zepharovich, and Geinitz. Prof. Sadebeck, of Kiel, alluded at the opening of the meeting to the death of Gustav Rose. Distinguished, he said, by his searching critical gift of investigation, he had always selected the most abundant minerals for examination. To him we owe the means of distinguishing monoclinic and triclinic feldspars, a discovery which he moreover applied to petrography and opened the way in Germany for the investigation of finely granular and compact rock-masses in microscopic sections. The relations of chemical and physical properties to crystalline form were placed on a definite basis by him. He took the most active part in the development of the doctrine of zomorphism; it was he who deduced the relation of electrical polarity to crystalline form in tourmaline and pyrites. Again, in descriptive crystallography he was the first to bring into use the graphic method, now known as Quenstedt's method of projection, and to devise the best method of drawing crystals. The third edition of the only text-book which he published, that

on the Elements of Crystallography, was about to appear, but he did not live to see it through the press. All who knew him will ever remember the gentle, kindly, noble Gustav Rose. We can adopt no better means of honouring his memory than by pursuing the work which he has broadly marked out for us. His labours not only yielded abundant results, but indicate to students of his science the proper method of further investigation.—Dr. Ochsenius announced the discovery of glauberite at Wester-Egeln in North Germany. He directed attention to the fact of salt beds, like those of Kalucz, Stassfurt, and Leopoldshall, having been found within the last few months in this locality, and traced the many resemblances between them and the corresponding deposits in Peru, Bolivia, Chili, Orinoco, &c. The small depth at which they are met with is due to an upheaval, which is easily apparent at Wester-Egeln and at Tarthun. The clay beds overlying the glauberite resemble those of Wieliczka and Hallein, and differ from those of Stassfurt, in containing distorted crystals of rock-salt. Their faces however are not hollow but convex and sometimes show octahedral faces. Their appearance recalls the so-called rhombohedra of quartz from the keuper of Göthj and the zechstein of Frankenburg. Pyrites is sometimes found on their faces, an association of great rarity at Stassfurt. At greater depths crystals of red rock-salt have been met with, which in their hemihedral form resemble a corresponding well-known variety of galena from the Hartz. Boracite also occurs at Wester-Egeln, and hydroboracalite has recently been found at Stassfurt. The discovery of these minerals supports the view advanced in 1839 that Wester-Egeln forms the centre of the Magdeburg-Halberstadt basin.—Prof. Sandberger in describing the crystalline rocks of Nassau showed that the palaeozoic rocks bore a striking resemblance to those of tertiary times, a diabase, for example, to an old basalt or dolerite. The silurian diabase consists of oligoclase, augite, hexagonal titanite iron, and only differed under the microscope from dolerite in that olivine was more sparsely present. The green constituent of diabase, which has not yet been isolated and analysed but is supposed to be a product of the decomposition of augite, occurs with great distinctness at Kupferberg in the Fichtelgebirge. In Nassau and in other districts of South Germany phosphorite and staffelite are only met with at places where diabase has reached the last stage of disintegration, and the same phenomenon is noticed at Rossberg near Darmstadt in the case of tertiary rocks. Phosphate of lime is less soluble than carbonate, and constitutes a material for the petrification of corals and the formation of beautiful pseudomorphs after calcite. The iodine of staffelite and osteolite must have been derived from the diabase and basalt and must be present in other volcanic rocks. New localities for olivine were mentioned: a dark black-green rock from Tringenstein contained much olivine, the greater part of which was already converted into serpentine, the transition being beautifully shown in some microscopic sections. The author of this paper shewed an interesting series of specimens from an obsidian stream, of El Guamani, sent him by Reiss, showing the gradual transition of obsidian through typical perlite into trachyte.—Prof. Möhl, of Cassel, read a very elaborate paper, which it is impossible to condense, on the mineral constitution and distribution of phonolite, illustrated with many hundred rock-sections and thirty beautifully executed plates that are to appear in his forthcoming work. He finds that tridymite occurs in abundance and beautifully crystallized in the haüyne-phonolite of Javalato Lazio (Vesuvius) and Hohlstein (Rhône), and in the nepheline-phonolite of Milseburg, Bubenbad, Pferskopf, and Alschberg, and in the mica-phonolite of Teneriffe.

Dr. Flight read a paper by Prof. Story-Maskelyne and himself on the method of determining silica by distillation with hydrofluoric acid, and described the apparatus which is employed in the British Museum Laboratory for that purpose. A number of important precautions that are to be taken in conducting an analysis by this process were given, and the peculiar advantages attending it were pointed out. Meteoric augite, enstatite, bronzite, and other silicates that do not gelatinise with acid, as well as asmanite, have been analysed in this manner.—Another paper directed attention to some crystals of phosphorus which had been made by Mr. W. Douglas Herman and measured by Prof. Story-Maskelyne. These crystals are

formed by the spontaneous evaporation of ordinary phosphorus in vacuo and in darkness. In a few weeks they attain a considerable size, a length of from three to five mm., and are of great beauty. They are colourless, transparent, possess great refractive power, and bear a great resemblance to cut diamonds. Only a short exposure to light renders them yellow and opaque. The crystals belong to the isometric system, and exhibit a very great number of faces.

A note was then read by Dr. Flight on some observations made by Prof. Story-Maskelyne and himself on the colour of diamonds. It was mentioned that in 1867 there was exhibited in Paris a diamond possessing a rose colour which, after the stone had been exposed for a few minutes to diffused light, completely faded away. A straw-coloured diamond from the Vaal River when heated in a porcelain tube to a red heat in an atmosphere of hydrogen lost all colour, but recovered it again by a few minutes' exposure to diffused light. Various experiments were made: by employing a more intense heat, by using chlorine in place of hydrogen, by preserving the diamond, for some days in the dark, after it had been heated; in each case exposure to light for a few minutes restored the lost colour. It was suggested that this phenomenon may be intimately connected with the phosphorescent properties of the diamond.

Prof. Zirkel gave a short *résumé* of the contents of his new work on the microscopic characters of minerals and rocks.—Prof. Laspeyres described and exhibited some curious glacier markings of diluvial times on a slab of porphyry from Quetz, near Halle.

The lectures at the general meetings were by Prof. Neubauer, on "The Labours of Liebig in the development of Physiological Chemistry"; Prof. Oscar Schmidt, on "The Theory of Descent in its Application to Man"; Prof. Virchow, on "Natural Science in its Relation to Moral Training"; Prof. Sandberger, on "The Upper Rhine Valley in Tertiary and Diluvial Times"; Dr. Snell, on "Scientific and Medical Views Contrasted with the Present Interests of Education"; Dr. Radde, on "The Steppes of Russia"; and Prof. Meynert, on "The Mechanical Structure of the Brain."

Further notices of papers read at this meeting will appear in our scientific notes.

The next meeting will be held at Breslau.

### History.

Ritter's History of the German Union. [*Geschichte der deutschen Union von den Vorbereitungen des Bundes bis zum Tode Kaiser Rudolfs II. (1598-1612)*. Von Moritz Ritter.] Baader: Schaffhausen. Bd. i., 1867. Bd. ii., 1873.

It is perhaps a feeling of pride in the restored unity of their country which is sending so many German writers to search into the records of the Thirty Years' War. Those who have lived to see their country revive can tell without a blush how their country fell. And those who remember Herr Ritter's first volume as long ago as in 1867, will be glad to welcome this further instalment of his work in 1873.

The subject which Herr Ritter has chosen is certainly a proof of his great self-abnegation. In its whole course the Union never did anything much worth doing, and it expired unlamented amidst the sneers alike of those who forsook it, and of those who trod it to the ground. All the more thankful ought we to be to a writer who will tell us impartially what it was and what it tried to do. And this is just the quality in which the book is most conspicuous. It is, one must confess, especially in the first volume, a trifle dreary. But how could it be otherwise when it has to tell, page after page, how a number of Protestant princes believed themselves to be in the greatest peril, which could only be averted by forming some sort of league amongst themselves; and yet how, when it came to the point, they never could make up their minds on what terms the league was to be contracted, or could even agree to allow that anybody whatever should give way to anybody else. And yet this seems to have been the normal condition of affairs with the German Protestants during the last quarter of the sixteenth century and the first few years of the seventeenth.

Soon after the commencement of the second volume, we come upon more interesting ground. The peculiarities of the Austrian federation are well brought out, and its unsatisfactory political condition is shown to make a collision between the ruler and his subjects almost inevitable; quite inevitable, we may perhaps say, when a grave religious dissension was added to the struggle between monarchy and aristocracy. But the main interest of the book lies in the progress of the German disunion. It should be read as a companion to Gindely's *Rudolf II.*, taking as it does

rather a more favourable view of Christian of Anhalt's character than Gindely is inclined to take. But the main points are the same in both writers, as are the main points of the character of Maximilian of Bavaria. On one side we have the feverish activity of a man who believes that nothing short of a revolution will be of any use; on the other side we have the law-loving attachment to ancient forms, which nevertheless contrives now and then to misinterpret the law in its own favour. And then comes the seizure of Donauworth, of which we have all read so often, but which gives occasion to Herr Ritter to explain the religious and political position of these South German Towns, in a way which reminds us of Ranke's clear exposition of the religious and political position of the North German Bishopricks in his essay *Zur deutschen Geschichte*, and which should be borne in mind by any one who wants to understand the fate of these towns under the Imperial Commissions in 1627 and 1628. The last volume yet published comes to an end with the formation of the Union at Ahausen in 1608. The third and final volume is to bring us down to the death of Rudolf II., in 1612, and will of course include the war of succession in Cleves; and we can only hope that it will be equal in merit to the second volume, which is decidedly an improvement upon the first both in manner and in matter.

Possibly some of our readers may like to see how Christian of Anhalt, the shifty diplomatist, wrote to his wife. Here then is an extract (ii. 151).

"Et certes, sans flatter, j'affirme constamment qu'aux perfections tant du corps que d'esprit il n'y-a dame laquelle vous surpassa; laquelle seule félicité Dieu m'a permis de sa divine libéralité l'ayant dénié un tel bien a tant de millions des hommes. C'est pourquoy que j'ay tousjours dont je me puis resjouir par la douce souvenance de vos faveurs. Et, ma divine dame, je me jette totalement en vos bras, vous baisant un million de fois les belles mains, m'assurant que Dieu me rendra tousjours de plus en plus capable, afin que je puisse perpétuellement servir, chérir et honorer vos beautés et rarités angeliques, ce que me fait oublier l'obscurité et fange de ce monde ténébreux, et soupanser avec grand désir à la clairté et gloire qui est tout lumière et béatitude éternelle."

This habitual use of the French language must have told in the end against the Unionist party. They were not only revolutionists, but they were un-German. Maximilian of Bavaria or George of Saxony would as soon have thought of writing to their wives in French as Pym or Cromwell would have done.

SAMUEL R. GARDINER.

**Narratives of the Rites and Laws of the Yncas**, translated from the original Spanish manuscripts and edited, with Notes and an Introduction, by Clements R. Markham, C.B., F.R.S. London: Printed for the Hakluyt Society. 1873.

MR. MARKHAM'S new volume contains, 1st, *An Account of the Fables and Rites of the Yncas*, by Christoval de Molina; 2nd, *An Account of the Antiquities of Peru*, by Juan de Santa Cruz Pachacuti-yamqui Salcamayhua; 3rd, *A Narrative of the errors, false gods, and other superstitions and diabolical rites in which the Indians of the province of Huarochiri lived in ancient times*, by Don Francisco de Avila; 4th, *Report by Polo de Ondegardo*. These four papers were among the narratives and reports furnished to Herrera for his history of the West Indies, of which he made such unintelligent use. They were found in the National Library at Madrid (B. 135) by Don Pascual de Gayangos, but not published in the original. We have to thank Mr. Markham for translating them, and the Hakluyt Society for selecting them to form a volume of their series.

It is difficult to say which of the four is the newest and most interesting. Mr. Markham seems to think the first by Don Christoval de Molina. Molina had peculiar opportu-

nities for collecting peculiar information. He had mastered the Quichua language, and being priest of the hospital for natives at Cuzco was intimately acquainted with the Peruvian character. He wrote between 1570 and 1580, while Dr. Don Sebastian de Artaun was bishop of Cuzco, at a time when many among the natives could remember the days of independence. I think, however, that the narrative of Salcamayhua, although less accurate than Molina's report, is of the greatest moment. It is the only account written by a native of Peru which we possess up to this time, and, by giving us a sample of the rude materials with which the Spanish or metis writers had to deal, shows us the difficulties with which they had to contend while composing their histories.

Salcamayhua, who wrote about 1610 or 1620, was the descendant of a great Indian family the chiefs of which were the first who came to the tambo of Caxamarca to be made Christians, "renouncing all the errors, rites, and ceremonies of the time of heathenry, which were devised by the ancient enemies of the human race, namely the demons and devils." He begins with a profession of Catholic faith, and then proceeds to affirm that he heard "from a child, the most ancient traditions and histories, the fables and barbarisms of the heathen times, which are as follows; according to the constant testimony of the natives touching the events of past times."

In the beginning there was all over Peru a *Purun-pacha*, "a time of wildness," when all the nations of the four provinces came from beyond Potosi in four or five armies arrayed for war, and settled in the different districts as they advanced. This period was called *Ccallac-pacha*, time of the beginning, or *Tutayac-pacha*, time of night, and lasted for a vast number of years. When the country was peopled, there was a great want of space, and, as the land was insufficient, then wars broke out and there was no rest from them, inasmuch that the people never enjoyed any peace. It was even the time when the *Hapi-nuñus*, the devils, walked visibly all over the land, and it was unsafe to go out at night, for they violently carried off men, women, and children. But "then, in the middle of the night, they heard the *Hapi-nuñus* disappearing with mournful complaints, and crying out, 'We are conquered! alas, that we should lose our bands!' By this must it be understood that the devils were conquered by Jesus Christ our Lord on the Cross on Mount Calvary."

Some years afterwards, there arrived in the four provinces, "a bearded man, of middle height, with long hair, and in a rather long shirt. They say that he was somewhat past his prime, for he had already grey hairs, and he was lean. He travelled with his staff, teaching the natives with much love, and calling them all his sons and daughters. As he went through all the land he performed many miracles: the sick were healed by his touch; he spoke all languages better than the natives. . . . He was called *Tonapa Uiracocha nipacachun*; but was he not the glorious apostle St. Thomas?" Once he came very tired to the village of a chief called *Apo-tampu*, who listened to him with friendly feelings and to whom it is said that he gave a stick from his own staff, "and through this *Apo-tampu*, the people listened with attention to the words of the stranger, receiving the stick from his hands. Thus they received what he preached in a stick, marking and scoring on it each chapter of his precepts. The old men of the days of my father, Don Diego Felipe, used to say that *Caçi-caçi* were the commandments of God and especially the seven precepts; so that they only wanted the names of our Lord God and of his son Jesus Christ our Lord; and the punishments for those who broke the commandments were severe." After preaching through the various provinces, breaking idols, and turning into stone

whoever refused to listen to him, "*Tonapa* then followed the course of the river *Chacamarca*, until he came to the sea. This is reported by those most ancient Yncas."

*Apu-tampu*, *Tonapa's* friend, had a son named *Manco-Ccapac-Ynca*, or *Apu Manco-Ccapac*, who, after the death of his father and his mother, "assembled his people to see what power he had to prosecute the new conquests which he meditated." After some adventures he founded Cuzco and married one of his own sisters named *Mama-Ocillo*, "and this marriage was celebrated that they might have no equal, and that they might not lose the caste. Then they began to enact good laws for the government of their people, conquering many provinces and nations of those that were disobedient. The people of the four provinces came with a good grace and with rich presents. The tidings of a NEW YNCA had spread widely. Some were joyful, others were afflicted." From *Manco-Ccapac-Ynca* is descended the powerful dynasty of the Yncas, whose genealogy, as given by *Salcamayhua*, is as follows:—

- Apu-Tampu*,  
friend of *Tonapa*, about A.D. 50-100
- I. MANCO-CCAPAC YNCA ab. A.D. 100
  - II. SINCHI-RUCA YNCA
  - III. YNCA LLOQUE-YUPANQUI
  - IV. YNCA MAYTA CCAPAC
  - V. YNCA CCAPAC YUPANQUI
  - VI. YNCA RUCA
  - VII. YAHUAR-HUACCAC YNCA YUPANQUI
  - VIII. UIRA-CCOCHA YNCA YUPANQUI
  - IX. PACHACUTI YNCA YUPANQUI
  - X. TUPAC-YNCA-YUPANQUI
  - XI. HUAYNA-CCAPAC-YNCA.

XII. HUASCAR YNCA, XIII. ATAHUALPA (1533), XIV. MANCO YNCA.

It is almost the same genealogy as that given by *Garcilasso*, but the difficulty is how to reconcile the quasi-contemporaneity of the new Ynca *Manco-Capac* with *Tonapa-St. Thomas*, and the date of the Conquest by the Spanish. It is impossible that only twelve generations should have reigned during more than fourteen centuries: but poor *Salcamayhua* did not trouble himself much with chronology. He contented himself with collecting as many traditional stories as he could, and succeeded in giving an account of the last dynasty that ever reigned over Peru before the Spanish conquest. That he knew nothing of the kings who lived in the *Purun-pacha*, the time of wildness, is self-evident; but from one word which escaped him, we may gather that even amongst the Indians of his neighbourhood, the memories of the primitive dynasties were not entirely lost. Speaking of *Manco-Ccapac's* accession, *Salcamayhua* or his informers narrate that "the tidings of a NEW YNCA had spread widely," thus showing unconsciously that they had a vague acquaintance with the OLD YNCAS whose names and legends *Montesinos* succeeded in collecting afterwards.

It is hardly necessary to say that the whole publication has been executed with Mr. Markham's usual accuracy. The map, plate, and index have been made *con amore*; Mr. Markham has even compiled a Dictionary of most of the Quichua words cited in the book. I wish only he had given a literal translation of the Quichua texts that occur so

frequently in *Molina's* and *Salcamayhua's* pages: they contain so many corrupt forms of spelling and so many unknown words that it is often impossible to make out their exact meaning. I know that Mr. Markham, who succeeded so well in translating the difficult *Ollanta*, would have equally well succeeded in correcting and interpreting those texts, and that is the reason why I so much regret that he did not undertake the task.

G. MASPERO.

*La Conquête de Constantinople.* Par Geoffroi de Ville-Hardouin, avec la continuation de Henri de Valenciennes. Texte original, accompagné d'une traduction, par M. Natalis de Wailly. Paris: Didot. 1872.

ALMOST a century before Joinville, and perhaps similarly urged on by his comrades to tell the tale of the great deeds they had done together, Villehardouin wrote, without having any model to imitate, and in the somewhat rude dialect of the period, an account of the conquest of Constantinople by the French and Venetians. His work is our oldest historical book in French prose, which with some slight help is still easy to understand. It was read and admired at once, and Joinville (whose nearest relations were among Villehardouin's companions, though the editor seems to be incorrect in mentioning his father) may have been partly incited by it to write his *History of St. Louis*; which however had a very different date, as the MSS. lay long neglected.

M. de Wailly, who had already given us a valuable edition of Joinville, has now completed his labour of love by editing Villehardouin. We do not see that he has anywhere compared the language of the two, or shown whether there are traces of Joinville being influenced by the style of his predecessor. He has given however a valuable glossary of the early French words. In the MSS. of Joinville we can trace the dying out of the old terminations, for whereas in the best MS. the *s* of the nominative is still preserved, in the next MS., less than half a century later, this (together with the distinction of form between the nominative and objective cases) has perished. In Villehardouin of course the ancient terminations are fully preserved. Thus *sires* is the nominative, *sire* the vocative, *seignor* the objective case; while *seignor* is the plural nominative and vocative, and *seignors* the form when governed by another noun. The vocabulary contains some words which have survived in English better than in French, e.g. host, barge, bacon, plea, mile, mischief. Gibbon, who in his sixtieth chapter has made the most admirable use of our author, several times remarks on his language; thus he speaks of "the original and expressive denomination of *vessiers*, or *hussiers*, from the *huis* or door, which was let down as a drawbridge; but which, at sea, was closed into the side of the ship." Perhaps the editor has hardly given enough of this kind of explanation, but has limited himself too strictly to printing a list of the old forms. His first object was of course to ascertain which was the most authentic manuscript; as Dom Brial in 1822, Paulin Paris in 1838, and Buchon in 1840 had each preferred different MSS., so different that we may be said to have three Villehardouins instead of one. The editor has followed Dom Brial (as he followed Ducange's choice in 1657) in selecting MS. 4972 in the *Bibliothèque Nationale* as the best. This MS. was written, perhaps at Venice, by an Italian copyist in the time of Philip of Valois. Venice, where the MS. long remained, and where the first edition was published in 1573, may almost claim an equal share in our historian, as he seems often to give the views of the famous Doge Henri Dandolo, the real chief of the expedition. A MS. very similar to the Venetian is at Oxford. The Italian copyist did his work honestly, but he omitted some things and rather disfigured the names,

and hence other copies must be referred to for help. 'B' is a MS. of similar age, probably copied in the Isle of France, or rather rewritten, the alterations of phrase and adaptation to the language of the fourteenth century showing the continued popularity of the narrative. Buchon again has printed from MSS. which are written in a Picard or Flemish dialect of French, instead of in Villehardouin's own dialect of Champagne. Paulin Paris prefers an inferior MS., which however, having been probably copied in the Isle of France, comes nearer to the author's own dialect than the Picard MSS. On the other hand the editor has followed a Picard copy for Henri de Valenciennes, the continuator of Villehardouin, though he has made the text more uniform by help of a collection of original charters belonging to Aire in Artois, as Valenciennes is in the same province. He had made a similar use of charters in his edition of Joinville. We may give a short specimen of each.

Villehardouin, § 171: "Li murs fu mult garniz d'Englois et de Danois, et li assaiz forz et bons et durs. Et par vive force monterent des chevaliers sor les eschieles, et dui serjant, et conquistrent le mur sor als; et monterent sor le mur bien quinze, et se combatoient main à main as haches et as espées."

H. de Valenciennes, § 509: "Quant li empereres vit ke Lyenars ne pooit escaper sans mort u sans prison, il monta sor un sien cheval Moriel, et le hurta des esperons, et s'adrecha vers un Blac. Et quant vint à l'aprocier, il le feri parmi le costé de la lanche, si ke li fiers en parut d'autre part; et chil ki le cop ne pot soster, cal à terre comme chil ki ne pot mais. Moriaus fu navrés en deus lius."

Little is known of Villehardouin himself. The small village which gave him its name is near Troyes, the capital of Champagne, and he was Mareschal of that province, the court of which was one of the most polished in Europe. In fact all the early French historians came from this north-eastern part of France, where the French and German races mingle. From the arms of his nephew, the Prince of Achaia, as compared with those of the historian (p. iii), it is clear that Villehardouin was younger than his brother, the prince's father, and on the whole his birth may be dated not long after 1150. He was of an age and experience well fitted to obtain the confidence of his comrades when he took the cross in 1199, and he seems to have acted throughout in complete accordance with the Doge; they saved the army when the Emperor Baldwin madly threw away his life in the war against Calo-Johannes the Bulgarian king. Villehardouin was a good negotiator, and often took the lead in the business of the Crusade, which required much management, as it was difficult to keep the adventurers together in any way. He is silent about Innocent III.'s strong disapproval of the buccaneering attack on Constantinople, and merely says of the elder Simon de Montfort, who turned back from it, that he "ot fait son plait al roi de Ungrie, qui anemis estoit à cels de l'ost; et il s'en ala à lui et guerpi l'ost." It is true that Gregory VII. had long ago thought (and Alexius Comnenus had good reason for suspecting such a design) that a firm footing in Constantinople was almost indispensable before the Holy Land could be recovered, that country being untenable in a military sense, except by a power which holds either Egypt or the lands to the north-east of Palestine. And so it is argued here, § 96, "Et sachez que par la terre de Babiloine (*i.e.* Egypt) ou par Grece iert recovrée la Terre d'oltre-mer (*i.e.* Palestine), s'ele jamais iert recovrée." (Compare too §§ 30 and 198.) But in fact the adventurers, like the Normans before them, were looking to get lands for themselves in the Holy War, and a very slight pretence drew them off to attack the rich capital of the East. They went at the invitation of an exiled prince, just as Amadis of Gaul, or any of the old heroes of romance, might have gone, and utterly disregarded the injunctions of the Holy See. It is only from the Pope's letters too that we

know of the atrocities they committed—Villehardouin says nothing about them. He reserves his laments for the French nobles who fall in the field. What Scott makes Claverhouse say of Froissart is equally true of the "Mareschal of Champagne and of Romania":—"With what true chivalrous feeling he confines his beautiful expressions of sorrow to the death of the gallant and highbred knight, of whom it was a pity to see the fall, such was his loyalty to his king, pure faith to his religion, hardihood towards his enemy, and fidelity to his lady-love. But truly for sweeping from the face of the earth some few hundreds of villain churls, who are born but to plough it, the highborn and inquisitive historian has marvellous little sympathy." He just mentions the common soldiers once, § 394, "les povres et les menus qui ne valaient gaires, fist mener en Hungrie; et les autres qui auques valaient, fist les testes colper." Of the ruin brought on Constantinople by the three dreadful fires kindled by the Franks he merely says, § 247, "et plus ot arses maisons qu'il n'ait es trois plus granz citez del roialme de France." And yet the results of the expedition, as told by himself, are enough to show the political folly of an enterprise which ruined the Empire that was the only bulwark against the Turks. The Latins could so little replace the Greek government that they were no match for even the neighbouring Bulgarians, and the last events that Villehardouin relates are the deaths of Baldwin of Flanders and Boniface of Montferrat, the leaders of the Latin Crusade, in battle against "Johannis le rois de Blaquie et de Bougrie." Perhaps the views of the common soldiery may be better represented by Robert de Clari (in the Amiens district), whose description has been lately prepared for publication by Count Riant. Henri of Valenciennes narrates the exploits of the Emperor Henry, who succeeded his brother Baldwin, but the Picard writer inserts speeches and romantic narratives in a way which led Paulin Paris to suspect that the account was written originally in verse. The good war-steeds Bayart and Moriaus (Moreau) have their full need of praise in this part of the history. In both authors the editor has kept to the old forms of the names of places and has taken considerable pains to identify them; and a map by Auguste Longnon has been added—considerable help of course being derived from Buchon, *Recherches et matériaux pour servir à une histoire de la domination Française en Orient*. Good illustrations have been derived from contemporary MSS. in the possession of the eminent publisher Ambroise Firmin Didot.

Villehardouin received from the Emperor Henri the city of Messinople (Mosynopolis, see p. xxiii), in Thrace, and he died there about 1213. His heirs ruled important principalities in Greece for nearly two centuries, and we should have been glad if the editor had given us a pedigree of the family. But the attempt to plant French kingdoms in the East and make the Mediterranean as it were a French lake failed; and perhaps the most enduring result of the Latin conquest lies in the romances from which "Duke" Theseus passed into Chaucer's "Knight's Tale," and Shakspeare's *Midsummer Night's Dream*; and in these Chronicles of the Crusades by Villehardouin and Joinville, which have been the delight of many successive generations. Villehardouin has no central figure, round which all else is grouped, like the Saint Louis of Joinville; but the greatness of the tragic event which he describes needs no such interest to heighten its effect—the ruin of the last home of the ancient literature and civilisation, "Graecia Barbariae lento collisa duello." The modern names contrast with the ancient in almost every page. It sounds strange to hear the Black Sea called "la mer de Rossie," though we know that the Russians had

repeatedly attacked Constantinople. Of our own countrymen in the famous Varangian Guard, 'the English armed with battle-axes,' we hear that they repelled the first Venetian attack, but the cowardice of the Emperor made their efforts of no avail. To make his work as complete as possible the editor has added an extract from the compilation of Baudouin d'Avesnes, which may possibly give us a lost part of Henri de Valenciennes, describing the death of the Emperor Henri and the subsequent events. We cannot but give the highest praise for these excellent editions to M. de Wailly, who has been worthily supported by M. Didot.

C. W. BOASE.

### Contents of the Journals.

Von Raumer's *historisches Taschenbuch*, herausgegeben von H. Riehl, 1873, contains six essays. The first gives Mack's defence of the Capitulation of Ulm on his trial for high treason, of much interest just now when a similar trial is going on as to the surrender of Metz.—Weber analyses Rabelais' great work as illustrating the period of transition between two Ages.—Dahn's account of the growth of the kingly power in the early German States may be compared with Freeman's in the first volume of the *Norman Conquest*.—Henke (the church historian, who has just died) contributes a biography of Théodore Agrippa d'Aubigné, the firm friend of Henri IV., who was yet opposed to so much of the great king's policy.—Liliencron's essay on the Emperor Maximilian's *Der Weisskunig* ("The White King," not "the wise") is especially good. Maximilian first wrote his allegorical poem *Der Theuerdank*, in which the hero goes through many adventures in his journey to woo Lady Honour (in whom Mary of Burgundy is to a certain extent personified), and then meant to describe in prose, in "The White King," his own actual campaigns (each king being described by the colour of arms, &c., the English being called "the red-white king" clearly gives the union of the red and white rose), to conclude as he hoped with a crusade against the Turks, but this never came to pass, and the prose work has no conclusion.—Lastly Uhde gives some amusing selections from the autobiography of Caroline Schulze, an actress of the last century, whose rivalry with another actress at Hamburg led to the events which occasioned Lessing to write the *Dramaturgie*, and who at Leipzig charmed Goethe in his schoolboy days. This year's volume is particularly interesting.

Von Sybel's *historische Zeitschrift*, drittes Heft, 1873.—Waitz discusses the best mode of continuing the *Monumenta Germaniae Historica*.—Kaufmann criticises the extant accounts of Clovis' decisive victory at Vouglé (507).—Reimann reviews Sickel's excellent history of the Council of Trent, laying stress on the way in which the Catholic powers were finally induced to accept the continuance of the former Council instead of having a new Council summoned which the Protestants might attend.—Schmoller describes the administration of East Prussia under Frederic William I., who made the authority of the State once more supreme over the obstructive local privileges and privileged classes. English readers may compare his account with Carlyle's. Schmoller rightly points out the King's real services: his experiments in political economy were far from beneficial.—Lehmann analyses the French accounts of the Campaign of Sedan, proving that it was really Bazaine's despatch of Aug. 19, announcing his intention to break out of Metz, which induced MacMahon to give up his plan of retiring on Paris and undertake the disastrous march to Sedan.—Nissen reviews Freeman's second series of Historical Essays, especially criticising his account of Mommsen and other German historians. A number of the local histories and documentary collections relating to Mecklenberg, Saxony, Basle, Nuremberg, are briefly noticed, and an abstract given of vol. iii. of Amari's excellent *Storia dei Musulmani di Sicilia*.

*Literarisches Centralblatt*, July 26, reviews Suchier, *über die Quelle Ulrichs von dem Türlin* (already noticed in the *Academy*).—Aug. 2 reviews Waitz, *die Formeln der deutschen Königs- und der römischen Kaiser-Krönung*, and Ignazio Senti's excellent *Elementi di bibliografia* (Verona, 1872).—Aug. 9 praises Gaston Paris' defence of the genuineness of Gunther's Latin poem *Ligurinus*, but points out freely the defects of the *Monumenta historica Danica*.—Aug. 16 reviews in detail Schuster's valuable rearrangement of the Fragments of Heraclitus, and praises Otto Mejer's *zur Geschichte der römisch-deutschen Frage* for the information it contains as to the great question now pending between Church and State; Giesebrecht's *Arnold von Brescia* is noticed as proving that the *Historia Pontificalis* was written by John of Salisbury, who thus enables us to check the account given by Bishop Otto of Frisingen.—Aug. 23 criticises Beulé's account of the Emperor Tiberius.—Aug. 30 notices Maassen's *eine Rede des Papstes Hadrian II. (869)*, the first thoroughgoing attempt to base the Papal Supremacy on the Forged Decretals; and Eberhard's *Fabulae Romanenses Graece conscriptae*.—Sep. 6 gives an account of the new edition of Spruner's admirable

*Handatlas für die Geschichte des Mittelalters und der neueren Zeit*, and of Eitelberger v. Edelberg's *Quellenschriften für Kunstgeschichte und Kunsttechnik des Mittelalters und der Renaissance* iv.—Sept. 13 notices Susemihl's new edition of Aristotle's *Politics*, Wagner's edition of the Greek poem on Belisarius from the Vienna MS., and Redtenbacher's *Beiträge zur Kenntniss der Architektur des Mittelalters in Deutschland*.

## Philology.

**Comparative Grammar of the Modern Aryan Languages of India,** to wit, Hindi, Panjabi, Sindhi, Gujarati, Marathi, Oriya, and Bangali. By John Beames, Bengali Civil Service, Fellow of the University of Calcutta. Vol. I. On Sounds. London: Trübner & Co. (xvi. 360 pp. 8.)

THE present work of Mr. Beames fills up a considerable gap in our knowledge of the seven principal modern languages of India, particularly felt by every one who takes an interest in the old Prākritis. In a field like this, where little has been done and much remains to be done, it is but natural that there should be several weak points in Mr. Beames' *Grammar*; but nobody who has an idea of the many difficulties connected with these studies will blame him for this. Though Mr. Beames, in a note to p. 9, rightly remarks that the subject of Prākrit is quite secondary throughout the work, still the connection between ancient and modern Prākrit is after all far too close not to force us constantly to recur to the former. Mr. Beames has a fair knowledge of Vararuchi's *Grammar*, and is well versed in the works of Professors Höfer, Lassen, and Weber; but Pāli and the Prākritis of the plays, especially the lower dialects, he has hardly taken into consideration. This is a real defect in his work and the source of numerous errors. Thus on p. 22 he asserts that "in point of development we do not get lower down than about the first century of our era," and hence he maintains that the nine centuries till Chand Bardai will probably remain for ever a sealed book. I confess that his reasoning is utterly unintelligible to me. I cannot see why we should fix the first century in particular as a line of demarcation. If Mr. Beames, instead of constantly making his references to the *Hāla* and the *Bhagavatī*, had examined the various dialects of the Mṛchchhakatikā, the Apabhraṃṣa songs of the fourth act of the *Urvaśī*, and the Apabhraṃṣa of Pingala, the gap would not have seemed to him so very wide. These last two dialects have already lost much of their old synthetical construction, their flexion is in a state of complete decay, and in many respects they form the missing link between the Çaurasenī and the vernaculars. Mr. Beames strongly denies that the Prākrit of the *Hāla* was ever spoken or has given rise to any of the modern languages. I fully agree with him. Tradition nowhere says that *this* Mahārāshṭrī was ever a spoken language; on the contrary, wherever it is mentioned it is expressly stated to have been a poetical language only. The commentator of the Mṛchchhakatikā, p. v., ed. Stenzler, most decidedly says: "mahārāshṭryādayaḥ kāvya eva pravyujyante" (the Mahārāshṭrī and the others are used in poems only). In the plays the Mahārāshṭrī is restricted to the songs. It is due to an oversight that Mr. Beames, at p. 7, asserts that ladies of high rank speak Mahārāshṭrī. Their songs are composed in Mahārāshṭrī, but their speech is Çaurasenī. All the gāthās of the dramas are written in exactly the same Prākrit as the gāthās of the *Saptatī*, but as soon as persons begin to speak, the language used is Çaurasenī or any other dialect but Mahārāshṭrī. In the *Mudrārākshasa* (ed. Calc. 1871) Virādhagupta disguised as a snake-charmer introduces himself as a Prākrit poet; in the beginning of the second act, p. 57 sq., he speaks Çaurasenī, but the gāthā on the leaf he presents to Rākshasa is pure Mahārāshṭrī. The same is the case in all other dramas, and hereby it is proved that *this* Mahārāshṭrī certainly never was a spoken language. Indeed if we adopt the view that the Prākritis are as old as the Vedic language, and again admit that *this* Mahārāshṭrī represents one of the oldest forms of Aryan speech, we are driven to the conclusion that our Indian ancestors after doffing monkeyhood began to speak in verse. Next comes the question as to the Çaurasenī. Of this interesting dialect very erroneous opinions are afloat. Mr. Beames does not take any notice

of the twelfth section of Vararuchi, and by scenic Prākrit he means apparently the Mahārāshṭrī. Yet there is a great difference, and Vararuchi's sweeping rule (xii. 32), çeṣaṃ mahārāshṭrīvāt, is open to much controversy. The remarkable sūtra xii. 3, which corresponds to Hemachandra's sūtras iv. 260 and 267, is fully borne out by all critical editions based upon good MSS., and at once separates the Çaurasenī from the Mahārāshṭrī. The assertion at p. 201 that elision is the rule in Prākrit does not hold good for the lower dialects, which on the contrary show a strong tendency to retain some of the consonants; and since Çaurasenī, and not Mahārāshṭrī, is the principal dialect of the plays, statements such as those at pp. 196, 198, 205, 222, are perfectly erroneous. The Çaurasenī represents in many respects by far an older stage of development than the Mahārāshṭrī of the *Hāla*, which is artificially trimmed up by the poets with some archaic remnants and interwoven with some good old Aryan words to make it look a little more respectable, but on the whole is truly described by Mr. Beames (p. 223) as "emasculated stuff." The Çaurasenī was never a spoken language either; all we can say is that it was the prose of the poets. Mr. Muir is of opinion that the Prākritis such as we see them in the plays must have approached closely to some form of spoken language, "because they have been used on the stage and therefore must have been intelligible" (*Sanskrit Texts*, ii. 31, ann. 66). The argument is not conclusive. We should be obliged to suppose that even Sanskrit was still intelligible to the people, as there is generally more of Sanskrit than of Prākrit in the plays. Nor are we anywhere told that the plays which have come down to us were ever popular. The *Ratnāvalī* is stated to have been performed before an assembly of kings; in the *Mālatīmādhava* the manager addresses the "āryavidagdhamicṛā bhagavanto bhūmidevāḥ cha," and in many other dramas he addresses the "āryamicṛās." Hence it is clear that these plays were performed before a select auditory. Now Rāmatarakavāgiṇi in a well-known passage quoted again by Mr. Muir (*Sansk. T.*, ii. 46) styles Apabhraṃṣa all the provincial languages, which are not used in the dramas, such as Bangālī, Gujarātī, &c., and he remarks that the four vibhāshās, "though characterized by apabhraṃṣatā, are not to be ranked in the class of Apabhraṃṣas, if employed in the dramas." Daṇḍin (*Kāvyaḍarṣa*, i. 36) says: "çāstreshu saṃskṛitād anyad apabhraṃṣatayoditam"; "in grammars whatever differs from Sanskrit is called Apabhraṃṣa". Ravikara in his commentary on Pingala quotes the following verses (*Urvaśī*, ed. Bollensen, p. 509): "deçabhāshām tathā kechid apabhraṃṣaṃ vidur budhāḥ | saṃskṛite prākṛite vāpi rūpasūtrānurodhataḥ | apabhraṃṣaḥ sa vijñeyo bhāshāyām yatra laukikī" i.e. the learned know that Apabhraṃṣa is the language of the (different) countries; since there is in Sanskrit or Prākrit a regard for the rules on forms, it must be known that that is Apabhraṃṣa, where there is in the speech the ordinary (colloquial) form. And again Daṇḍin says (l. i. i., 35) "çaurasenī cha gaudī cha lāṭī chānyā cha tādṛiṣṭī | yāti prākṛitam ity evaṃ vyavahareshu sannidhiṃ." This is the true reading of the passage as given by Tarkavāgiṇi and means: "The Çaurasenī, the Gaudī, the Lāṭī, and such like dialects become similar (scil. to the Mahārāshṭrī, i. 34) in dialogues under the name of Prākrit."

Tarkavāgiṇi rightly explains "yāti" by "kavibhir niveçyate" (is made by the poets). From these passages, and numerous others which want of space forbids me to quote, it is clear that there was a popular speech which was not identical with either Sanskrit or Prākrit, that this popular speech was called Apabhraṃṣa, and that deçabhāshā and apabhraṃṣabhāshā are only two terms for the same language, that these Apabhraṃṣas were turned to account by the poets and then called Prākrit. What we are accustomed to call Prākritis are only poetical

fictions ; instead of speaking of modern Prākṛits, we ought to speak of modern Apabhraṃṣās ; for our vernaculars are the daughters of these old Apabhraṃṣās, and not of the so-called old Prākṛits. The Mahārāṣṭrī of the *Hāla* is the Mahārāṣṭra Prākṛit, i.e. the language of the Mahārāṣṭra poets ; but besides this there was a Mahārāṣṭra Apabhraṃṣa, i.e. the language of the Mahārāṣṭra people ; and this in its youngest shape is the modern Marathi. The Çauraseni of the plays is the language of the Çaurasena poets, the Çaurasena Prākṛit ; the language of the Çaurasena people was the Çaurasena Apabhraṃṣa, i.e. our Gujarātī. In the *Mahābhāṣya*, as quoted by Mr. Muir (l. c. p. 154) occurs the following passage: “ekaikasya hi çabdasya bahavo ‘pabhraṃṣāḥ | tad yathā ‘gaur’ ity asya çabdasya ‘gāvi’ ‘goṇī’ ‘gota’ ‘gopotalikā’ ity evam ādayo bahavo ‘pabhraṃṣāḥ.” Two of these words, gāvi and goṇī (or at least goṇo), are good Pāli words, cfr. Childers s. v. ; goṇa is found in the Mṛichchhakatikā, in the Māgadha Prākṛit, and *Trivikrama*, i. 3, 109 and ii. 1, 30, mentions both amongst other deççabdas. Pāli is the Māgadha Apabhraṃṣā ; the Māgadhi of the plays is the Māgadha Prākṛit. The three languages which the Rīgveda, i. 164, 45, declares to be “hidden in secret” are the Vedic language, Samskrit, and Prākṛit ; the fourth “uttered by men” is the Apabhraṃṣa. If this be true, it is clear that there must have been a closer connection between the ancient Apabhraṃṣās and the modern ones. The rules laid down by Kramadīçvara (Lassen : *Institutiones Prācriticae*, p. 449 sq.) are too corrupt to afford much aid in proving this ; but *Trivikrama*, the author of a most valuable Prākṛit grammar, treats of the Apabhraṃṣa in two pādās of considerable length. The MS. is written in the Grantha character, and belongs to the Burnell collection, No. 84. In iii. 3, 2 we find the following rule together with its commentary : || acho ‘stavo ‘khau kakhatathapaphā gaghadhababhān | apabhraṃṣa ity anuvartate | apabhraṃṣe acha pare astava asamyuktā akhau anādu vartamānāḥ ka kha ta tha pa pha ete varṇā ga gha da dha ba bha ity etān prāyo yathāsamkhyam āpadyante. | From this sūtra it follows that as a rule there is no elision in the Apabhraṃṣa ; the tenues are softened into the mediae, just as is the case in the vernaculars. It would be out of place here to go into further details. I hope I have shown that a study of the Apabhraṃṣa dialects would have furnished Mr. Beames with much more valuable material than the Prākṛit of the *Saptatārī* and even that of the *Bhagavatī*. Mr. Beames touches several times on the important question whether we have to write *v* or *b* in Prākṛit (pp. 199, 203, 251, 252, 325). This question is finally settled by the Draviḍian MSS., which have distinct signs for *v* and *b*. They always write *v* and never *b* in the place of a Sanskrit *p*. The *Trivikramavṛitti*, which, as I have mentioned above, is written in the Grantha character, has the rule po vaḥ corresponding to Vararuchi’s, ii. 15, and so has the Prākṛita-mañjarī a commentary on Vararuchi written in the Malayālam character. It must however be borne in mind that this holds good only for *v* when originated from *p* and for *b* in the middle of a word. In the beginning of a word *b* remains unaltered. *Trivikrama*, i. 3, 62, has a rule which corresponds to Hemachandra’s, as given by Mr. Cowell, Vararuchi p. xiv. : || bo vah || asamyuktasyānādu sthitasyaçāḥ parasya bakārasya vakāro bhavati | çabalaḥ savalo | alābuh alāvū alāū | Mr. Beames is therefore right in every respect. The Apabhraṃṣa again stands out in strong relief, being the only dialect which changes *p* into *b*. The latter change apparently is the older, *v* being a softening of *b*. Mr. Beames is not very much inclined to admit of a strong Draviḍian influence on the vernaculars. I am afraid that he goes much too far in this respect. A study of the Prākṛit works written in Draviḍian characters proves that the Draviḍians have introduced their

peculiar pronunciation even into the literary Prākṛit. Connected with this aversion to Draviḍian influence is Mr. Beames’ opinion on the cerebrals, which he considers more original than the dentals (pp. 219-247). The simple fact that the older an Apabhraṃṣa or Prākṛit dialect is the less frequently it employs cerebrals, seems to me to be against this theory. For the same reason I cannot adopt the view that the change of a Sanskrit *ksha* into a Prākṛit *cha* is older than that into a *kkha* (pp. 309-313). In many cases *ksha* has been changed into *cha* by the influence of a following *ya*. On the other hand Mr. Beames is certainly right in his opinion on *kkh* (pp. 305, 306). We hope that Mr. Beames may find sufficient time to complete his work. Such as it is now, it is already a most valuable and important book, and a new proof of its author’s indefatigable zeal, sound judgment, and good knowledge of the vernaculars. R. FISCHER.

Vie et Sentences de Secundus, d’après divers manuscrits orientaux les analogies de ce livre avec les ouvrages Gnostiques. Par M. E. Revillout. Paris : Imprimerie Nationale.

THE Greek text containing the story of Secundus, the “silent philosopher,” and the replies which he made in writing to the Emperor Adrian is most accessible to classical scholars in the collections of Orelli and Mullach. Orelli speaks of it as “opusculum inepti hominis et plane barbari,” and critical historians of philosophy look upon it as wholly worthless for their purposes. That the story, however, has enjoyed an extensive popularity is quite certain. There are several Latin versions or abridgments of it. It was well known in the Middle Ages through a translation incorporated into the *Speculum Historicum* of Vincent of Beauvais, and it is also found inserted in the chronicles of Roger of Hoveden. Some fragments of a Syriac text have been published in Sachau’s *Inedita Syriaca*, and M. Revillout speaks of at least four Aethiopic and six Arabic texts ; all of which he intends to publish. There is a considerable difference between the eastern and western versions of the story, and M. Revillout’s essay is intended to point out the relations which they bear to each other. He considers the Greek as a mere “abrégé informe fait par un traducteur maladroit et lubrique,” the original of it being an eastern and Semitic text, of which the Arabic is in general a more faithful representative than the Syriac. The Latin texts are derived from the Greek, but contain some passages to which the eastern recensions bear witness but which the Greek has omitted. The Aethiopic version closely follows the Arabic. None of the existing texts however can establish its claim to be the original ; the combined evidence, according to M. Revillout, rather pointing to a primitive text now lost, and containing a philosophical and religious doctrine closely allied to Gnosticism. M. Revillout calls his essay a “première étude sur le mouvement des esprits dans les premiers siècles de notre ère.”

Until we can actually compare the eastern texts of which M. Revillout promises the publication, it would be imprudent to pass a definite judgment on the entire question which he has raised. Meanwhile, with all due deference to the extensive and genuine erudition which these pages display, I cannot but venture to dissent from some of M. Revillout’s assertions, arguments, and conclusions. Far from expecting to gain any illustration of the religious or philosophical ideas current in the first ages of Christianity, I am utterly at a loss for evidence as to the antiquity of the story of Secundus. The earliest document connected with it is the Syrian MS. containing the fragments published by Dr. Sachau, and that is of the ninth century. The Arabic text (whatever be the date of its original) can surely lay no

claim to antiquity, and it is from it, according to M. Revillout, that the Aethiopic text is derived. The Greek text, as he shows, bears distinct evidence of belonging to the times of the "Bas Empire." Nor can I discover the least dogmatical evidence of such an antiquity as he claims for it. The so-called philosophical ideas which M. Revillout thinks ancient are not peculiar to the earlier ages of Christianity, but are found in the writings of sophists and rhetoricians of a much more recent period. And if, as he justly says when speaking of the Greek text, "le reste du livre est pour ainsi dire daté par l'emploi du mot *metaton*," the Arabic version of the story contains distinct evidence which is not less fatal to its pretensions.

This evidence is to be found in the apologue with which Secundus excused his mother to the emperor Adrian. M. Revillout considers this as an essential and inseparable part of the story, and even finds traces of it in the Greek text, though by its omission "l'abbreviateur grec a fait preuve ici comme partout d'une ineptie rare." Of the apologue itself he says "Combien tout ceci est oriental ! comme on se sent bien dans un milieu vraiment sémitique !" Oriental it certainly is, but with the exception of a slight biblical colouring which has been interpolated, it is quite as certainly not Semitic. It is simply borrowed from one of the tales of the *Book of Sindbad*, a work which, like *Kalilah and Dimnah*, most probably passed, from the Sanskrit through Pehlevi into Syriac and Arabic, and became known to the western world at the time of the Crusades. We have it in the Hebrew *Mishle Sendabar*, in the Greek collection bearing the name of Syntipas, and in the *Tales of the Seven Vizirs* often incorporated with the Arabic collection of the *Thousand and One Nights*. M. Revillout has in fact been looking out in a wrong direction, instead of following out the hint conveyed in the little note communicated by M. Defrémery—"Un récit analogue se rencontre dans le roman grec de Syntipas." The "récit" is not merely analogous, it is, *mutatis mutandis*, simply identical. And not only has it been borrowed as completely as any story has ever been borrowed from one novelist by another ; it is intended to supply very much the same place in the latter narrative that it filled in the more ancient one. Secundus breaks his long silence, at least in writing, with this apologue for the purpose of removing the blame from his mother and imputing it to destiny, just as the young prince in the Indian tale breaks his silence with the same apologue, the moral of which he applies to his own case. The biblical quotation is a mere adaptation employed by the Jewish or Christian plagiarist, just as in another tale of Syntipas the young prince invokes Christ, whilst the Arabic version makes him invoke Mohammed. Now the eastern text from which the Greek Syntipas is derived was certainly not known in western Asia any more than in Europe till a date quite as recent as the unfortunate word *μετάτον*, which M. Revillout considers conclusive against the antiquity of the Greek text.

The "unité frappante de contexture et de doctrines dans l'ouvrage entier"—"un roman lancé d'un seul jet, où une partie en appelle une autre, où les détails biographiques conduisent à des théories quintessenciées"—is then a mere illusion, except indeed as far as materials of different nature and origin have been more or less adroitly pieced together. All the different parts of the story may, like the "épisode inséparable" just referred to, have been derived from Indian sources, or details of western origin may have been combined with eastern fictions. Arguments are easily found in favour of either hypothesis, but they preponderate, I believe, in favour of the latter. M. Revillout has not made out his case that the Greek recension "est certainement le reflet d'un texte écrit dans une langue orientale." I cannot admit,

for instance, that *ἱερατικὴ βιβλιοθήκη* is evidence of translation from the Arabic. The Arabic is just as likely to be translated from the Greek, either directly or through the Syriac. Nor can I, without forgetting Lucian and Apuleius, not to mention other authorities, see why the scene between Secundus and his mother is only conceivable "dans un intérieur oriental." Secundus may have brought letters of recommendation, just as Lucius did to his Thessalian host. M. Revillout is, in fact, very unfair to the Greek recension. He talks of "peintures lubriques et détails obscènes." This is surely mere exaggeration. One of the expressions which shock him greatly is *τοῖς ὀφθαλμοῖς περιάμπων*. But the passage is manifestly corrupt, and certainly not to be understood as M. Revillout understands it. The narrator has no intention of representing Secundus as animated with impure ideas. The Latin text in one of the manuscripts (*Cod. Burn.* 360) of the British Museum reads—"Ille velut propriam matrem amplexus et osculis placans." *Osculis* is no doubt a mistake for *oculis*, but *placans* implies a Greek original different from *περιάμπων*.

The philosophical rubbish attributed to Secundus in the western recension is quite worthy of the sophists of the lower empire. It has been improved upon in the Arabic recension, and spun out to suit the taste of those, for instance, who read Hermes Trismegistus in Arabic or the *Mystical Philosophy* attributed to Aristotle but derived in fact from Alexandrian sources. That many points of analogy may be discovered between these philosophies and the various forms of Gnosticism is natural enough, the later Greek philosophy being the source both of Gnosticism and of Arabic speculation, as it also was of Sufism. But a work in which the theory of fatalism or providence is directly derived from an Indian book is eminently unfitted to illustrate the Gnosticism of church history. Gnosticism is a plant of western growth. During the first ages of Christianity no interchange of ideas between the philosophies of Europe and India is historically demonstrable or even probable. The hypothesis of an eastern origin for the philosophies of Philo and Plotinus or for such phenomena as Essenism has long been exploded. That Buddhism had anything to do with the rise or progress of Gnosticism or Manicheism is equally untenable.\* This hypothesis was only possible at a time when very inaccurate ideas prevailed as to the nature of Buddhism. The more or less apparent coincidences between eastern and western thought are absolutely independent of each other. But in the middle of the sixth century after Christ the great Khosru is said to have encouraged the translation into Persian of the most important productions both of Sanskrit and of Greek literature. From this time Indian fables and other tales gradually made their way into western countries ; the religious or philosophical ideas which they expressed being more or less modified by Jewish, Christian, or Mohammedan translators and imitators.

It is only then from a literary or from a philological point of view that the story of Secundus, as represented by the Arabic and Aethiopic versions, can have any interest for us. It is utterly untrustworthy as a guide to the course of thought in the early ages of Christianity, and it is also quite undeserving of that expenditure of erudition which M. Revillout has lavished upon it by way of illustration. But the erudition is valuable for its own sake, and although I do not admit M. Revillout's theory of Gnosticism I have no hesitation in

\* I have endeavoured to show this in detail, in an article on "Orientalism and Ancient Christianity" in the *Home and Foreign Review* of 1863, which also contains remarks on the origin of Kabbalism at variance with the views of M. Franck, M. Revillout's principal authority on the subject.

expressing the interest and admiration which the perusal of his essay has awakened in me. All Coptic scholars will carefully take note of his remarks on the grammatical blunders in the translation of the *Pistis Sophia*, and will, I am sure, agree with me in rejoicing at the prospect of a careful edition of the three Coptic treatises (p. 70) still remaining in manuscript at Oxford.

P. LE PAGE RENOUF.

### Notes and Intelligence.

The extensive library of the late Sir John Bowring is to be sold by auction. A very important Chinese work, however, has been presented to the Royal Asiatic Society, in accordance with Sir John's wishes, viz. the great standard Chinese dictionary, entitled *Tsse-iten*, compiled, by order of the Emperor Kang-he, by some thirty Chinese savans. The work consists of about 120 volumes.

Basque scholars will be interested to learn that the Basque-French Dictionary of M. van Eijs will soon make its appearance. For the first time they will have a trustworthy and scientific lexicon of the language in their hands. M. van Eijs has attempted to do for Basque what Fick has done for Aryan by the application of the comparative method, and has thus been able to recover many old roots and to explain many obscure forms. The work will be accompanied by a valuable introduction.

Among the other treasures brought back from Assyria by Mr. George Smith is a small fragment which fits on to the *fasti* tablet published in *W. A. I.* ii. 52, 1. It definitely settles the disputed question as to the reign of a Shalmaneser between Tiglath-Pileser and Sargon. Tiglath-Pileser, we find, in his last year "took the hands of Bel" a second time. Then comes the dividing line and the statement of Shalmaneser's accession to the throne. According to the next line, the king remained at home during the eponymy of the Prefect of Amida, but the three following years were occupied in campaigns against a country or countries the names of which are unfortunately lost. After this we have the dividing line again and a notice of Sargon's accession.

Dr. Adler, the Chief Rabbi, has in the press a commentary on the Targum of Onkelos.

Mr. Smith will read a paper at the first meeting of the Society of Biblical Archaeology on the new materials he has discovered for reconstructing the history of Babylonia and Assyria. A fragment of a list of the Babylonian dynasties is especially interesting, as it shows that Berosus had native data upon which to base his chronology.

*Searching the Net.* A Book of Verses. By J. L. Warren. Strahan and Co.

MR. WARREN has given a decisive proof of the depth and reality of his poetic vocation by a sustained and laborious progress from *Philoctetes* to the present volume. We cannot doubt that an impulse which leads an able man to bestow much well directed labour on its gratification is a sufficient justification for itself; perhaps poetry at bottom really requires only two things—an exaltation of feeling sufficiently intense and permanent to call imperiously for literary expression, and an adequate degree of intellectual accomplishment and of imaginative power to make the expression worth communicating and preserving. If these two elements are enough to make a poet, Mr. Warren possesses them in a very high degree: in fact if poets were to be ranked exclusively by the degree in which they possessed these two attributes he would be entitled to rank among the greatest living poets. There is, however, a third attribute which has always been prominent in really distinguished poets, which Mr. Warren seems hardly to have appropriated in the same measure as he has appropriated the two first. That it has escaped, or all but escaped, the researches of such an intelligent and conscientious artist is enough to prove that it is more impalpable than the others; perhaps it may be called imaginative spontaneity. To explain: the exalted feeling which is the fundamental condition of poetic inspiration may be associated either with an ordinary apprehension of ordinary things, not transformed essentially by the imagination, or with an original and unique apprehension of what the imagination has either created or transformed: in the first case the theme of the poem can always be adequately stated in plain prose, however richly the exposition may have been ornamented, or however appropriate the ornaments may be, however vital may be their connection with the mood from which the poem springs; in the second case, though the poem may be simple to the verge of childishness, as some of Blake's are, it is no more possible to describe its motive adequately in prose than to describe the motive of the simplest melody in language.

Perhaps it is just because Mr. Warren's feeling is so strong

and his imagination so copious that he has been content too often to take the theme which was to interpret the one and be adorned by the other ready made from the ordinary furniture of his intellect, instead of caressing his imagination till it transformed an old theme or supplied a new. And this want of purely imaginative spontaneity naturally leads to a want of artistic independence and artistic unity. One cannot say that Mr. Warren is an imitator of Mr. Browning or of Mr. Swinburne, but one cannot say that he is independent of them: the impulse under which he writes is genuine and unborrowed, but for want of a personal ideal to give direction to this impulse the manner in which he writes is too much at the mercy of the reading that he finds congenial. Again, one cannot say that there is an absolute want of arrangement in Mr. Warren's poems, but one cannot say either that they are always in a high degree organic; the admirable paragraphs and stanzas succeed each other always without confusion, but sometimes without cohesion, and when the author thinks he has written long enough he leaves off—in a good place.

The first poem in the present volume, "The Defeat of Glory," might serve alone to illustrate nearly all that has been said. Its 332 lines add literally nothing to the old quatrains at Melrose:—

"Earth goeth on the earth  
Glistening with gold;  
Earth goeth to the earth  
Sooner than it wold.  
Earth buildeth on the earth  
Palaces and towers;  
Earth sayeth to the earth,  
All shall be ours."

We might have doubted whether this was worth saying twice, we might have doubted whether it was worth saying at length; but there can be no doubt about the opulent inventive ingenuity with which the writer inflicts this thought upon us in detail through a series of stanzas whose ringing emphasis perhaps owes something to Mr. Swinburne. But after all one feels that, though many of the stanzas are worth having, the self-glorification of the king and the retort of the poet might have come at any point, and the poem would have been only shorter not less complete.

This last criticism does not apply to "A Middle Class Tragedy," where certainly no stanza is superfluous, though

the last reveals more than half the story :

"So, the tale runs, he has ruined my life,  
For a week's pastime, it's clear :  
He a great nobleman, covets my wife,  
Clerk on a hundred a year."

And yet one feels that there is something dry and barren in the exposition of the story of the poor clerk who only saves his stray ewe-lamb to lose her so ; the story is not made to grow and move as it would have been in the hands of Mr. Browning. Somewhat the same remark suggests itself with reference to two poems which, if my memory serves me, have appeared before as choruses in *Orestes*. When one compares the "Ode to the Sun" with Shelley's "Cloud" or invocation to "Night" one thinks that, with more imaginative spontaneity, the poem would have had more sweetness and musical flow ; when one compares "Nemesis" to a chorus of *Atalanta in Calydon* one misses the gathering rush, the rhythmical logic of imaginative passion. Such a comparison can hardly be called invidious ; it implies that Mr. Warren has enough cleverness and cultivation to deserve to be named with Shelley, or at any rate with Mr. Swinburne, if only he can comprehend in time that the imagination ought to be capable of higher functions than that of manufacturing images. Perhaps the best specimen in the volume of what is possible to an author with no other resources than strong feeling endeavouring to become articulate by dint of iteration and emphasis is to be found in the long ballad entitled "Two Old Kings," a sketch after Kaulbach. One leaves off with a feeling of sympathy as well as respect—though Uhland would have moved us more with a quarter of the detail, because Uhland's sentiment, thin as it is, is still spontaneous.

Though Mr. Warren has written two dramatic poems which in many respects are admirable, he has not yet mastered all the conditions of dramatic poetry ; in "Medea," for instance, the relative situation of the speakers has been well conceived at starting, and is eloquently and impressively discussed, but it does not advance or change by means of the discussion, and therefore the fragment is not quite dramatic.

The want of movement is of course less objectionable in analytical poems like "At the Council" and "The Cardinal's Lament," though here too we are conscious of a certain sterility underlying really copious and eager eloquence. In the first the writer tries to enter into the mind of the assembled Fathers of the Vatican, and he can find nothing for them to think but a paraphrase of what the Ultramontane newspapers said at the time. The second, in execution if not in conception, is of a higher character : the writer had materials for an article in the best manner of the *Daily Telegraph* on the dignity and pathos of the helpless, inflexible, indomitable protest of Ultramontanism against modern progress ; but being by temperament a poet rather than a journalist, he has given us not an article in the *Daily Telegraph*, but a soliloquy of a Cardinal, who begins by gloating over the torture of his mistress, who happens to be not a woman, but Rome (in Mr. Swinburne the Pope instead of the Revolution would have been the tormenter), and goes on to argue, with the acuteness if not with the broad suggestiveness of Bishop Blougram, that there can be no Christianity or morality for people who will not take the Pope on his own terms ; it ought to be added that if the Cardinal is less suggestive he is a better preacher, being quite in earnest, and perhaps for that reason easier to follow.

There is however one poem in the volume which seems to supply decisive evidence that Mr. Warren is capable of something very far better in kind than most of the work which he has done hitherto ; it is a serious pity that the author of "Jael" should be satisfied with the laborious accomplishment of translating the ordinary moods and im-

pressions of a cultivated man among the problems of the day into the dialect of more genial poets, though the translation may be forcible enough and finished enough to give it a certain value on the hypothesis that it is worth our while to become articulately conscious of our ordinary selves.

Even in "Jael" the writer gives way too much to the tendency to pay himself with emphasis, and to insist upon the obvious treachery because he can be very eloquent about it, and some rather coarse sneers at "the old shrewing prophetess" almost suggest that he felt the need of revenging himself upon the Bible. It would certainly have conduced to judicial and even dramatic completeness of treatment if he had remembered that Sisera deserved what he got, and that everybody at the time of course thought so. In order to be quite *Hübsch-objectiv* it would have been necessary to keep a natural preoccupation with the problem of woman's rights rather more at arm's length. Still with all these drawbacks it is a very noble poem ; both the motive that led to the deed and the revulsion after it are conceived with unmistakable original imaginative power ; one feels that the author is really animating a conception of his own, not adorning a conception out of the common stock as a superior man-milliner might dress up a lay figure. It is true that a mere intellectual theory of Jael—as a woman with a great store of fitful energy chafing under the tameness of her lot and the mean neutrality of her prudent husband, and so ready to be tempted by a decisive act which would prove to herself and others the importance of her personality, however base it might seem to her own after-judgment—detaches itself a little too sharply from the poem : at least such studies as Karshish and Andrea del Sarto, or even Simeon Stylites, seem to resist this kind of analysis and condensation. But perhaps this is only saying that even in his most admirable poem—and "Jael" is very admirable indeed—Mr. Warren has not quite attained to the *ars celare artem* which depends even more on the intensity and richness of the artistic inspiration than upon the skill with which the artist directs it, and there is reason to hope that if Mr. Warren follows his star he will attain this inspiration : he will certainly be better able than most contemporary poets to give it adequate expression if it comes.

The following extract, though the first paragraph is rather too like Mr. Swinburne, will show the force and brilliance with which the poem is written throughout, a force and brilliance to be found in other poems of the author without such a worthy central conception.

"You see I cannot weep. Does that sound well ?  
How many evil women can find tears,  
Sinning all day. My one great deed of blood  
Outweighs, as Horeb, in the scales of God  
Against some petty sand-grains. He sees that,  
Insists upon it, keeps it in his books  
In plain red flowing letters that endure.  
These women have a hundred petty ways  
Of sinning feebly. He forgets them all.  
They sin as ants or flies. He cannot praise  
Or blame such creatures, simply lets them be.

I feel all this alone with my own heart,  
The solitude is busy with God's voice  
Speaking my sin. I am worn and wearied out,  
A mere weak woman, after all is said ;  
Searching the intense dark, with sleepless eyes,  
Huddled away by the mainpole in the midst,  
A curled, crushed thing, a blurred white heap of robes  
Moaning at times with wild arms reaching out,  
While on my canvass walls the rain-gush comes,  
And the ropes scream and tighten in the blast.

So I must watch until my lord return ;  
The camp of Israel holds to-night carouse,  
And Heber sits at Barak's own right hand ;  
Because I have risen against a sleeping man,  
And slain him, like a woman. No man slays  
After this sort. The craven deed is mine,

Hold thou its honour, Heber; have thy wine,  
Among the captains claim the noblest seat,  
And revel, if thou hast the heart, till dawn,  
Brave at the board and feeble in the field!"

The lines italicised are an instance, and not the most flagrant which might be cited, of a fault of style which the author ought certainly to overcome. At a first reading the style seems as polished as it is strong; on a second we become conscious of jarring phrases just below the surface, as if they had been forced into their place instead of growing there. This fault is at once more common and more painful in the purely lyrical poems. The most characteristic of them are occupied with the question, What can love be to us when we have outlived passion? which is approached in various moods, and often with a delicacy which gives distinction to a fervour which has not attained to clearness. "A Madrigal" in many of its stanzas comes very near to the ideal of airy grace which the poem scarcely attains as a whole. There is rather too much of this sort of thing:

"Since thy lips hunger to pronounce farewell,  
And a pale mist makes bitter both our faces,  
Tear down the banner on Love's citadel,  
Lead up the rabble to his pleasant places."

This is the first stanza of a poem called "A Farewell;" there are others in the same vein. They may all be read with pleasure, but hardly with interest. G. A. SIMCOX.

#### LITERARY NOTES.

Mr. William Davis' *Songs of a Wayfarer* presented a great deal of undecided promise in various, not to say incompatible directions; his present work, the *Shepherd's Garden* (Sampson Low & Co.), shows he has chosen his line as a continuator of the old English literature of Madrigals of which Marlowe is perhaps the first master and Marvel the last. His first volume seemed suggestive because it was vague, his second may fairly be said to be an advance in simplicity and unity of impression: on the other hand we seem to see more clearly the present limits of the author's power; he has as much depth of feeling as is possible without thought or passion, as much grace as is compatible with the absence of spontaneity or independent invention; perhaps his chief merit is a sweet seriousness and a perfect sincerity. The book may be commended to readers who have not outgrown the taste for honey sometimes slightly flavoured with lemon juice, as where "The Shepherd ridicules the false charms of a Flaunting Beauty."

The author of "Sketches and Essays reprinted from the *Saturday Review*" (Blackwood & Sons) has more gall in his composition. He rails with a good deal of fluency at Private Adventure Schools, whether they submit to rank as Dames' Schools or set up as Seminaries; at the custom, which seems to have annoyed him much, of taking boys and girls to parties; at the helplessness of speakers at country dinners, and the like. The first of these subjects is sufficiently curious to make us glad of the author's information, though we could have dispensed with exaggerations that are meant to be humorous; but most of the rest of the volume would seem empty if it were simply and seriously written; as it is a lively style and plenty of animal spirits, that seem to be genuine if not quite unforced, make it amusing enough. If the writer did not care to reprint the article where he first made the joke about "the dog," he should have suppressed all allusions to it in the article on "Fashionable Scrambles in Country Houses." It is convenient to have some of the small-print articles in the *Saturday* in a book, for it would be tedious to read them regularly.

The posthumous works of Napoleon III. in exile as hitherto published (Sampson Low & Co.) consist of an abridgment of a pamphlet entitled *Principles*, insisting, not without plausibility, not even without some approach to dignity, on the shabby side of the short-sighted revolution of September 4; of some meagre though occasionally pointed annotations on the first half of the Comte de La Chapelle's history of the first three

months of the Franco-Prussian War; and lastly of a short work on the French Army and the War of 1870, of which the first part was published by the Emperor's direction in his lifetime as a pamphlet with the Comte de La Chapelle's name, though his connection with the book was only seeing it through the press. The first part shows that Napoleon III. took a good deal of intelligent pains to press upon his ministers the necessity of reorganising the army, till at last he received assurances which he had the misfortune to accept as satisfactory; but after reading the report of Marshal Landon, which is an admirable series of reasons why not to do it, we see clearly that some energy was needed to accomplish even the little that was done. The second part shows that the result of the campaign was determined by the fact that the Emperor had reckoned on an effective of 385,000 to oppose to a German effective which could not at first exceed 420,000 and was actually 338,000, while the French effective was only 220,000. It may perhaps be thought that in limiting Napoleon III.'s responsibility to this enormous misconception something is done to lighten it, and he made such atonement as he could by submitting patiently to much humiliation which it appears he felt acutely during the last three weeks of his reign.

The *pièces de résistance* are embedded in a great deal of facsimiles and enthusiasm, from which we learn in general that Napoleon III. was eminently qualified to kindle the loyal devotion of the Comte de La Chapelle, in particular that he was of opinion that M. Thiers ought to be supported because he would be an useful stopgap pending a Plébiscite, and that up to his death he was employed on elaborating a fuel-saving stove which awoke the admiration of a practical engineer—and a plan for abolishing the *octroi* without loss to the revenue—in conjunction with an illustrious financier and economist who begs the editor not to mention his name.

It is well known that a large number of the works of Petrarch are still buried in Italian and other libraries. Hr. H. Müller has recently found in the library at Greifswald a manuscript which throws great light on the petty warfare to which the poet-scholar was exposed from his obscurantist foes. It is entitled "Invectiva contra Gallum quendam innominatum sed in dignitate positum," but the subject of the tract is really an Italian, who is only described as Gallus from his residence at the Papal court of Avignon, where he had been Protonotarius fifteen years before the date of the Invective.

J. S. C. Welhaven, the founder of modern Norwegian literature, died at Christiania on the 21st of October. He was born in 1807 at Bergen, where he was brought up in a literary clique, led by the poet-bishop, Nordahl Brun, whose purist instincts tinged the whole of his literary life. Welhaven's influence was felt in every stratum of Norwegian society, but his own poetry is of ephemeral interest, mainly. He was not a great poet, but the father and teacher of poets. His critical writings possess more vitality than his verses. For some years he had been shattered by paralysis.

The review in the *Quarterly* of Princess Marie Liechtenstein's *Holland House*, which a note allows us to ascribe without indiscretion to Mr. Hayward, is less a review than a version of the book on a reduced scale, with the moral reflections omitted and a few personal reminiscences and illustrations added; amongst the latter may be reckoned some unpublished (very indifferent) lines of Rogers' on a fine tree in the grounds of Holland House, prophesying its decay, and provoking from Lord Wensleydale the following impromptu:

"I'll bet a thousand pounds, and time will show it,  
That this stout tree survives the feeble poet."

The materials collected by Sir James Mackintosh for his projected history of Holland House and the family MSS. have supplied most of what is new to the public in the original work, on which so much pains have been bestowed as to leave comparatively little to be corrected or added by the most competent critic; but readers whose appetite for the best historical gossip is slight may find Mr. Hayward's abridgment enough to satisfy their curiosity.

The *New Quarterly Magazine* (Ward, Lock & Tyler), the

first number of which has just reached us, resembles the monthly magazines in range of subjects rather than the established quarterlies; the first paper, "Travel in Portugal," is interesting from the fact that Portugal is almost unbroken ground to the tourist, while the writer does not disfigure his sufficiently entertaining notes by the most annoying and perhaps the commonest of literary offences, travellers' jocularities. The "Critical Biography of Rabelais" is a well written paper on an always interesting subject, about which it would be impossible to say anything really new without rising far above the natural level of even a good magazine. Perhaps the paper that will attract most attention is "A Spiritualist Séance" of a very impressive kind described by "Dr. C.," a sceptical man of science, who has been "almost persuaded" by the unimpeachable evidence of his own senses. A postscript follows by the gentleman at whose house the *séance* was held, describing the mechanical means by which a table and a confederate were lifted from the ground, the machinery used being concealed by the darkness; the arrangement of mirrors which enabled the conjurors actually to show one of their disembodied spirits; and, perhaps most instructive of all, the conduct of "Miss Johns," a professed medium, who had been cunningly invited to attend the performance, did a little rapping between whiles on her own account, said nothing about the cheating of the host, but was very much frightened by the trick which she did not understand, of showing her the visible phantom outline of her familiar spirit.

It is said that Berthold Auerbach has just completed a new novel, of which the scene is laid in Alsace, during the late war; the title is at present a secret.

The *Allgemeine Zeitung* (Oct. 8) publishes a long analysis of the fragmentary MS. notes of Schiller's projected continuation of *The Robbers*, of which little was previously known except the bare existence of such a project. The writer believes, from the water-mark of the paper and the character of the handwriting (which, with Schiller, varied much at different periods of his life), that it was in 1800 or 1801 that he was occupied with the scheme, though from the number of ghosts amongst the *dramatis personae* and the important part ascribed to *Schicksal* and *Nemesis* in the plot, one might have been inclined to ascribe it to an earlier date. Karl Moor was intended to have given up the idea of surrendering himself to justice, which concludes the familiar play, and after some twenty years of peaceful and beneficent life as "Count Julian" in a strange country, was to become the hero of a fresh drama made up of love, fate, parricide, and a suggestion of incest, ingredients that explain the non-execution of the work and scarcely leave it to be regretted.

## Art and Archaeology.

**Life of Moscheles.** With Selections from his Diaries and Correspondence. By his Wife. 2 Vols. Hurst and Blackett.

In condensing and editing the extensive autobiographical notes of her late husband, Mrs. Moscheles has well deserved of the history of music in more than one respect; were it only by giving to the numerous pupils and admirers of the celebrated pianist an interesting account of his artistic career and a still more attractive portraiture of his private character. The difficult task involved in the description of a life so closely connected with her own, the widow has solved with the delicate tact of true womanhood. The story is told for the greater part in the words of Moscheles himself, and wherever the editor adds a remark of her own we distinctly recognise an undertone of suppressed feeling, which, however, on no occasion interrupts, but on the contrary gives additional charm to the narrative. The plentiful materials at her disposal, viz., her late husband's letters and memoirs extending from his early youth to almost the last day of his life, Mrs. Moscheles has used with discretion, condensing and cutting out where it seemed required, and

illustrating the story occasionally from the resources of her own memory.

It is not our intention here to define the merits of Moscheles as a creative and executive artist. For a long time his name as a pianist was almost unrivalled both in England and on the continent, and to a great many of the living masters of the instrument the high qualities of Moscheles as a teacher are in fresh remembrance. To coming generations of teachers and pupils the educational advantages of his method will be illustrated by his admirable *Études*.

The private character of Moscheles appears in a most favourable light in the pages of this biography. He was the best of husbands, fathers, and friends, and the generosity of his nature, together with the universal acknowledgment of his talent from the beginning, entirely preserved him from the spirit of envy and petty animosity so common among professionals. To Mendelssohn, for instance, he was attached with the ties of truest friendship and admiration, and in reading Moscheles' letters one is occasionally struck by a faint similarity to those of the great composer. We find in Moscheles the same amiability of temper, the same appreciative openness to new impressions, without however the considerable literary skill and the occasional flavour of Attic salt which have made Mendelssohn's letters almost as popular as his compositions. In Moscheles' nature there was very little of the "Spirit that denies." His bias was altogether of an affirmative kind. He sympathised with, or at least tolerated the most divergent phases of contemporary art, and his censure, wherever applied, is always mild. But on the other hand his enthusiasm scarcely ever exceeds the limits of moderately warm approval. Indeed he was altogether the reverse of a man of extremes; one might call him a musical Halifax, the prototype of a wise and good-natured trimmer. But this ease of access to his personal and artistic nature has proved of the greatest value for Moscheles' biographical notes. It was by this means that he maintained an intercourse of a more or less intimate kind with a great number of interesting men, and was enabled to render their individual features in his memoirs. The list of familiar names we meet with in the pages of Moscheles' biography as personally known to him is of astonishing length and variety. It comprises not only the stars of his own art like Mendelssohn, Weber, Malibran, and Liszt, but also numerous celebrities in the field of politics and literature, in both of which our author felt a lively interest till the very end of his life.

It would be difficult for us to fix upon a specimen of interesting detail amongst the overpowering quantity of valuable anecdotal material contained in these volumes; but for the name of Beethoven, which wherever it appears throws all other things into comparative shade. The relations between our author and Beethoven were of a very friendly kind and greatly to the credit of the former. Their first acquaintance dated as early as 1814, when Moscheles, at that time a young and comparatively unknown musician, was commissioned by a publishing firm at Vienna to arrange the pianoforte score of *Fidelio*. The revise of the proof he used to take to Beethoven for final alterations, and in this way a friendly though slight acquaintance soon arose between the two men. The following anecdote is highly characteristic: "Under the last piece"—Moscheles says—"I had written: '*Fine* with the help of God.' He was not at home when I took it to him, and when he sent it back to me he had written underneath: '*O man, help yourself.*'" More than thirteen years after this Moscheles was to prove his faithful remembrance of the personal attachment so formed. It was partly through his energetic action that the Philharmonic Society of which

Moscheles was at that time a member, on hearing of the dying master's pecuniary difficulties, nobly resolved to render him speedy and liberal assistance. The correspondence relating to this transaction has here been published for the first time *in extenso* and forms an equally valuable and interesting contribution to the history of music.\*

No Englishman can read without pride about the feelings of gratitude which the dying lips of Beethoven vainly tried to utter for the liberality of England and its representative musical institution. Nothing can be more impressive than the following homely description of the effect of the welcome news on Beethoven as we read it exhibited in one of Schindler's letters to Moscheles: "Care and sorrow had suddenly disappeared as soon as the money arrived, and he said quite contentedly: 'Now we shall be able sometimes to have a jolly time of it again.' For we had only 340 florins in the strong box, and we had limited ourselves for some time past to beef and vegetables, which pained him more than anything else. The next day, it being Friday, he at once ordered his favourite dishes of fish. In short, his joy at the noble action of the Philharmonic Society was sometimes perfectly childish."

About Moscheles' career we have but little to add. After having established a name as one of the first of living pianists on the continent he settled in England for a number of years, and left that country only to accept the important post of Professor at the Conservatorium of Leipsic, which had just been opened under the auspices of his friend Mendelssohn. His life upon the whole may be called a singularly happy one. The brilliant success of his early youth was more than justified by the deeds of his manhood, and even the course of his declining years, attended as he was by the loving care of the most faithful and congenial of wives, ran happy and undisturbed, as quiet indeed as the following little piece of music, which was composed a few months before his death, and which we will quote in full as a kind of summing up of his career in the language of his own art. It is dated December 6th, 1869, and bears the significant inscription: "Solution is the aim of our earthly existence."

*Tempo ad libitum.*

**The Mural Paintings of Campania.** [*Untersuchungen über die Campanische Wandmalerei.*] By Wolfgang Helbig. Leipzig: Breitkopf und Härtel. 1873.

To give an idea of what may be gained by reading a book which seldom runs through a page without conveying some

new facts, or at least presenting old ones in entirely new bearings, is a task which increases in difficulty in proportion as the space for it diminishes. This being very sensibly our case with regard to the book now before us, we must claim a margin for remarks in its favour on many points which it will be necessary to pass over at present.

A foundation for the present work was laid by Mr. Helbig in 1868 by the publication of a catalogue of the mural paintings of Campania (*Wandgemälde Campaniens*: Leipzig; with atlas), to which was prefixed an elaborate inquiry into the technical procedure of ancient painters. For the volume now issued was reserved the examination of those paintings as works of art, their position with reference to contemporary Roman sculpture, and the relation of both to Greek art as it was practised in what is called the Macedonian period, that is during the government of the successors of Alexander. The first chapter is occupied with the evidence for and against the theory that art as practised in Rome during the last century of the Republic and the first century of the Empire was wholly devoid of creative power, being content to reproduce, with trifling varieties of detail, the old types established by the Greek masters. The array of facts in support of the theory is certainly formidable, and the charge of artistic poverty which they convey is the more remarkable because in those days the Roman national legends, with their many new situations and effects, stood in high favour, and presented subjects which at least Virgil and Ovid deemed worthy of their art. To say that the artists then working in Rome were Greeks by birth and education is no sufficient answer to the charge, because, had they possessed the creative faculty, they could hardly have neglected the advantage to be gained from pleasing their patrons by applying it in this direction. The second chapter is devoted to ideal sculpture, the scope of it being to show, by reference to the remains and records of art in Rome on the one hand, and to the remains and records of Greek art on the other, that the artists of Rome produced hardly a new ideal type, and never one of importance. Even a type at first sight so peculiarly Roman as that of Aeneas carrying his father Anchises on his shoulder, which occurs frequently in Roman art, is traced to a Greek model as seen on the coins of Catana in Sicily, on which is represented the story of the Catanian brothers, one of whom turned back to save his father from the burning stream of lava. It is granted that in producing types of the barbarian nations with whom the Romans came in contact, as for example the type of Germania which has been recognised in the statue of Thusnelda in the Loggia dei Lanzi at Florence, the artists of Rome achieved considerable success, though here, too, they had been preceded by the school of Pergamus, from which we still possess several figures of Gauls. The third chapter turns on realistic sculpture as seen in portraiture, in the historical representations employed for the decoration of triumphal arches and similar public buildings, and in scenes from daily life. The task here proposed is to show that in these three directions the art of Rome was the natural development of the phase of Greek art which set in during the lifetime of Alexander, and assumed very marked features in the times of his successors. It was simply the last phase of Greek art prolonged and cultivated in foreign countries. Hence the term Hellenistic, which under similar circumstances is applied to the language of Greece, has been employed by Mr. Helbig to designate this phase of its art. Its unusual length of days is to be accounted for by the constant occurrence of fresh subjects for it to handle. The artists of previous stages had been mostly confined to mythological subjects, which though abundant

\* Part of the letters referred to had formerly been published in the English translation of Schindler's *Life of Beethoven* by Moscheles (a work now out of print), and have lately been reprinted for private circulation by permission of Mr. Felix Moscheles, the master's surviving son, with the programmes of the Philharmonic Society for 1871.

had ceased to increase, and were therefore exhaustible. With regard to the realism of portraiture for which Roman artists are distinguished, we can see how completely they were anticipated by turning to the portraits on the coins of Alexander's successors; for instance, that of Ptolemy I. with his toothless mouth and furrowed face, the appearance of which suggests that what was true of Lysistratos, a brother of Lysippos, that he took plaster casts of the faces of his subjects, was generally true in the case of other sculptors of portraits in this period. To take an example from sculpture in the round, we may compare the marble portrait head from Priene in the British Museum with the most characteristic of Roman heads. As regards scenes from daily life, the inferior nature of the work renders it very difficult to determine how far the Roman artists may have worked after Greek models. As to historical representations on the other hand, such as those of the arch of Titus and the column of Trajan, it is clear from a large series of monuments and records, for which we must refer to the chapter now before us, first, that Greek art of the Macedonian period, being familiar with subjects precisely of this nature, was suited to form an excellent precedent for Roman artists, and secondly that, to judge from the scanty remains of Greek art which we possess, it actually furnished the Roman artists with several motives of composition. It is interesting, further, to note that the manner of working so as to obtain two or more backgrounds of figures which is characteristic of Roman reliefs is strongly suggestive of the grouping of figures in a picture, and that in the times of the Republic, when Rome came first into conflict with Greece, passing events of moment were represented in Rome by temporary paintings which were probably adapted from Greek models, and at any rate were executed in some cases by Greek artists.

This elaborate preliminary inquiry being concluded, the argument takes up its proper subject, painting as practised in the ancient Campania. What the end of the argument is likely to be, may be forecast from the depressing influence of the opening chapter, in which the scanty records and taunting remarks of Roman writers are arrayed. But these writers judged of the art of their time from a comparison with what they knew of the very bloom of Greek art, and, even if always qualified to judge, were certainly less liberal than we are justified in being. This much, however, is proved with abundance of detail, that the painters working in Italy during the last century of the Republic and the first century of the Empire were as deficient in imagination and creative power as were their brethren of the art of sculpture. The only faculty for which they are entitled to distinction was that which enabled them to throw the freshness and reality of their own times into compositions left ready to hand by the Greek artists of the Macedonian period. But, then, the success with which this faculty was sometimes exercised cannot be estimated with too much admiration. Nor, turning from the subject itself to the manner in which it is dealt with by Mr. Helbig, can we praise too highly his analysis of the ancient paintings which still exist, and the immense erudition which he employs to track out the original models of the Campanian painters among the scattered records of Macedonian art. If in this part of the book one chapter is likely to awaken more interest than another in this country, where scholarship has many and ancient art few devotees, it will probably be that one in which the relation between the Roman poets and their Alexandrian predecessors is discussed very suggestively, if not so fully as might be desired. Similarly adapted to scholarly appreciation is the comparison between the Greek idyllic poetry and the landscape painting of

Campania. But perhaps the vividness of his style is nowhere more attractive, nor incisive remarks more abundant, than where (xvii) he describes the changed social and other circumstances under which art was practised in the Hellenistic period, as compared with the former age of idealism. The conquests of Alexander had opened to the Greek gaze the East gorgeous in its personal attire and equipments, and unlimited in its resources for the encouragement of personal vanity. Alexander appeared in Asiatic costume, and what became the monarch was shortly found becoming to the subject. The opulence and taste for tinted luxury of the times had the effect of leading the artists, and most of all the painters, to produce works conspicuous for Oriental picturesqueness and wealth of colour. In this spirit even Apelles painted the procession of the Megabyzos at Ephesus, with his troops of eunuchs and Asiatic priestesses.

ALEXANDER S. MURRAY.

### NOTES ON ART.

We regret that in the letter of Mr. Badger on the subject of the late Frederick Ayrton's caligraphs in our last, some expressions have been inadvertently printed, which it was not Mr. Badger's intention to insert in his communication, if it was to be published in an epistolary form. At the beginning of the first and second paragraphs words occur which convey the impression that the writer was only cognisant of the decision of the Trustees of the British Museum through a report in the newspapers, and that he had used some trouble to obtain a copy of Mr. Ayrton's will. To those who know Mr. Badger's relation to this matter both these expressions will appear inappropriate, and calculated to impugn Mr. Badger's good faith. The fact is that the fault was entirely our own. Mr. Badger's communication was set up in type as an unsigned note; but when it was found that it contained not only facts, but opinions for the accuracy of which the editor could not make himself responsible, it became at once apparent that the communication, if it was to appear at all, must be signed. In the hurry of going to press, it was impossible to communicate with Mr. Badger himself: and recourse was therefore had to a friend of Mr. Badger's, to sanction in his behalf the addition of his signature. As the alternative was the suppression of the communication altogether, this gentleman, acting, as he supposed, according to the wishes of Mr. Badger, authorized the signature; and Mr. Badger's subsequent request that the communication should not be published at all, arrived too late at the office for it to be possible to comply with it. This is the way in which expressions which are manifestly absurd in a letter from Mr. Ayrton's executor, but which would have been flagrant misrepresentations of fact if made by the editor himself, were allowed to stand. We repeat that we regret that Mr. Badger should have been placed in a false position by this mistake, for which we take the entire responsibility.

A valuable report on Pettenkofer's process for the restoration of oil paintings has recently been presented to the Industrial Society of Mulhouse by F. Goppelsraeder. He points out that no colours, however stable, can retain their brilliancy unless the oil with which they are mixed retains its optical properties. Good linseed oil contains 80 per cent. of the oil which chemists call *linolein*. This substance when exposed to the air takes up oxygen, increasing thereby in weight to the extent of 10 per cent., and becomes at the same time solid. This is the change called "drying." Molecular changes occur after a time in this dry oil, by which it is disintegrated and its transparency lost. In Pettenkofer's process the vapour of strong alcohol acts on the altered oil and restores it to its original state. The picture is inverted on a box containing flannel soaked with alcohol. Pettenkofer also uses balsam of copaiba, which can often be usefully applied to the back of a picture.

The new Science Schools at South Kensington, and the bridge which connects them with the Art Schools, have been decorated in Sgraffito work by the students, under the superintendence of Mr. Moody. The process was described by Mr. Alan Cole in

a paper read at the Institute of British Architects in the spring of this year. It is certain that the use of coloured plaster has been too little cultivated by architects.

Three important bas-reliefs, recently discovered at Salonica, are about to be added to the Imperial Museum of St. Irène (Turkey). They formed originally part of the portico of Constantine, and were found near the ancient *via Ignatia*. The first represents a mounted warrior, said to be Meleager, chasing a boar. The second shows the boar, and also a serpent coiled round a tree. The third consists of two hunters, followers of Meleager. They have tunics and short swords, and advance as though seeking an enemy.

The October number of the *Gazette des Beaux-Arts* begins with a long and profusely illustrated article by Albert Jacquemart on the Chinese bronzes exhibited in the Paris *Palais de l'Industrie*. The collection was brought together by M. Henri Cernuschi during a voyage of discovery in Japan, China, and Mongolia. Many of the articles exhibited possess great beauty and interest. Alfred Darcel concludes his notice of the Tours Exhibition, and Ch. Tardieu contributes a second portion of his valuable critical account of Mr. John M. Wilson's collection. Another article on the Vienna Exhibition by René Ménard deals with the schools of England, Sweden, Norway, and Denmark. There are also interesting articles on "Aphrodite," on "Philip Wouwerman," and on Mediaeval coins.

Since Dallaway's very imperfect descriptions in his *Anecdotes of the Arts in England*, 1800, we have had no connected account of the treasures of ancient sculpture existing in the private collections of this country, except such accounts as have been given from time to time by German archaeologists, in particular those of Conze, Michaelis, and Hübner in the *Archaeologische Zeitung* of Berlin. Even critical remarks on individual collections such as Newton's *Notes on the Sculptures in Wilton House* are next to unknown in our literature. We are reminded of the want of native interest in these matters by the fact that during the past summer all the accessible collections—and thanks to the courtesy of the owners, that is nearly all—have been carefully examined by Professors Michaelis of Strassburg and Matz of Halle. The immediate object of the former was to note and obtain photographs or drawings of all Greek sepulchral reliefs for publication in the work with which he and Prof. Conze are charged by the Academy of Vienna. The object of Prof. Matz was to obtain drawings of all the sculptured sarcophagi for an exhaustive work on that subject, on which he has been for some time employed at the instance of the Archaeological Institute of Rome. Both have however made notes of the other sculptures which they found, and while Prof. Matz has already communicated some of his observations in the last number of the *Archaeologische Zeitung*, Prof. Michaelis reserves his notes for a report which will be made at some length to the Academy of Vienna.

A new Bourse, built after the plans of M. Léon Suys, will be opened in Brussels in December.

We learn from the *Moniteur des Arts* that a new gallery of sculpture will shortly be opened in the Louvre.

The well-known engraver, Léopold Flameng, is now in Holland, engraving Rembrandt's celebrated "Night Watch."

An exhibition of the works of Winterhalter is being arranged in Basle.

A cast from the sculptured metope found by Dr. Schliemann, representing Helios in his chariot, has just arrived in the British Museum.

## Theology.

Histoire des origines du christianisme. Livre iv., L'Antechrist. Par Ernest Renan. Paris: Lévy. 1873.

THE present volume begins with St. Paul's arrival at Rome, and ends with the destruction of Jerusalem. During this period Christ was glorified in the death, as in the life, of his greatest servants. The opposite of Christ seemed to come to a kind of glory in the career and even in the disappearance of Nero. For as prophecy shaped itself more definitely in the fulness of time, it was imagined that evil, in order to its defeat by the only power which could defeat it, must reach its full historical realization in an inverted image of Christ. The name belongs to a somewhat later date, but not the thing. At least it is the leading thought of the present volume that Nero was invested with this character in the eyes of those who survived his persecution, nay was in fact to Christianity a sort of second founder by antagonism.

The idea is worked out with not less on the whole than the author's well-known power, but with an appearance sometimes of want of finish, due perhaps to the miscellaneous quality of the matter. In fact the book has not the unity of its title: but a sort of kernel is formed by ch. vi.-ix., xiii.-xvii., which deal with Nero, the epistle to the Hebrews, and the Apocalypse, and are inspired by the thought of the antagonism between Christ and Antichrist, above all by the recollection of the great persecution of 64.

There are not many writers in whom it would be judicious, but M. Renan is doubtless right in describing these horrors with little reserve (ch. vii.). The most forcible pages perhaps in the volume are those which insist on their immense historical importance in establishing the enthusiastic tradition of passive resistance; Nero being finally presented as the not absolutely unconscious creator of the aesthetic ideal of Christian womanhood. The strictly literary critic would have several things to say of this passage. But in this place

it is necessary to avoid even the historical questions connected with the persecution, which are raised by M. Renan's use of his authorities: as well as the rich archaeological illustration, which is to this volume what scenery and topography were to the others.

The Christians who survived the crisis, or an important number of them, escaped from Rome. This has been inferred by others from the mention of Italians apparently out of Italy in the epistle to the Hebrews (xiii. 24): M. Renan decides that they went to Ephesus (p. 206). Antichrist accompanies them eastwards in more than one form, and at any rate in a state of feeling and imagination described (p. 202) in language which reminds one of what we have read about the Parisian mind after the late siege. The evidence is the Apocalypse four years later; and St. John is inferred to have been of the number. Meanwhile Barnabas, who is also of the number, collects, confirms, and reconciles the church of Rome by means of what has since been called the epistle to the Hebrews (pp. 210 ff.). M. Renan, like some other critics, thinks the notices of persecution in this epistle apply naturally to Nero's at Rome, although, unlike other critics, he has aggravated the difficulties of this interpretation by his sensational diagnosis of the writer's mental atmosphere. It may be asked how the supposed circumstances agree with the scholastic disputation which forms the vehicle if not the substance of so much earnest pleading in the first two-thirds of the epistle. But these things are not what M. Renan finds there. He recognises no effort to produce theoretical conviction, still less any apprehension of a relapse into Judaism; the doctrinal reasoning is refined into a sort of effusive doxology over the happy extinction of worn-out controversy. This, remember, in 65 or 66; for here again the interpretation is not so strange as its adjustment to given or assumed conditions. In the matter of this reasoning, what most strikes M. Renan is its Pauline indifference to Christ's earthly life (pp. 221 f.; comp. p. 60, perhaps an indirect reply to Dr. Keim's remarkable chapter on the gospel according to Paul); he is less interested in the differences between "Barnabas" and St. Paul (which no doubt it is easy to exaggerate) than in their common distance from "the precepts of the lake of Gennesareth." Yet one misses more in him than in more professional expositors all impression of those touches of human sympathy and of capacity for temptation which would alone make this epistle unique in the New Testament. The most permanent value of the epistle he finds in the elimination of sacrifice from religion; by which it carried on, he says, the work begun by Isaiah. Here however the writer casts much of his bread on the waters, as M. Renan seems to admit in the last lines of this tenth chapter; and his chief services to his generation are his exhortations to endurance, his rigorous judgment on the lapsed, and above all his efforts to strengthen the Church by means of the memory of the departed. M. Renan adds *to unite*, and makes the epistle to the Hebrews consolidate a reconciliation which has been effected by the persecutor.

If we omit the grotesque tragedy of Nero's death (ch. xiii.), Antichrist next appears, where he would first be looked for, in the Apocalypse, which is minutely but not very formally expounded (ch. xv.-xvii.); with great artistic effect, and with more sympathy than would be expected by a reader who lighted first on the general observations at the end (pp. 473-480). What is there said about the Jewish exclusiveness of the book is serious criticism; though one would have expected that some room would have been made for the ascetic element, whatever its relation to Judaism. So is the comparison with the Gospels; and there is an excellent remark, if less happily phrased than

usual, about the relation of the Apocalypse to religious art and the sacrifice of grace to gorgeousness. But the theology is not treated with justice. There is a time certainly for weighing coolly even such words as those about wiping away tears; but M. Renan appears to class them with the description of the city and its precious materials. The passage will be read however with respectful interest for the sake of M. Renan's own theological confession. The vision, it is taken for granted, is a vision in the sense in which Mr. Tennyson's *Vision of Judgment* is a vision. The interpretations, which are not discussed except in desperately doubtful cases, but are assumed and applied in course of description, are mainly those of the usual Nero solution; the key of the whole being that popular expectation of Nero's return\* which would no doubt occupy a far larger space in our historical imaginations, if we had Tacitus's account of its consequences, including what the introduction to his *Historiae* shows he considered one of the capital events of the Flavian generation. Of course the "number of the name" (xiii. 17 f.) is the numerical value of Νέρων Καίσαρ in a Semitic alphabet for the usual reading 666, or of Nero Caesar for the variant 616. As this double coincidence gives, not a more or less appropriate epithet of a more or less determinate object, but the proper name of the man otherwise indicated, as shown on his coins in the province in which the book appeared (p. 417), it is quite right for a critic, who does not take advantage of any hypothesis of supernatural prediction, to pass in silence the very existence of innumerable competing interpretations. The only shade of difficulty is the absence of Ϟ after the Ϟ which stands for the K or C. M. Renan accepts the explanation that this not in itself surprising *scriptio defectiva* was adopted for the sake of the talismanic-sounding number it gives: but it would be more satisfactory to have a case exactly in point earlier than the third century. With a more analytical treatment than M. Renan's it would be remarked that to make Nero the subject of this part of the book does not fix its date to the year after his death. What does fix the date is, besides the proximity of the persecution before and the siege of Jerusalem after, the symbol of the seven heads (xvii. 10 f.). On this it has been asked, Where are we to begin? Which way are we to count? How many are we to leave out? According to the solution substantially adopted by M. Renan the answer is, Begin at the beginning, count in the only direction then possible, and leave out none. However there is a question whether the beginning is at Julius as in the 5th book of the Sibylline Oracles, or at Augustus as in the 10th. And here M. Renan surely confuses what on his principles is a plain matter; thereby somewhat spoiling what he has done towards popularizing the common-sense exegesis which gives us history instead of riddles. Julius is the first of the Caesars, but Augustus is the first of the Augusti or Σεβαστοί; and M. Renan accepts Σεβαστὸς as the name of blasphemy (p. 413, Apoc. xiii. 1, comp. σέβασμα, 2 Thess. ii. 4): yet he insists on beginning with Julius (pp. 407, 432). So Nero becomes sixth and would naturally be the *one* who comes after the *five* and *now is*; and accordingly some who have begun with Julius have consistently dated the book under Nero. But M.

\* Not from the dead, according to M. Renan (pp. 317 ff., 351), as the theory is sometimes stated, especially by those who wish to discredit it, but also by Dr. Hilgenfeld, who with Dr. Volkmar supposes the pagan Nero-legend derived from the Christian. *Z. f. wiss. Theol.* 1869, iv. 424 f., 436, 445. The Apocalypse seems to avoid saying what is become of Antichrist. See xiii. 3, 12, 14, xvii. 8, 11; and even 10; for ἔρεω, in which some find a difficulty, may have been chosen in order to include Nero's case along with that of the unquestionably deceased emperors:—not indeed according to M. Renan's view of the seven heads, but according to the more usual one.

Renan, who like other people makes Galba the *one*, supposes Nero passed over at his historical place, and his return predicted in the *other who is not yet come*. This seems to torture v. 10 f. sadly; the motive being no doubt the supposed advantage, not of beginning with Julius, but of limiting the predictive part of the prophecy to Antichrist, and ignoring any real successor of Galba's. But it is clearly Tacitus's view that to provide Galba with a successor was, for some time before it was done, the business of policy, conspiracy, and gossip (*Hist.* ii. 12 ff., 23); and the writer to the seven churches was not obliged to make up his mind between Vitellius, Otho, and Piso Licinianus. To suppose the succession already in prospect would fix still more firmly M. Renan's date of January, 69 (pp. 352, 355, 436-9, 487 f.). Of Harmagedon (xvi. 16) M. Renan despairs (p. 428), disdaining the modern refuge of vagueness. He professes as critic (p. 422) to despair of the False Prophet (xiii. 11 ff., xvi. 13, xix. 20, xx. 10), but is more confident as historian, informing us (p. 353) of an ardent partisan who by various means, including miracles, obliged people to recognise either the sham Nero or the imaginary one.

Dr. Volkmar's solution of this last vexed question is barely alluded to (p. 420): but, as readers of *S. Paul* know, M. Renan accepts the opinion that St. Paul and his followers are the heretics denounced to the seven churches, or rather to five of them; and no one would look in this volume for further facts in support of his view of St. Paul's relation to the other apostles. But the volume throws light on the line of thought which has determined his judgment. M. Renan has an inclination to admit the antiquity and genuineness of epistles and the like, apparently out of proportion to his readiness to deal freely with narrative testimony. To a man who thinks the Apocalypse apostolic and the epistle of James and the first of Peter genuine, while he is always ready to treat particular statements in the Acts as coloured by the writer's general views or intentions, a theory like M. Renan's, which detaches St. Peter from the other "pillars," must appear to lie on the face of the facts. This intermediate position is not exactly inconsistent; but perhaps it has less solidity than either of the extreme ones: nor would it be the only case in which M. Renan adopts a powerfully supported theory with modifications which endanger its stability. Thus ch. iv., "*Dernière activité de Paul*," is a suicidally forcible statement of the theory which traces the theology of the later epistles to the circumstances of St. Paul's life at Rome. There is little attempt to attenuate the transformation; in fact it may be said that Baur's century of evolution is squeezed into four or five cataclysmic years; thanks, partly to the "effect of imprisonment on powerful minds," partly perhaps to external forces at Rome (pp. 24, 74 f.): yet a parallel movement, we are significantly told, went on in Asia Minor (p. 84). St. Paul's capacity for conversion suggests some curious meditations on his conceivable mental course after we lose sight of him (pp. 101 ff., 200; comp. 76 and *S. Paul* 373). His fate is left very doubtful: but here and with St. Peter M. Renan loves to indulge tradition just enough to justify enlightened pilgrims in meditating on possibilities over every consecrated site. That St. Peter was at Rome M. Renan is pretty certain, more than that St. John was at Ephesus. The discussion (pp. 554, 29, 187) is remarkable for employing Dr. Lipsius's analysis of the Ebionite legend to support the theory that this is founded on fact. Dr. Lipsius, indeed, might draw this inference, if he was so minded, because he traces the legend high up and makes it point to Rome from the first.\* But then (and this is what weakens the

argument in M. Renan's hands) what it says of St. Peter it says of Simon Magus. This is as it should be if Simon is scarcely anything but a caricature of St. Paul, who was certainly at Rome. M. Renan however regards Simon as an independent historical character, who, though his name came to be imposed on St. Paul, may really have been at Rome among other adventurers (p. 28): *may* have been, for M. Renan, reversing the famous epigram, is very doubtful of Simon while pretty sure of Peter. Surely, if the legend took such liberties with the identity of the one champion, it is poor evidence for the movements of the other. The first epistle of Peter is the subject of some very beautiful pages (ch. v.), and the chapter on St. James (ch. iii.) is a fine example of the author's power of illustration. It is one of several on Jewish affairs, which have more novelty about them than most of the rest: but they are less connected with Antichrist or the Beginnings of Christianity. Something must be omitted; and it is time to turn to the discussion of literary dates, authorships, and the like.

The only problem of the kind which is closely discussed is that of the authorship of the Apocalypse, which has lately entered a new phase. Formerly the criticism of the Apocalypse was a good deal sacrificed to that of the fourth gospel. Assuming that they cannot both have been written by the same hand, those who said the gospel was apostolic were logically obliged to deny this of the Apocalypse, and those who denied it of the gospel were illogically tempted to affirm it of the Apocalypse. But from the beginning of the century it has occasionally been asked, and six years ago it fairly became an open question, whether St. John can have written either of them; whether indeed he was ever near Ephesus at all. M. Renan's is perhaps the first important work which has approached this question in the interest of the Apocalypse; and he has the advantage of being able to attribute the book to the apostle (or rather to a disciple writing under his approval—p. xli.) unaffected by the old bias. His remarks (pp. 557 ff., xxi. ff., 207) are a good instance of the intellectual candour which admits the gravity of an objection which it is not prepared to dispose of. Here the objections are chiefly arguments from silence,\* which have been met (*Z. f. wiss. Th.* 1872, iii. 382) by supposing two partisan traditions, one systematically ignoring St. John, the other St. Paul: but M. Renan does not avail himself of this explanation. In dealing however with the much discussed fragment (*Eus. H. E.* iii. 39) in which Papias describes his way of investigating tradition, he cuts the knot in two places. To meet the difficulty of St. John's being mentioned only among other apostles who have nothing to do with "Asia," and that low down in the list, he proposes (app., p. 562) to leave out St. John's name. Elsewhere (pref., p. xxiv) he would insert *μαθητῶν* before *μαθηταί* in the clause *ἃ τε Ἀριστίων καὶ ὁ πρεσβύτερος Ἰωάννης οἱ τοῦ κυρίου μαθηταί λέγουσιν*, to save the apostle from being superseded by the elder. The former emendation is justified in terms which make the elder identical with the apostle; and the latter must be intended to supersede it, for M. Renan leans strongly towards making him approximately contemporary with Papias (comp. p. 345.) Yet, assuming that contemporaneity is what the present tense *λέγουσιν*

\* In this connexion is not some attention due to the fragment from one Pionius containing part of a life of Polycarp, worked up by Halloix (*Illustrium Ecclesiae orientalis scriptorum vitae et documenta, Vita S. Polycarpi*), who gives a few extracts from the Greek original, and translated in the *Acta Sanctorum* for Jan. 26? Some of it must have done duty in a Symeon metaphrastes used by Valois (comp. *Eus. H. E.* v. 24, note 6, with Halloix, viii. note k.) It begins with St. Paul, and brings Polycarp to grey hairs and the episcopate without mentioning St. John.

\* *Petrussage*, especially pp. 16 ff., 81-84.

indicates, still, since Papias gets at his authorities only through persons who have frequented them (εἰ . . . . παρηκολούθηκός τις, curiously analogous to the Successors of the Companions of Mohammed), strict contemporaneity is so irrelevant that a very loose approximation will do. The elder might therefore be sufficiently contemporary with Papias, and a disciple of the Lord as well: we have only to make him live on as long as the apostle is commonly supposed to have done. However it is further argued that at any rate he cannot be the writer of the Apocalypse, else we should read of such an important person in the N.T. The consequence is that M. Renan joins issue, not with those who after Dr. Keim consider the Apocalypse to be by a John distinct from the apostle, but with Professor Scholten, who regards it as claiming to be nearly what M. Renan regards it as being, another person's report of things the apostle is supposed to see;—a nicety, by the way, which M. Renan omits to recognise. The greater part of the appendix is devoted to showing the special inconveniences of this form of the hypothesis, and to meeting certain minor assaults. On the whole he decides that the testimony of Polycrates (Eus. *H. E.* iii. 31) and Irenaeus outweigh all objections to St. John's presence in Asia; and that the authorship follows, chiefly because there can have been no one else who could take the same tone to the seven churches. It is curious that he makes no application of his own remark (p. 459) that Irenaeus's ignorance of the secrets of the Apocalypse goes far to damage his testimony to Ephesian traditions.

The other questions of literary history are very lightly treated. Some space is devoted to the epistle to the Hebrews (pp. xiii-xxi, 211, 217, 219 f., *S. Paul* lii-lxi); but we do not even get a word of the promised discussion (*S. Paul*, p. lxi) of the passages understood to imply that the epistle was written while the temple and its ritual subsisted. The argument for the address to Rome perhaps only requires concentration to be effective; that for Barnabas's authorship comes to this, that he is second-best in each line of competition. On the whole the motives of M. Renan's decision are less to be sought in formal argument than in the ease with which the hypothesis is supposed to fit into "an organically conceived narrative." This is still more true of the epistles of James and Peter (the 1st), with respect to which the test is expressly invoked (p. xi). They are pronounced genuine, and approximately dated by subtracting *one* from the year of martyrdom. St. Paul's epistles were discussed in the preceding volume. However there is a curious oversight which lets us see that the *circular* theory of the epistle to the Ephesians does not harmonize after all with M. Renan's "literary experience." If the reader examines p. 86, I think he will decide that it is felt indispensable to read *ὑπὲρ ὑμῶν* in Col. i. 7 "with the Sinai MS.," which unluckily reads *ἡμῶν*. M. Renan is elsewhere at issue with Dr. Tischendorf in citing this MS.: see pp. ix (1 Pet. v. 1), 383 (Apoc. v. 9), 411 (xiii. 1, fault of T.'s last ed.?), 444 (xix. 12, palaeographers' guesswork).

These genuinenesses are often of the secondary sort; much of the work being thrown on those "secretaries" who, Dr. Keim says, have never been fortunate in N. T. criticism. One object is to account for appearances of borrowing; only it is wonderful sometimes that the results of such secondary work should have won so much of the world's attention. Imagine Coleridge commenting Leighton on St. Peter's secretary excerpting St. Paul's secretary, who excerpts the epistle to the Colossians (pp. vii f.). The indebtedness is often a fact independent of any theory to account for it: but to throw it on the secretary is to throw it on poverty of ideas (pp. 112 ff.); whereas if the epistles are spread over a longer space of time the common phrases

become more like what they are now, language hallowed by many memories.

This fourth volume has brought us to the end of the period which in M. Renan's opinion closed the first great conflict among Christians, and details the outward events which he believes to have done more for this result than any efforts at mediation. Antichrist in fact reconciled St. Peter and St. Paul. The next volume (see pp. 201, 477, 300, 544, xxv, and the cover) is to try and tell us what they were reconciled in.

C. J. MONRO.

The Plan of St. Luke's Gospel: a Critical Examination by Rev. William Stewart, M.A., B.D. Glasgow. 1873.

WE must confess to having taken up this little treatise with a feeling of hopefulness, and to having laid it down with one of disappointment. The principles and the method (pp. 7-12) with which the writer starts are excellent. His conclusions (p. 97) appear to us, in the main, perfectly sound; and there can be no question that the intermediate portion has been worked out with great patience, conscientiousness, and ingenuity. But the result, we are obliged to think, is for the most part wasted labour.

Mr. Stewart's essay practically resolves itself into a discussion of the portion of the Gospel, ch. iii. 21—xviii. 14. This he divides at x. 24 instead of at ix. 51 as is usually done. Of these divisions the first is triply subdivided: α, iii. 21—iv. 22; β, iv. 23—viii. 3; γ, viii. 4—x. 24. And the order here is explained as topical. This is the most characteristic part of Mr. Stewart's theory. He supposes that each of the subdivisions has a sort of heading or text which is worked out in what follows. Thus in (α) the heading consists of iv. 21-23. To the account of the Baptism with its three moments, corresponds the account of the Temptation with its three moments; to the statement of the age at which Jesus began His ministry, the notice of the beginning of that ministry, iv. 15; and to the tracing of His supposed parentage, the visit to Nazareth with the question, "Is not this Joseph's son?" iv. 16-22. In (β) the heading is taken from the remainder of the discourse in the synagogue at Nazareth—it will be observed that the section here begins in the middle of a narrative—the several topics of which are paralleled by events at Capernaum, others which exhibit the prophet like Elijah, and like Elisha, the rejection by the Scribes and Pharisees, and the progress of the Messianic work—these events being ranged in a curious system of double columns. The heading of the third subdivision (γ) is found in the parable of the Sower, which is supposed to be illustrated by the rest of the narrative in this section.

In the second of the two great divisions Mr. Stewart thinks that the order is alphabetical, the different subjects being classified lexically under ἀγαπᾶν (three sections), αἰτεῖν (three), ἀντιλέγειν (one), βλέπειν (two), γενεά, &c.

This last suggestion is very ingenious, and we should be sorry to say that it may not have something in it. Several distinct analogies might be quoted in its support, e.g. Selden's Table Talk and the alphabetical Psalms. But it is hardly, in any case, tenable in this form. The division begins in the wrong place. The methods by which the sections are brought under the proper letter are often very forced. Thus the episode of Martha and Mary comes under ἀγαπᾶν, which is made to = "entertain"; the blasphemy against the Holy Ghost comes under ζύμη; the salt losing its savour is represented by στερεός; the five sections from xvi. 14—xvi. 31 all come under χαίρειν. There is besides the difficulty that, so many of the passages being found also in St. Matthew, the inference seems to follow that the alphabetical arrangement (supposing it to exist) was due to St. Luke himself and not to

the earlier writer from whom he borrowed. But in that case the signs of it would scarcely have been so much obliterated.

The other part of the theory which relates to the first main division with its subdivisions seems to us quite incredible. Indeed it out-herods Herod by its portentous subtlety. It goes beyond even the most fantastic of the Germans themselves. We hardly need stay to point out the arbitrary divisions, the far-fetched and unnatural connections which it assumes, and the absence of any instance of a document constructed in a similar manner—for though the Apocalypse is constructed artificially enough, it is with a much more naïve kind of artificiality. Mr. Stewart has made the radical and fatal mistake of basing his results upon the synopsis of Matthew and Luke without including that of Mark, and of considering simply the order of the narratives without regard to their internal verbal relations. If he had done this he would have found that the second Gospel is the true starting point. For its higher originality is proved by the fact that the proportion of coincidences between it and the other two Gospels taken separately, as compared with that between Matthew and Luke, is roughly speaking about 8 to 1, while the proportion of coincidence with Luke alone as compared to that between Luke and Matthew is nearly 3 to 1. Mr. Stewart's method, though sound as far as it goes, is incomplete. If he had taken in a wider range of phenomena we think he would have seen that his present theory is untenable. We hope he may make another attempt with better fortune.

W. SANDAY.

#### NOTICES OF NEW BOOKS.

*The Land of Moab.* By H. B. Tristram, M.A., LL.D., F.R.S. (Murray). The general verdict of critics as to the meagreness and inaccuracy of Dr. Tristram's geographical contributions appears to be only too well founded. The most important of the sites which he claims to have either recovered or verified have been long ago fully identified by Seetzen and other explorers, while the so-called discovery of Zoar on the brow of a hill 3000 feet above the valley is on philological as well as exegetical grounds too improbable to be accepted. These points have been already sufficiently dwelt upon in the *Athenæum* and other journals. But one "discovery" of Dr. Tristram has not as yet been examined with the attention it deserves: we refer to the remains of what he supposes, on Mr. Fergusson's authority, to be a palace erected—on the borders, remember, of the Arabian desert—by the Persian king Chosroes II. A competent American reviewer in the *Independent*, Sept. 18, speaks thus of this singular hypothesis. It "is founded merely on the least valid portion of the ornamentation as ground of reasoning, while throughout the account attention is drawn away from the characteristics which must go to determine the age of the structure. This least trustworthy portion of the ornamentation is the elaborate sculpture of vines and animals on the tympana of the façade. This, according to Mr. Fergusson's own statements, had its parallel in Christian Syria. Why then refer even this part of the work to Persian art and to the time of Chosroes? On the other hand, attention is drawn away from the wide base, the W shaped cornice and the running capital, all of which are Corinthian; also from the basilica within, which plainly shows not only its apse, but three perfect ones. . . . This part of the place was evidently the chapel of the structure and forms an insurmountable obstacle to the Persian palace. A Sassanian monarch never would have ornamented any building of his by all the Corinthian and Byzantine carving there is here in cornices and capitals, bosses and bases. It would be entirely at variance with his ideas, his tastes, his wishes, as well as beyond the power of his artists. Dr. Tristram indulges in a strange remark—"We found no other ruin in the whole country which bore the slightest resemblance to Mashita, either in situation, design, or execution"; which is presently belied by his own account of a neighbouring ruin, Kustul—evidently being another Mashita. . . . We sincerely regret to find Mr. Fergusson thus committed to a hasty opinion. His restoration of the palace, facing the title-page of Dr. Tristram's book, is as beautiful and unsubstantial a castle as any that were ever dreamt of as existing in Spain."

Profs. Milligan of Aberdeen and Roberts of St. Andrew's have produced a handy volume (T. & T. Clark, Edinburgh) entitled *The Words of the New Testament*. Though modestly designed "for popular use," it will be found useful to the student as a carefully compiled handbook of the "lower criticism." Part i. contains a sketch of the facts relative

to various readings: a concise account of the MSS. and versions: a list of early writers who cite from the N. T., which would have been more useful had the various books from which he cites been mentioned with each author: and a somewhat too brief sketch of the history of modern biblical criticism. Part ii., entitled "Mode of Dealing with the Facts," points out the several steps in classification which result in the determination of the text on principles of external and internal evidence. Part iii. deals with the most important cases of variety of reading arranged by chapter and verse, registering the readings adopted by the most approved scholars.

Canon Cook has published a pamphlet (Murray) on the inscription of Pianchi-Meramon, containing a translation of the inscription, and an essay on its relations to Isa. xviii., xix. Readers of the *Revue archéologique* will find but little which is not drawn, with due acknowledgment, from papers of M. de Rougé and M. Lenormant; but as the latter have escaped the attention of recent writers on Isaiah, Canon Cook has done well to introduce them to a larger public. His own accuracy as a translator of hieroglyphics is guaranteed by no less an authority than Dr. Birch, but we notice with some surprise his return to several antiquated renderings of the Hebrew, and his slightly too acquiescent attitude towards M. Lenormant, not merely as an Egyptologist, but a biblical critic.

It is impossible to give more than a passing notice to the commentaries on Romans and Galatians by Profs. Lipsius and Holsten, which distinguish themselves by their greater thoroughness from most of the other portions of the so-called *Protestantenbibel des n. T.* (Barth, Leipzig), to Clark's English edition of Keil on Ezra, Nehemiah, and Esther (a laborious and useful but uncritical work), and to the fourth edition of Schenkel's *Charakterbild Jesu*, a really good translation of which, from the third edition, is published by Messrs. Longmans.

The long-expected first volume of Grätz' *Geschichte der Juden* is coming out in parts.

#### Contents of the Journals.

*Centralblatt*.—Three specially good articles must not be overlooked. —1. Oct. 4. Overbeck's "Programme" on the epistle to Diognetus; comp. *Academy*, No. 64, p. 27. The reviewer thinks Dr. O. has succeeded in showing that all the received arguments for dating the epistle in the first half of the second century rest on a misconception, and that its composition after the close of the second century is not excluded by any data as yet elicited from the work; also that in its controversial method and description of Christianity it differs in many respects from the apologetics of the second century. Still the reviewer is not convinced by the arguments of the author. The peculiarities of the work admit of natural explanations without referring it to a later than the second century. In particular, its secular cast of thought can be paralleled from other writings of a tolerably early date; comp. the bold saying of Tertullian, "Unam omnium republicam agnoscimus, mundum" (*Apol.* 38). And this is not its only point of contact with Tertullian's *Apologeticum*. Further, the Pauline doctrine of man's incapacity for justification by his own works appears disjoined from the doctrine of the Law, not only in our epistle, but in Catholic writings of the end of the second century (e.g. Irenæus), to which period Zeller, Hilgenfeld, and Keim agree in assigning the epistle. —2. Oct. 11. *Celsus' Wahres Wort*; von Theodor Keim. This is a translation of the copious fragments of Celsus' work against Christianity preserved by Origen, with a running commentary, and a minute analysis, in which the sections on the philosophical and religious position of the author, his knowledge and estimate of Christianity, the date and place of composition, and the authorship of the work, are specially mentioned. Also two small dissertations on "two contemporaries of the *True Word*," viz. Lucian, with reference to his Peregrinus, and Minucius Felix, with special reference to the grounds urged against Christianity under the name of Cæcilius. Keim has shown, among other points, that the so-called "Epicurean" Celsus, the contemporary and friend of Lucian, is identical with the Celsus of Origen. He also gives good reason for dating the *True Word* in the time of the persecution under M. Aurelius. —3. Sept. 13. Böhl's *Inquiries* after a popular Bible in the time of Jesus, and its connexion with the LXX., is analysed by Nöldeke, and its surprising results shown to be without a foundation of sound scholarship.

*Theological Review*. October.—Christian Pantheism; by C. B. Upton. [Review of Picton's *Mystery of Matter*, an eloquent but inconsistent attempt to reinstate theology on a Spencerian basis.]—On a passage in Genesis; by the Bishop of Natal, and Russell Martineau. [A reply to the arguments of Prof. Martineau for separating Gen. ii. 1-3 from the Elohist narrative. See *Theol. Review*, Jan., 1873. Mr. Martineau makes an able and satisfactory rejoinder.]

*Monatsschrift für Gesch. u. Wiss. des Judenthums* (ed. Grätz). June-October.—The sons of Herod; by Dr. Braun. [A most careful biography, containing valuable illustrations of the Gospel narratives. The author comes into frequent collision with Dr. Keim.]

—Justin Martyr and the Aggadda; by Dr. Goldfahn. [Conclusion of a series of papers comparing the references to Jewish Aggadic traditions in Justin with the Aggadic statements in Jewish writings.]—History of the revolts of the Jews under Trajan and Hadrian; by Dr. Neubürger. [I. The revolt under Trajan; its well-concerted plan points to some eminent person as leader; good reason is shown for supposing this leader to have been the famous Rabbi Akiba.]—The rhythmic structure and age of Ps. xxix; by Dr. Grätz. [Dr. G. points out a fourth kind of parallelism, which has not, he thinks, been sufficiently considered,—the “palillogic,” which consists in the emphatic repetition of a single word or several words. It occurs frequently in the Song of Deborah, and also in Ps. xxix. The reference in the latter is not to ordinary phenomena of nature, but to some terrible catastrophe, and probably to the earthquake under Uzziah, comp. Amos i. 1, Zech. xiv. 4, 5.]—Lexical and archaeological material in the Talmud; by Dr. Zuckermandl.—Ibn G'anach's Book of Roots, review.

### Philosophy and Science.

*Autobiography.* By John Stuart Mill. London: Longmans. 1873.

THIS book, the profound and engrossing interest of which it would be difficult to exaggerate, might perhaps be more justly styled “*Apologia pro vita sua*,” or “*History of My Speculative Opinions*,” than “*Autobiography*.” As the story of a life it is far from complete, but it is a faithful record of the growth of a mind of exceptional force, and of a character of signal elevation. The popular estimate of Mr. Mill, previously to the time when his entry into Parliament revealed somewhat of his true character to the world at large, was generally that of a narrow logician, a cold and unsympathetic reasoner, and a virulent because a mere speculative Radical. Never was popular estimate more ludicrously false. Mr. Mill's *Logic* was precisely the success it was, because extending the narrow limits of its predecessors it strove to bring the theory of method into some harmony with the ever-widening range of scientific inquiry; his political and social reasonings were quickened and elevated by a vehemence fervid but restrained; while so far from being a mere speculative politician, Mr. Mill was for six and thirty years of his life officially and intimately connected with one of the main branches of England's imperial policy, and was more directly responsible for its springs and issues than any of the more prominent statesmen of his time. Those who were at the pains to form a truer estimate of Mr. Mill from a study of his writings—and

there are many on whom those writings have had as profound and lasting an influence as those of any contemporary teacher—have long been aware that his salient characteristics were a solid though somewhat narrow culture, a moral sense singularly elevated and rigorous which but for his early training must inevitably have taken a religious turn, and an almost womanly vehemence of feeling restrained, though barely restrained, by the early and doubtless abnormal cultivation of his reasoning faculties. There can be little doubt that Mr. Carlyle hit the mark when, as we learn from the *Autobiography*, he read in his Scotch retreat a series of articles published anonymously in 1831 by Mr. Mill on “*The Spirit of the Age*,” and exclaimed, “*Here is a new Mystic*.” Mill repudiated the title, and afterwards tried, with doubtful success, to convince Carlyle that he was mistaken; the latter only replied that his friend was “as yet consciously nothing of a mystic”; consciously and openly he never became one, but in his character the mystic and even the ascetic were never very far from the surface, though training and circumstances forbade their outward growth. It would be idle to compare the life and influence of Mill with those of one whose *Apologia* the *Autobiography* in more than one respect resembles; but it may be said, perhaps, with truth, that had Mill been brought up a Churchman he might have written a “*Grammar of Assent*” and ended his days in the Oratory.

The time has not yet come, nor is this the place, for a critical estimate of the life and writings of Mill: we cannot do more in a short notice like the present than indicate without even detailing the many points of interest with which the *Autobiography* abounds. It is not a life, as we have said, nor does it pretend to be so, but it is the history of a mind, and may perhaps be fitly described in a few words as “*The Nemesis of Benthamism*”: it is the struggle of a mind of no ordinary power to shake itself free from the trammels of perhaps the narrowest system that was ever proposed as a theory of life. James Mill was not merely a Benthamite Radical, but a Scotchman who had discarded his own religion and looked upon all other religions as pernicious, austere, rational, without sympathy or sentiment; but he devoted himself with noble self-sacrifice to the education of his son, and gave him a training which both for its merits and defects was singular and exceptional. It is impossible not to respect the process, equally impossible not to deplore the result. As far as mere education is concerned Mr. Mill began life, as he truly says, a quarter of a century in advance of his contemporaries; but for all that makes life best worth having and raises a character to distinction he began life with nearly everything to learn and a great deal to suffer. He cannot recollect when he first learnt Greek, but has been told he began it at the age of three, and he pursued his studies at his father's side, the latter constantly supplying the want of a dictionary in the midst of writing the *History of British India*; at thirteen his father chides him without mercy for being unable to explain what he means by “*idea*,” and at an earlier age he is set to teach his brothers and sisters Latin at the time that he is learning it himself; he says his childhood was happy, but it can never have been childlike, and though he speaks of his father with touching respect and noble candour, it is manifest that their hearts never met, and that their intellects moved ever more widely asunder. Though his early training was almost exclusively in Greek and Latin, it is evident that he never completely assimilated the teachings of Classical Literature, and that its deepest sources of influence were almost wholly closed to him. The quotations in his works are notoriously inexact, and though before the age of eight he had read the lives of the philosophers by Diogenes

Laetius, he could in 1866 make the astounding statement that the first two chapters of Grote's *Plato* "contain as full an account as our information admits of the forms of Greek philosophy which preceded Socrates." He issued from his father's training a Benthamite Radical, a something for which he confesses the designation "a mere reasoning machine" would not be altogether inappropriate; the "Traité de Législation" was his gospel, and the reform of the world was his creed.

"I am one of the very few examples," he says, "in this country, of one who has not thrown off religious belief, but never had it; I grew up in a negative state with regard to it. I looked upon the modern exactly as I did upon the ancient religion, as something which in no way concerned me. It did not seem to me more strange that English people should believe what I did not, than that the men that I read of in Herodotus should have done so."

But the reaction was soon to come, for his nature was too rich and sterling to be satisfied with so jejune a creed. In a chapter of the deepest psychological interest he describes the mental crisis he underwent in his twentieth year—a crisis which all but made shipwreck of his life, and which entirely altered its subsequent course.

"The time came when I awakened from this"—his Utilitarian ideal—"as from a dream. It was in the autumn of 1826. I was in a dull state of nerves, such as everybody is occasionally liable to; unsusceptible to enjoyment or pleasurable excitement; one of those moods when what is pleasure at other times becomes insipid or indifferent; the state, I should think, in which converts to Methodism usually are when smitten by their first 'conviction of sin.' In this frame of mind it occurred to me to put the question directly to myself: 'Suppose that all your objects in life were realized; that all the changes in institutions and opinions which you are looking forward to, could be completely effected at this very instant: would this be a great joy and happiness to you?' And an irrepressible self-consciousness distinctly answered 'No!' At this my heart sank within me: the whole foundation on which my life was constructed fell down. All my happiness was to have been found in the continual pursuit of this end. The end had ceased to charm, and how could there ever again be any interest in the means? I seemed to have nothing left to live for."

The Nemesis was complete and well-nigh crushing; but after a period of almost intolerable depression, described with manly simplicity and candour, Mill emerged from the struggle with a character saddened by bitter experience, but chastened to a higher ideal. Relief was first sought in art and song, which had previously found no place in his philosophy; and discarding his former bleak ideal, he reached a theory of life which, recognizing that happiness can only be found by those who seek it not, gave a freer play to the sensibilities, a wider scope to the imagination, and a quicker stimulus to culture. From this time forth Mill continually drifted more widely asunder from his father's views, from his early associates, and from his democratic aspirations; he was no longer a Utilitarian propagandist, and his political ideal tended more and more towards Socialism. The strange story of this mental crisis is interesting in more than one aspect; it proves by a direct psychological experiment that what in the language of religious experience is called "conversion" is a phenomenon which can occur beyond and without the religious sphere; and it forcibly shows that to bring up a child without religious belief is no safeguard against the mental disaster of a shipwreck of faith. Such a crisis, more or less severe, probably forms part of the experience of all men of active intelligence, and few perhaps issue from it unscathed; but to subject a mind of exceptional sensibility and fervour to a training from which most of the finer elements of culture are omitted, is to court a catastrophe which must be severe and may be irremediable.

A mental crisis and the love of a woman mark epochs in the lives of most men whose lives are worthy of permanent record, and Mill was no exception to the rule. The romance of his life has long been known in outline from the noble words in which he has more than once commemorated

the life-long friend who became his wife in his later years. But the more detailed history of his relation to Mrs. Taylor is written in the *Autobiography*, in a manner which is as dignified as it is touching. She became his friend in 1830, but they were only married in 1851, her former husband, whose friendship Mill had never forfeited, having died two years previously.

"That event having taken place in July, 1849, it was granted to me to derive from that evil my own greatest good, by adding to the partnership of thought, feeling, and writing which had long existed, a partnership of our entire existence. For seven and a half years that blessing was mine; for seven and a half only! I can say nothing which would describe, even in the faintest manner, what that loss was and is. But because I know that she would have wished it, I endeavour to make the most of what life I have left and to work on for her purposes with such diminished strength as can be derived from thoughts of her, and communion with her memory."

She inspired most of his works, and contributed largely to many of them; indeed he himself declares that during the course of their friendship and married life his chief literary function was to interpret her thoughts to the world. She died suddenly at Avignon in the autumn of 1858, and the remainder of Mill's life, when he was not called away by public duty, was spent in the neighbourhood of her tomb.

"Her memory is to me a religion, and her approbation the standard by which, summing up as it does all worthiness, I endeavour to regulate my life."

She left one daughter, Miss Helen Taylor, who still survives, the solace of his bereavement, the cherished companion of his later years, and the chosen guardian of his posthumous works. Several passages, evidently relating to Miss Taylor, have been omitted in the present edition of the *Autobiography*. We regret though we cannot but respect the modesty which has dictated these excisions.

We have dwelt only on the more prominent points of interest which the *Autobiography* presents; but it would be a mistake to suppose that they are the only points of interest in the volume. For the present however we are compelled to pass over almost without notice, the vivid sketches of Mill's friends and contemporaries, of Grote, of the Austins, of Sterling, of Maurice, and of Bentham; the account of his early associates, among whom many will be surprised to learn that men like Samuel Wilberforce and Bulwer Lytton were numbered; the instructive reflections on life and society scattered profusely throughout the volume; the description of the rigorous training to which he subjected himself in speaking, writing, and debate; and the brief sketch of his public and Parliamentary career, with which the volume concludes. All these and many other topics deserve a more detailed notice than the present; but we have said enough perhaps to justify the estimate with which we set out of the engrossing interest of the book. There are few who take it up who will set it down unread, and few will rise from its perusal without increased respect for its author and sincere regret for his loss. There are many who regarded Mill in his lifetime as a dangerous thinker and a mischievous politician; there are others, who, like the present writer, owe him so much, that, however much they may dissent from some of his teaching, they must ever regard his memory with the deepest reverence and affection. But none can read his life, so simply yet so eloquently told, without acknowledging that in spite of all failures and mistakes it was a life nobly devoted to none but noble purposes.

JAMES R. THURSFIELD.

### Notes on Scientific Work.

#### Geography.

**Antarctic Meteorology.**—The question of the weather to be expected in high Southern latitudes, about the time of the transit of

Venus, has formed the subject of a rather warm discussion in the papers during the present year, so that the appearance of some authoritative information on the meteorology of these rarely visited regions will be generally hailed as opportune.

The famous expedition to the South Polar regions in H.M.S.S. "Erebus" and "Terror" under Sir J. C. Ross in the years 1839-43, and the supplementary expedition of the (hired) sloop "Pagoda" in 1845, originated at the instance of the Royal Society, and the instructions prepared for the use of the officers, by the Committee of Physics and Meteorology, remain the most complete series of instructions on the subject in our language. Unfortunately, however, the regulations for the testing, &c., of the meteorological instruments were not thoroughly regarded, for the logs are said to contain no notice even of the numbers of the instruments on board the respective ships, nor of any of the comparisons which were to have been made at the various colonial observatories visited by the expedition. It has therefore been impossible to account for certain slight discrepancies between the barometers on board the two ships.

The only general account of the results which was published is thus described:—"Sir J. C. Ross has published, in his Narrative, abstracts from the meteorological register of the "Erebus," giving the daily maximum, minimum, and mean heights of the barometer, and of the thermometer in the shade, the mean temperature of the sea surface, prevalent wind and weather. These abstracts are, however, not altogether satisfactory, either as regards the plan upon which they have been drawn up, or the accuracy with which the data have been corrected. For instance, the direction of the wind has not been corrected for variation of the compass, although that amounts to 90° in some parts of Antarctic seas visited. Then, again, the barometer readings were reduced to 32° F. by a table which was calculated for scales on glass, and which differs at high temperatures from the table now employed for reducing observations taken from such wood-mounted barometers by '01 inch."

The Meteorological Office therefore decided to re-discuss these observations, and the results are now before us for the region south of 60° S. (*Contributions to our Knowledge of the Meteorology of the Antarctic Regions*. Published by authority of the Meteorological Committee. Stanford.) They are treated in separate areas of 2½° of latitude and 5° of longitude, according to the position of the ships from time to time. This method of publication confers an additional value on the results, for while Herschel, quoting Ross, gives a table of mean pressure from the equator southwards according to latitude simply, Buchan in 1868, giving an amended latitude pressure table, says very fairly:—"It is to be regretted that as the longitudes were not taken into account in taking those means, the geographical distribution of this anomalous depression cannot yet be accurately defined." (*Handy Book*, p. 54.) The information refers solely to the summer months, and of these the only months passed exclusively within the Antarctic regions were January and February, 1841-3. As the observations were taken hourly throughout the expedition, it has been possible to deduce the law of diurnal change for pressure and temperature (though this has not been done for the entire twenty-four daily observations), and thereby to throw important light on the course of these changes in high latitudes, and to render good service to cosmical meteorology.

The currents have been made out with as much accuracy as was possible from the observations taken in the two ships, and they show for the most part a general drift of the water from the barrier and pack ice.

Lastly, for the practical seaman in these latitudes, who will probably be in a whaler, notes as to the state of the ice and the marine fauna (monotonous enough in all conscience) have been given day by day.

The work has been executed by Mr. R. Strachan, and we may take leave of it by saying with the Office,—

"As the information is the most complete now available for the region in question, it is hoped that the investigation will prove acceptable to future Antarctic navigators."

**The Winds of Lausitz.**—Dr. Andree has contributed to the last part of *Petermann's Mittheilungen* an interesting paper on the changes in the area occupied by the Winds of Lausitz and the space over which their language extended, from the sixteenth century to the present time. This curious ethnographic island of Slavonic people lies in the midst of the great German-speaking area south-east of Berlin on the borders of Saxony, having Bautzen and Cottbus for its chief towns. As is to be expected, it is gradually and surely becoming Germanized. Almost all the Winds of Lausitz are now able to speak their own and the German language, and in the younger generation German is becoming more and more the prevailing tongue, so that the complete disappearance of the Wendish language here may be predicted. In the map illustrating his paper Dr. Andree has indicated the limits of the Wendish area in 1550 at the time of the Reformation, again in 1750, reduced to a circle within the former, and finally, at the present date, confined to a district extending from the vicinity of Bautzen to Cottbus.

### Zoology.

**Sedentary Annelids.**—MM. Humbert and Saussure have edited and published *Recherches sur la structure des Annelides Sédentaires* by Edouard Claparède. This posthumous work is the last of the writings of this very distinguished naturalist, and forms a complement to his former works on the Annelids. The many difficulties attending its publication will fully account for a two years' delay that has occurred. The Physical and Natural History Society of Geneva, which has done so much for each branch of science, was at first unable to undertake the expense of the preparation of the numerous illustrations; but the author's widow did not hesitate to make the needful sacrifice to ensure the immediate publication of so important a work, and a considerable donation enabled the Genevese Society to add this to the other memoirs by Claparède already published by them. This memoir was written in the autumn of 1870, on the eve of Claparède's departure for Naples; on his way home again in the following spring he died. A sketch of his life by Henri de Saussure and a portrait by Hébert are contained in this memoir. The biographical notice originally appeared in the *Archives de la Bibliothèque universelle de Genève*, but by the desire of the family is republished here with a few corrections. A very brief sketch of this memoir may not here be out of place. Filled with a determination to thoroughly investigate the structure of the Annelids, but living at the time at Geneva, Claparède was compelled to select an Oligochaete worm for his researches; the results of his investigations appeared in a most exhaustive and beautifully illustrated monograph: *Histologische Untersuchungen über den Regenwurm*. A sojourn by the seaside however enabled him to push his studies still further, and in the present memoir he gives us the minute anatomy of several species of Polychæte worms, together with a discussion of the question of the reciprocal affinities of the larger groups. Many structures could only be investigated in the living Annelids, others again were better seen in alcoholic specimens. The process of cutting the sections and staining them is fully described, and more than two thousand sections were made and mounted, the immense majority of the illustrations being drawn from actual sections. The instances where a drawing has been made up from a comparison of several sections is quite rare. The original drawings were of a large size, and were afterwards reduced by the pantograph. The minute structure of the Annelids is described under the following heads:—The cuticle; the hypoderm or cutaneous connective tissue; the muscular layers; the Setae; the perivisceral cavity; the circulatory system (one of the most interesting and critical chapters in this work); the digestive system; the respiratory system; and the nervous system; and the segmentary organs. The explanation of the plates occupies forty-five pages and forms a most important portion of the work. The species selected for illustration are *Spirographis spallanzanii*, *Myxicola infundibulum*, *Protula intestinum*, *Owenia fusiformis*, *Terebella flexuosa*, *Stylarioides moniliferus*, *Audouinia filigera*, *Chaetopterus varipalatus*, *Aricia foetida*, *Telepsavus costarum*, *Branchiomma vesiculosum*, and *Nerine cirratulus*. The patient investigator of these forms of life will find in this excellent work, compiled by its author with an ardour undiminished by a fast-approaching prospect of death, a model worthy of imitation. He may not be gifted, as Claparède was, with the powers of so exquisitely delineating what is seen, but this should not deter him from building on the excellent foundation which has been laid by the labours of Claparède.

**New Ganoid.**—Biologists will gratefully acknowledge the service rendered by the editor of the *Annals and Magazine of Natural History* in having translated, from the original Russian text, an account by Prof. Kessler of a remarkable fish belonging to the family of the sturgeons discovered by A. P. Fedchenko in the River Sui-dar in Turkistan. This fish differs greatly from all the known species of the genus *Acipenser* in which Russia is so rich, and belongs to the genus *Scaphirhynchus* established some time ago by Heckel as a North American sturgeon. Prof. Kessler calls the Turkistan fish *S. fedtschenkoi*; the native fishermen do not consider it to be a distinct species, but regard it as only the young of the sturgeon of the Aral Sea; they evidently do this in consequence of its normally small size, for the largest of twelve specimens examined by Prof. Kessler was but 8½ inches long, several of them being perfectly mature. Dr. Günther, in a note appended to the translation, remarks that this discovery is an additional interesting item in the series of instances by which the close affinity of the North American, North Asiatic, and European faunas is proved. He quotes as an analogous case the discovery of *Psephurus gladius* in the Yantse-kiang, and adds: "After the discovery of this species that of a *Scaphirhynchus* in Asia might have been foreseen, just as I anticipate with confidence the discovery of a Ganoid in Borneo." (*Annals and Mag. Nat. Hist.*, vol. 12 (4th ser.), p. 269.)

**New Zealand May Fly.**—In the current number of the *Entomologist's Monthly Magazine* Mr. M'Lachlan describes *Oniscigaster Wakefieldi*, a new genus and species of Ephemeridae from New Zealand. The extraordinary abdomen of this genus, if considered apart and without regard to the rest of the body, might almost be pardonably mistaken for that of some Myriapod, without the legs, or of a crustacean.

Females only have been discovered, and till we gain some knowledge of the characters of the male, the affinities must remain somewhat uncertain. Mr. Eaton has pointed out in his Monograph on the Ephemeridae that a tendency to lateral production of the terminal segments of the abdomen is shown in several genera, but the amount of expansion hitherto known is infinitesimal compared with that present in this new form. For actual affinity in this respect one must look to the aquatic stages of some forms; and if the assertion by MM. Joly that the so-called genus of branchiopod crustacea *Prosopistoma* Latreille is, as appears probable, in reality only the aquatic condition of an Ephemerid, we have in the "Binocle à queue en plumet" the nearest ally, so far as regards abdominal structure, to *O. Wakefieldi*. (*Ent. Monthly Mag.*, No. 113, p. 108).

### Physiology.

**Functions of the Brain.**—A summary of the researches made in this direction by Prof. Ferrier and communicated by him to the Bradford meeting of the British Association, appeared in the *Academy* for the 1st October. We now direct attention to the very valuable paper by Dr. Ferrier on the same subject which has just appeared in the *West Riding Lunatic Asylum Reports* for 1873, entitled "Experimental Researches in Cerebral Physiology and Pathology." Some time since Fritsch and Hitzig exposed the brain of various animals by the removal of the skull cap, and applied electrical currents to various points of the surface; they arrived at the conclusion that the anterior part of the convex surface of the cerebrum was concerned in the production of movements, that the posterior part is *not* motor, and further that there are special centres for special cerebral functions. More recently Nothnagel has attempted to ascertain the functions of the different regions by injecting small quantities of concentrated solution of chromic acid. Dr. Ferrier has pursued the same plan in his experiments as that adopted by Fritsch and Hitzig. The kind of electricity was the induced current of the secondary coil of du Bois Reymond's magneto-electrical machine excited by one cell of a Stohrer's battery. A limited portion of bone was removed with the trephine and the dura mater, which is exceedingly sensitive, cut away. The stimulation of the surface of the hemispheres by electricity causes functional hyperaemia in the parts irritated. The animals were narcotised in one way or other. The results he obtained are summed up in the following propositions:—1. The anterior portions of the cerebral hemispheres are the chief centres of voluntary motion and the active outward manifestation of intelligence.—2. The individual convolutions are separate and distinct centres; and in certain definite groups of convolutions (to some extent indicated by the researches of Fritsch and Hitzig), and in corresponding regions of non-convoluted brains, are localised the centres for the various movements of the eyelids, the face, the mouth (and tongue), the ear, the neck, the hand, foot, and tail. Striking differences corresponding with the habits of the animal are to be found in the differentiation of the centres. Thus the centres for the tail in dogs, the paw in cats, and the lips and mouth in rabbits, are highly differentiated and pronounced.—3. The action of the hemisphere is in general crossed; but certain movements of the mouth, tongue, and neck are bilaterally co-ordinated from each cerebral hemisphere.—4. The proximate causes of the different epilepsies are, as Dr. Hughlings Jackson supposes, "discharging lesions of the different centres in the cerebral hemispheres." The affection may be limited artificially to one muscle, or group of muscles, or may be made to involve all the muscles represented in the cerebral hemispheres, with foaming at the mouth, biting of the tongue, and loss of consciousness. When induced artificially in animals, the affection as a rule first invades the muscles most in voluntary use, in striking harmony with the clinical observations of Dr. Hughlings Jackson.—5. Chorea is of the same nature as epilepsy, dependent on momentary (and successive) discharging lesions of the individual cerebral centres. In this respect Dr. Hughlings Jackson's views are again experimentally confirmed.—6. The corpora striata have crossed action, and are centres for the muscles of the opposite side of the body. Powerful irritation of one causes rigid pleurosthotonus, the flexors predominating over the extensors.—7. The optic thalamus, fornix, hippocampus major, and convolutions grouped around it have no motor signification (and are probably connected with sensation).—8. The optic lobes or corpora quadrigemina, besides being concerned with vision and the movements of the iris, are centres for the extensor muscles of the head, trunk, and legs. Irritation of these centres causes rigid opisthotonus (and trismus).—9. The cerebellum is the co-ordinating centre for the muscles of the eyeball. Each separate lobule (in rabbits) is a distinct centre for special alterations of the optic axes.—10. On the integrity of these centres depends the maintenance of the equilibrium of the body.—11. Nystagmus, or oscillation of the eyeballs, is an epileptiform affection of the cerebellar veulomotorial centres.—12. These results explain many hitherto obscure symptoms of cerebral disease, and enable us to localise with greater certainty many forms of cerebral lesion.

**The Pancreatic Secretion.**—The following is a summary by Dr.

Pye-Smith, published in the *London Medical Record*, of an inaugural dissertation by Dr. Landau on the conditions of pancreatic secretion. The first series of his experiments was undertaken in order to obtain normal results so as to control the subsequent ones. The animals chosen were large dogs, which were subjected to the influence of woorara; then keeping up artificial respiration, an incision was made along the linea alba, a finger's breadth below the eusiform cartilage, long enough to expose the pylorus and draw out the duodenum and part of the pancreas. The intestine was then opened with a pair of scissors, and a glass tube passed into the orifice of the chief pancreatic duct. This was afterwards secured by bringing a fold of mucous membrane over it, and tying a ligature round both. This canula communicated with a long graduated tube, the divisions being 0.8 of a centimeter apart, and each corresponding to 0.1 of a cubic centimeter, as the object was to obtain relative and not absolute results. The second smaller duct which in the dog joins the duodenum close to the gall duct was sometimes neglected. The stoppage of pancreatic secretion, observed by Bernard after any severe operation on the abdomen, was in their experiments only slightly marked and then only temporary. The quantity secreted was rather small; the average of seven experiments was 0.2 cc., the highest being 0.65, the lowest 0.13. The second series of experiments was on the effect of atropine, Calabar bean, and nicotine on the amount of secretion. The first of these poisons has been shown by Kenchel and Heidenhain to paralyse the exciting fibres of the chorda tympani to the submaxillary glands, and thus diminish the secretion of saliva. As the result of eight experiments, Dr. Landau finds that it has no influence on the amount of pancreatic juice secreted. A similar negative conclusion was drawn from the same number of experiments after injection of calabar. Fifteen observations with nicotine proved that this alkaloid acts as a stimulant to the pancreas as well as to the salivary glands; but the author prudently declines to ascribe this without further reason to its direct action upon efferent nerves. In the course of these experiments it was ascertained that there was no constant and direct relation between the blood-pressure measured in the carotid, and the amount of secretion. In one instance the latter increased as the former fell. The third series of experiments was by direct irritation of nerves. The lingual branch of the fifth was first chosen, and its effect ascertained to be *nil*. Next the trunk of the vagus was irritated; and though the first experiment was followed by diminution of secretion, this was not the case in any subsequent one, and in some it was increased. Division of both vagi was more than once followed by increased secretion, but again was sometimes apparently without effect. Attempts to ascertain the effect of stimulating the origin of the pneumogastric did not succeed. But, by puncturing the medulla oblongata through the skull and applying the induced current, it was possible to obtain more constant though less satisfactory results. The secretion of the pancreas was increased. This, therefore, appears to be the chief positive result of these careful and laborious investigations, of which full tables are given detailing the amount of secretion observed at short and regular intervals. The fact of the central nervous system having a direct influence on the rapidity and amount of secretion of the pancreas is important, and these experiments will prepare the way for others directed to ascertain the exact position of the pancreatic centre and the efferent nerves by which its influence is conveyed.

**Nutrition of the Body.**—A long paper appears in the *Zeitschrift für Biologie*, Band ix. Heft i., by Pettenkofer and Voit, giving the conclusions they have been able to deduce concerning certain phenomena of nutrition from a long series of experiments which they performed on a dog in 1861-2 and 3. The present paper deals only with the processes of disintegration which occur in the body when varying proportions of meat and of fat are given as food. In some of these 1500 grammes of meat were given with 30, 60, 100, and 150 grammes of fat; in others 500 grm. of meat with 200 of fat; and so on. Their experiments showed that fat is absorbed in large quantities from the intestine, and that within certain limits the larger the quantity of fat in the food the more is absorbed. But when a certain proportion has been stored up in the body less is taken up from the intestine. The most important conclusion at which they have arrived is that albumen is under ordinary circumstances more easily split up in the body into simple products than fat, so that so far from fat retarding the disintegration of albumen, albumen, if taken in sufficient quantity by a carnivorous animal, delays the oxidation of the fat by splitting up into some form of oleaginous compound and other secondary products, the former of which is more easily oxidisable than ordinary fat. The fat derived from the albumen must of course be estimated as food fat, and viewing it in this light, it may be said that the consumption of fat in the body increases with the amount of albumen present in the body, or in other words, the better the general state of the nutrition of the body the more fat is disintegrated. Lastly they show that the disintegration of fat increases notably with physical exertion.

**Multiplication of Acaridae.**—In a paper recently read before the *Académie des Sciences* M. Ménézies asks, Whence come the legions of acaridae which make their appearance with such rapidity in decomposing fluids, and what becomes of them when their work of destruction is

accomplished and the matter on which they feed is reduced to the condition of a dry powder? These organisms, he remarks, have no wings to bear them from spots desolated by famine; they have not the agility of ants to enable them to undertake long migrations; they have soft integuments which form but a very slight protection against external agents and their numerous enemies; their eggs relatively large are not found in the dust of the atmosphere in company with the germs of moulds and infusory animalcules; and they do not possess, like the anguillules, rotifers, and the tardigrades, the power of reviving after desiccation. Hence they are often referred to as illustrating the correctness of their views by those who hold the doctrine of spontaneous generation. But according to M. Mégnin, what happens in a colony of tyroglyphs when the privation of food seems to promise them speedy destruction, is that all adult and aged individuals as well as the young hexapod larvae die, but the young and the octopodous nymphæ are preserved. These undergo a change of form and become clothed with a cuirass which completely disguises but at the same time protects them; moreover they acquire a sucker by which they are enabled to adhere firmly to any passing object such as flies, spiders, myriapods, and insects of all kinds, or even to quadrupeds, by which they are transported to places they could never reach by their own unaided efforts. If they find a suitable locality, as on a young mushroom or a mass of decomposing substance, the little acaridan quits its temporary host and its hypopial form and reassumes the original tyroglyphic one. Under the influence of abundant food it rapidly enlarges, becomes a sexual adult, and in forty-eight hours a new colony appears.

Not long after the death of Gustav Rose the science of mineralogy experiences another great loss by the death of the venerable Prof. Breithaupt of Freiberg, which took place on the 22nd of last month. Johann August Friedrich Breithaupt was born at Probstzella, near Saalfeld, in May, 1791, and so far back as 1813 already held an appointment in the institution, his connection with which has now after a lapse of sixty years been severed by his death. First he was appointed Edelstein-Inspector and Hilfslehrer in the Bergacademie, and in 1827 was created professor of mineralogy in that school. His first work was a "Kurze Charakteristik" of the mineral system, which appeared in 1820, followed by a "Vollständige Charakteristik" that passed through two editions. His chief production however was the "Handbook of Mineralogy," which appeared in three volumes between the years 1836 and 1847. His memoirs on minerals written from time to time during more than half a century, from the first, that appeared in 1855 on genuine crystals, to the one dictated with difficulty through failing sight and increasing infirmity and published in the *Journal für praktische Chemie*, at the commencement of the present year, contain vast stores of results of the highest value for the advancement of mineralogical science.

The publishers of *Poggendorf's Annalen* will shortly issue a Jubelband of the *Annalen* illustrated with photographic likenesses of many of the chief contributors.

### Philology.

Sathas' *Medieval Greek Library*. [Μεσαιωνική Βιβλιοθήκη, ἐπιστολαὶ Κ. Ν. Σάθα.] 3 vols. Venice. 1872-3.

We have repeatedly drawn attention in the pages of the *Academy* to the interesting publications at present being issued under the superintendence of the indefatigable historian C. Sathas, whose *Μεσαιωνική Βιβλιοθήκη*, three volumes of which we have now before us, constitutes a most important addition to the *Corpus scriptorum historiae Byzantinae*. M. Sathas possesses a strength of purpose and power of execution truly astonishing, and even if his published works were less valuable than they actually are, we should still find ourselves compelled to praise the honest zeal with which he endeavours to throw new light upon the darkest periods of the history of his country, viz. the later years of the Byzantine Empire and the Turkish dominion. The history of the Greek nation with respect to national and literary aims has been illustrated by M. Sathas in his two works *Νεοελληνική Φιλολογία* and *Τουρκοκρατούμενη Ἑλλάς*, which are supplemented by his *Ἑλληνικά Ἀνέκδοτα* (2 vols.) and his treatises *Ἱστορία τοῦ ζητήματος τῆς νεοελληνικῆς γλώσσης* (reviewed in

the *Academy*, vol. ii, p. 544 sqq.) and the Βιογραφικὸν Σχέδιον περὶ τοῦ πατριάρχου Ἱερεμίου Β'. The three volumes of the Μεσαιωνικὴ Βιβλιοθήκη contain a large number of texts previously inedited and bearing upon the history of the Greek nation in various ways, with elaborate and learned introductions by the editor. Our space forbids us to follow him through all three volumes, but we will briefly sketch the contents of this great work in the hope of inducing the reader to enter upon a further study of it for himself.

The first volume is entirely devoted to Byzantine writers (Michael Attaliates, Nicetas Choniates, and Theodore Choniates), and contains also a series of χρυσόβουλλοι λόγοι of the family of the Palaeologi and "Cral" Stephen of Serbia, who likewise uses the Greek language. At the end of the volume we find a metrical narration of the last days of the Byzantine Empire by a certain Ἱέραξ, in 734 lines. On this we would offer a few corrections: v. 87 ἐρᾶσαι. 104 ὦ. 111 συντρίψαι. 193 we do not understand ἀμφίβιον; it should no doubt be ἀντίβιον "his adversary." 207 χαλεπωτάτη. 248 is not complete; but it is difficult to supply the defect. 295 ἦ instead of ἡ. 415 οὐχ. 422 ὑπθρίτιδι. 485 κεκυκλωμένην. 558 should probably be read ὡς δὲ ἱαπερᾶν. 592 βρυχώμενος. 630 αὐτοῦ, not ἐαυτοῦ. 657 ἀπὸ τοῦ Χριστοῦ. 717 the words τῶν ἐνδόσῃ appear to be corrupt. Then follow a catalogue of the libraries of Mount Athos, and a very interesting catalogue of the MSS. of the Monastery of the Holy Sepulchre (μετόχιον τοῦ παναγίου τάφου) at Constantinople.

Following the order of publication we now proceed to the third volume, which contains various writers illustrating the history of Greece under Turkish dominion, chiefly two historical works by Καϊσάριος Δαπόντες (in modern Greek), and by Sergios Makraeos (in Byzantine Greek). Of special interest is the short work on learned Greeks by Demetrios Prokopios, pp. 480-503, written a. 1721. This is a very important volume for those who are willing to convince themselves of the abundance of intellectual life still extant in Greece even in the worst epoch of her history.

We now pass to the second volume, the publication of which has been delayed until quite recently owing to the engravings required for the learned and exhaustive treatise on mediæval Cyprian coins by M. Paulos Lambros, one of the first authorities in this department of study. This volume contains two chronicles of the mediæval kingdom of Cyprus, by Leontios Machaeras and George Bustronios, both written in the Cyprian dialect, and valuable in respect both of their historical and their linguistic interest. The dialect of the island of Cyprus has received much attention in an excellent work of M. A. Sakellarios, professor at the Piræus (τὰ Κυπριακά· τόμος τρίτος, Ἀθήνησι, 1868), who has also given a very full collection of Cyprian songs, fairy-tales, and proverbs, together with a valuable glossary of Cyprian words. M. Sathas has likewise added a very complete glossary to his edition of the two mediæval chronographers, but we could have wished that he had precisely indicated the various passages in which the words and expressions explained by him occur, as the late Professor Mavrophrydes has done in his excellent glossary on his Ἐκλογή μνημείων τῆς νεωτέρας ἑλληνικῆς γλώσσης. We will quote an instance to show how very useful and important such accurate references would be. In M. Sathas' glossary we find, p. 598 b, the explanation ἀναγιόδμαι, ἀνδρῶμαι, ἀνατρέφομαι, and we have indeed more than once met with this word in his chronicles. The word is the same as ἀναγιώνω explained by Sakellarios, p. 232, who justly derives it from ἀνά and γιός, the digammated form of γίος, so that the meaning would be ὡς υἱὸν ἀνατρέφω. (In his introduction, p. λ', Sakellarios mentions ἀγιώνω as a digammated word, but he does not give it in his glossary.) The very same word

occurs in the poem on Apollonios first published in my *Mediæval Greek Texts*, v. 427, καλῶς νὰ τὴν φυλάξουσιν, νὰ τὴν ἀναγιώσουν—where, however, my new edition will certainly read ἀναγιώσσουν. I may, by the way, observe that M. Sathas should have mentioned this poem among the earliest compositions in the Cyprian dialect, as not only ἀναγιώνω, but also other expressions and forms point to this; nothing, however, being a stronger proof than the preposition ἀκ, instead of ἐκ, which the renewed collation of the Paris MS. by my learned friend E. Legrand has brought to light in three places. M. Sathas is wrong in explaining ἀκ = ἀπό (p. 598). The preposition known in ancient Greek as ἐξ and ἐκ corresponds to the Sanskrit *vah-is* "outside," which in itself presupposes an earlier form *vaghis*. In the *Trans. of the Philological Society of 1867*, p. 86, I had called attention to another modern form of the preposition, ὄχ, which I then maintained to be older than ἐκ, and I have now the satisfaction of adding to it ἀκ, a form decidedly nearer to *vahis* than the classical ἐκ. M. Sathas himself has ἀξ, ἐξ, p. 599. But to return to ἀναγιώνω, it may be suspected that another form mentioned in M. Sathas' glossary, p. 599, ἀναγνώνομαι, is merely a corruption (or even a misprint) instead of another spelling, ἀναγνώνομαι. This might have been settled at once, had M. Sathas indicated the passage in which his supposed ἀναγνώνομαι occurs.

Even such a cursory disquisition as that which I have just given may probably have convinced the philologist of the linguistic importance of the Cyprian dialect. Let us mention a few more words to illustrate the tenacity with which this dialect seems to have clung to early traditions. In a recent notice of Morosi's *Studies on Italian Greek* we quoted the word ἀρμυσία "marriage;" in Cyprian Greek we find ἀρμυσία and the verbs ἀρμάζω and ὀρμάζω used in the same sense. In the same way πολεμῶ or πολομῶ frequently bears the simple sense of ἐνεργῶ. But many scholars will be pleased to hear that the Homeric λαοί (corresponding to the German *Leute*) still survive in Cyprus, where λᾶς τῶν ἀρμάτων is a common appellation for ὀπλίται. See also Sakellarios, p. 327.

We have been much interested in comparing the songs given by Sakellarios, pp. 39-46, with the narration of the same event in the chronicles of Machaeras, pp. 164-176 (see also Sathas' Prol. p. 45). A passage of the latter may serve to give the reader an idea of the general character of this dialect. ὁ ῥήγας ἐγραψεν τῇς ῥήγαινας πολλὰ θυμωμένα· ἔμαθα τὸ κακὸν τὸ ἐποίησες τῇς ἡγαπημένης μας κυρᾷ Τζουάναν Λαλεμᾷ· ἐπὶ τοῦτον τασσόμαι σου, ὅτι ἀνισῶς καὶ ἔλθω εἰς τὴν Κύπρον με καταβροδίον βοηθῶντος θεοῦ, θέλω σοῦ ποίσειν τόσο κακὸν ὅπου νὰ τρομάξουν πολλοί· διὰ τοῦτον πρὶ νὰ ἔλθω ποῖσε τὸ χειρότερον τὸ νὰ μπορίσης. "The king wrote to the queen, 'I have heard of the wrong you have done my beloved lady Jeanne Lalema; therefore I promise you, that, if perchance I shall fortunately come back to Cyprus with the help of God, I shall do you so much harm that many will be frightened; therefore before I come do the worst you can.'" In these words καταβροδίον represents the modern κατευόδιον. We may notice the form ἐποίησες = ἐποίησας or πεποίησας, and the future θέλω ποίσειν, in which the infinitive is still retained unchanged.

M. Sathas' Prolegomena will be read with interest by all students of mediæval Greek history. But we cannot help thinking it very desirable that a competent scholar should publish in some historical journal a résumé of the historical information contained in this work, for we are afraid that but very few historians possess either a sufficient knowledge of Greek or patience enough to find their way through these volumes. We can here merely draw attention to M. Sathas' works, which deserve the highest praise; but in the interest of historical students we could wish that the editor had added a Latin or French translation of the Greek originals published

by him. This would no doubt have increased the bulk of his volumes, but would also have facilitated their circulation. In conclusion we may express the hope that M. Sathas will long retain the remarkable vigour and freshness of mind and body which alone enable him to carry out his very laborious and patriotic undertakings.

W. WAGNER.

Essai d'une Classification du Syllabaire Assyrien. Par E. de Chossat. Paris : Maisonneuve & C<sup>ie</sup>. 1873.

WE welcome the appearance of another work to facilitate an acquaintance with the Assyrian Syllabary. Ménant's book is too cumbrous and imperfect; Schrader only professes to reproduce the native syllabaries already lithographed, with the addition of the most necessary characters; Norris's list of signs is intended merely for those who wish to use his Dictionary; and Smith's Syllabary gives only the Assyrian forms of the characters, while many of their values are omitted, and phonetic and ideographic powers are mixed together. A new work on the subject, therefore, was greatly needed. But M. de Chossat's Essay is extremely disappointing. His method of arrangement, though unscientific, may be found practically useful, in spite of the separation of variant forms of the same character necessitated by it; but it seems to me that he has rushed into print with a very meagre knowledge indeed of Assyrian. The inscription of Samas-Rimmon, or, as he calls him, Samsi-hu, is the only one which he seems to have looked at for himself: everything else is derived from MM. Oppert and Ménant. He states in his Preface that "the works he has chiefly used for his *brochure* are those of MM. Ménant, Oppert, and Lenormant": but there are few traces of the last-named *savan* to be met with. It would have been well had Lenormant's *Etudes Accadiennes* been consulted; and better had the author referred to Schrader's monograph on the Decipherment of the Inscriptions, and Smith's Syllabary with the supplementary values given in the Appendix of my *Assyrian Grammar*.

A slight perusal of the book will justify the charge I have brought against it. There is not a page which does not require corrections and additions. To say nothing of omitted characters, some of them common enough in the tablets, there are few signs which ought not to have additional phonetic or ideographic values attached to them. Taking the first page, for instance, we miss in the first character the value of *kharrā* (= *samu* "heaven"), while the ordinary meanings of "sitting" (*asābu*), "seizing" (*tsabātu*), and "channel" (*nakbu*) which belong to the second are all wanting. These omissions, however, might be forgiven, considering the extent of the Assyrian syllabary; but what shall we say of a writer who does not know the characters he undertakes to explain? Thus on p. 5 *sal* and *lim* or *si* are confused together, *si* being further read as *su*, thus falsifying a verbal form; in p. 15 *ba* and *cu* are similarly confounded; and *muk*, *kak*, and *ni* on p. 16. On p. 35 *lim-nu* ("destructive") is read as a single compound ideograph: *takh* is given as *hapik* (p. 84); 90 as "eighty" (p. 23); and the character rightly translated "altar" nowhere has its usual phonetic values of *bar* or *sar*, the latter value being ascribed to a different character in p. 89. The mistakes of modern copyists and printers are attributed to the authors of the inscriptions, and we have imperfect copies given as variant forms of a character, as in the case of *ri* (p. 17), or *niv* (p. 24), where, by the way, two distinct characters (*niv* and *is*) are further confused together, and the first translated "world" instead of "high."

But M. de Chossat's ignorance of the inscriptions is

shown in another way. He tells us that *li* signifies "month" or "moon" (p. 13). Had he referred to the native syllabaries, he would have found that when the character had this meaning, it was sounded (in Accadian) *ab*. So, again, the variant reading *tir-tsi* proves that we must read *tar-tsi* and not *khats-tsi* "in the presence of" (p. 9). *Kas*, moreover (p. 17), never had the value of *kis*, or the signification of "multitude," but denoted "two." Similarly *ti* or *sil* (p. 23) was "life" not "serpent"; so was *tir*, which M. de Chossat persistently renders "langue"; and *sap* (p. 62) was not *sipir*, and *mā* (= *elippu* "ship") not *sik* (p. 28). It is the same sign as that which is erroneously given as *dir* (p. 39), the true representative of *dir* being, by way of compensation, described as of "unknown assimilation" and a reference given to Samas-Rimmon's inscription, as though it were not met with elsewhere. The same page (39) is disfigured by an extraordinary confusion of the two characters *dan* and *tak*.

After this, it is not surprising that M. de Chossat is unable to proceed as soon as his modern guides fail him. The common character which is said to be "cited by M. Ménant as of unknown value" (p. 45) has the phonetic powers of *dur* and *zicum* and the ideographic powers of *apru* ("running water") and *samu* ("heaven"), and is identical with the "completely unknown" sign of p. 31, which occurs in a royal name, no longer read by M. Lenormant, be it observed, as *Urkhammu*. A syllabary renders *gistin* (p. 34) by *caranu*, and the word is frequently found with the meaning of "vine." The mysterious letter which puzzles the author in p. 71 is *kit* or *ge*, the Accadian postposition; and the "unknown" sign of p. 33 is *mu* or *sum* (identical with that at the top of p. 18) and is not found only in Samas-Rimmon's inscription. But I cannot understand how the ordinary prefix of "limb" can be described as of "unknown signification" (p. 58), or how *silulu* "the south" (p. 51) can have the same note attached to it. Indeed the latter monogram fares badly: in p. 58 it is given as "north," and *sur*, "the north" as "south," the additional information being vouchsafed that the one is literally "(plaga) sinistra" and the other "(plaga) dextra"! The most amusing instance of the blind acquiescence with which the author follows his guides is when he prints the two common characters *ik* (61) and *kan* (p. 80) in capitals, and refers to the "Inscription of Khammurabi," as if they occurred nowhere else, simply because M. Ménant, in his excellent monograph on that inscription, has so transliterated them because found in a compound ideograph the Assyrian reading of which was *khigallu* "canal." I do not know whence he derived his idea of transliterating *eilu* "a field" by *kharran* (it ought to be *kharranu*) and rendering it "rock," "inscription" (p. 11); but M. Oppert will not thank him for being made answerable for the astounding assertion that the Accadian *a-ab-ba* "the sea" was the Assyrian *sadu* "mountain" (p. 10), nor do I think that that scholar will maintain his former opinion that *mat kurra* "the land of the East" or "Elam" was "Shinar or Mesopotamia." M. de Chossat's knowledge of Assyrian Grammar is as imperfect as his knowledge of the Syllabary, and this makes the sprinkling of Hebrew and Ethiopic in his book appear somewhat affected. Thus he asserts that *su* is "the equivalent" of *su* "as the suffixed pers. pron. of the third pers." (p. 37), whereas this can only happen after *s'* or *t'*, and in p. 88 the enclitic conjunction *va* is taken to be a part of the verb. It is to be hoped that he will devote more time to the study of the inscriptions before he again writes upon the subject, and that his next publication will not be printed in autograph. A protest ought really to be raised against this detestable practice which is coming into vogue among French

authors. Even with a clear handwriting, autograph is trying to both eyes and patience; and M. de Chossat's handwriting is not always clear. A book of reference, moreover, is the last thing in the world to be printed in this manner; and however good the Syllabary might have been, most of its value and usefulness would have been destroyed by the form in which it has appeared. It is not desirable to perpetuate such clerical errors as *nahbar* for *nabkhar* (p. 9), *num* for *nun* (p. 30), *a-la-sa* for *al-la-sa* (p. 12), *kuptur* for *cabtur* (p. 88), or *naham* for *nakam* (p. 92).

A. H. SAYCE.

#### THE ANNALS OF THE BAMBOO BOOKS.

IN *Professorial Dissertations of Univ. Coll.* (1872-3) there is an interesting paper by Prof. Holt on Dr. Legge's translation of the Chinese work known as the Annals of the Bamboo Books. This ancient Record is said to have been discovered in the tomb of Seang, King of Wei, who died B.C. 295, and purports to contain among other documents an authentic History of the Empire from the time of Hwang-te (2697 B.C.) down to the death of Seang. The practice of fastening a claim to great antiquity on books by no means entitled to that distinction, by announcing them as treasure-trove from the walls of old buildings or the tombs of ancient monarchs has not been uncommon in China, and the history therefore of the discovery of the Bamboo Books must be received with caution, since it is impossible that we can have any direct evidence in support of it. The opinions of native scholars have been much divided on the subject, but as Dr. Legge points out, Too Yew, an eminent contemporaneous writer, mentions that his attention was drawn to the Annals shortly after they were reported to have been found; they received also due recognition in the Imperial Catalogues of the Suy and Tang Dynasties, and they have found numerous editors in all ages down to the present time. If then we take their authenticity for granted, they not only form, as Mr. Holt remarks, "the most ancient record of Chinese History which has been handed down," but they also contain much of great historical interest as showing the height of civilisation and power which the Chinese of that distant day had reached. For instance, during the period B.C. 2697—B.C. 1000 we read "of caps and robes, and of chariots or carriages drawn by horses. Sacrifices are mentioned; the heavenly bodies are delineated; calendaric calculations are invented, and natural phenomena observed; music is composed, and dancing instituted; architecture is studied, and temples and palaces are erected; the Empire is divided in Provinces; dykes are constructed to restrain the overflowing of the great rivers; orders of nobility, from princes to barons, are established. We read of standing armies, of a minister of works, of a college, and a code of punishments; while such is the fame of the Empire that representatives from a distance as great as India come to pay homage and bear tribute."

It is also interesting to observe that supernatural phenomena are frequently associated with the births and deaths of the earliest Emperors, and of the rise and fall of the successive Dynasties. In the majority of instances particular stars, sometimes associated with rainbows, were seen announcing the entry into the world of the first rulers of China. "As regards the stars," Mr. Holt remarks, "we find that amongst her other titles, Ishtar was called the Queen of the Stars, and Ishtar was one of the names given to the Celestial Virgin Mother by the Assyrians, being also identical with Astarte, Venus, Ceres, Juno, the Moon, and other names too numerous to mention here, but all representing the idea of maternity. Nor is it a fact of common interest to know that to this very day the Virgin Mary is honoured in the Basque Provinces under the name of Astarte." When at the age of a hundred the Emperor Hwang-te finished his course on earth, we are told that the ground was rent and he was taken up to Heaven on a Dragon,—a legend which may possibly have given rise to the general custom in China at the present day of never speaking of the decease of an Emperor as of his death but as of his translation to Heaven. Mr. Holt has done good service by introducing the subject of these records. There is much in the ancient Annals of China to repay careful study, and the time has now fully arrived when the attention of Sinologists should be directed to placing them within the reach of the European public. ROBERT K. DOUGLAS.

#### Notes and Intelligence.

We learn with satisfaction that M. Adolphe Neubauer, late of Paris, who has for some years past been engaged in cataloguing the Hebrew Collection in the Bodleian Library, has been nominated to the office of sub-librarian in that institution: and that this nomination was approved by Convocation on Thursday last. M. Neubauer is already well known as one of the first of Talmudical scholars; and we trust that his new appointment may give him leisure to finish his valuable work on the Talmud, of which the first part, "*La Géographie du Talmud*," was

"crowned" by the French Academy. Besides innumerable smaller works in various languages, M. Neubauer is bringing out for the Delegates of the Clarendon Press the important dictionary of Abulwalid from the Bodleian MS. The University of Oxford has already shown its sense of the value of its new sub-librarian's services by conferring upon him the degree of Master of Arts by diploma, an honour which has only been conferred on two other persons within recent times, Dr. Johnson and Mr. Robert Browning.

We are glad to learn that M. Antoine d'Abbadie, the well-known Abyssinian traveller, is preparing for publication a Dictionary of the Amariñña language (usually, but incorrectly, called Amharic). The best dictionary of the language now available is Isenberg's; and scarcely a page of this is free from blunders and omissions.

Egypt is generally regarded as the original home of the beast-fable, which is found in papyri as old as the XVIIIth Dynasty, although Mr. Mahaffy has suggested that, like animal-worship, it was really introduced into Egypt from the Nigritian aborigines. Mr. G. Smith, however, has found three fragments of a collection of beast-fables which belonged to a certain Assyrian city. One of these represents a dialogue between the horse and the ox, another between the eagle and the sun. They might have been borrowed from the Egyptians; but this is not very likely; and we should rather suppose that the fable was the independent creation of more than one despotically-ruled people.

The meetings of the Philological Society will begin again on the 7th of next month, when four short papers will be read: 1. on *Cursor Mundi* by Dr. Morris; 2. on the *Prioress's Nun-Chaplain in Chaucer* by Mr. Furnivall; 3. on the name *Beowulf* by Mr. Sweet; 4. on the *Creole Language* by Mr. Thomas. Among the later papers promised may be mentioned *On Comparative Dialectical Phonology* by the President, Mr. Ellis; three papers on *The History of English Sounds* by Mr. Sweet; and an important one by Mr. Murray on *The Classification of the Early English Dialects*. Most of the papers are on points connected either with English philology or phonetics. The only one which deals with a classical subject is Prof. Key's paper *Corrections of the Text of Terence*. Oriental philology is only represented by a paper by Prof. Rieu *On Persian and its Affinities*. The Programme is, however, not yet entirely filled up.

#### Contents of the Journals.

*Zeitschrift für vergleichende Sprachforschung*, xxi. 4, 5.—Fr. Haefelin: Treatises on the Romance dialects of South Western Switzerland. [The first of a series, beginning with the dialect of Neuchâtel: contains a full account of the vowel-system in its relation to Latin.]—Leo Meyer: On "Vocalsteigerung" especially in the inflexion of the Verb. [Endeavours to limit the cases of *Vridhii* in Sanscrit, and to show that it is not a further stage of Guna but a distinct and specifically Indian product.]—The same: *ἔκατος—Fekatos*. [As against *jekatos* or *dekatos*, the former being proposed by Benfey and Curtius, the latter by Ahrens. The traces of *j* and initial *σ* in Homer are more than doubtful, and *Fekatos* is now found on the Locrian inscription discussed by Allen in *Curt. Stud.* iii. 205 ff.]—A. Fick: Contributions to etymology. [Old Irish words—*lár*, *ithemair* *lanmair*, *aig*, *cnam*, *ciad*, *folcain*.]—G. Gerland reviews Gerber's *Die Sprache als Kunst*.—B. Delbrück reviews Ludwig's *Agglutination oder Adaptation?* [unfavourably.]—Ernst Windisch: On Fick's Comparative Dictionary of the Indo-Germanic Languages. [Three articles: (1) criticising the plan, especially the arrangement of words under seven hypothetical "Grundsprachen," which the reviewer thinks inadvisable in the present state of knowledge; (2) on the roots *ank*, *nak*, and on the syllable *na* inserted in the Sanscrit conjugation; (3) Celtic etymologies, chiefly words meaning "to see," a sort of supplement to the Celtic part which Windisch contributes to the new edition of Curtius' *Grundzüge*.]—H. Schuchardt: Romance Philology. [Reviews of recent articles in other periodicals.]—A. Fick: Contributions to etymology. [On (1) *invitus*, *invitare*, and (2) *Ποσειδᾶς*, Poseidon, and the Vedic *idaspati*, "Lord of swelling."]—K. G. Andresen: Old German *ht* and *hr* retained in Proper Names as *gl*, *kl*, and *gr*.—Wenzel Burda: On the etymology of *Παπάρια*.—Leo Meyer, *Edw—Edw* from *se Fdw*.—G. Gerland: Review of Kleemann's *Glossae Creticae*. [Careful and intelligent.]—Ernst Kuhn: Review of Joh. Schmidt's paper, *Die Verwandtschaftsverhältnisse der indogermanischen Sprachen*. [A remarkable attempt to prove continuous transition as against the theory of "Grundsprachen," especially of distinct Aryan and European "Grundsprachen."]

*Zeitschrift für vergleichende Sprachforschung*, xxii. 1.—Gustav Meyer: The Dvandva compounds in Greek and Latin. [Admits a very few late words to be so, e.g. *νυχθημερον*.]—Leo Meyer: *ἰνέομαι* and connexion. [Shows that the root means "to reach," not "to come," and connects it with Sanscr. *acnōmi*.]—The same: *θεωπέω*. [From the root *praç* "to ask."]  
—The same: On some German pronominal formations.—H. Schuchardt: Review of Giuseppe de Rada, *Grammatica della lingua Albanese*. [Treats of the Albanian dialect spoken in Calabria as the Albanian *kar' êxoxh*. The reviewer points out much that

is defective in the work.]—H. Weber: Lithuanian *ang* = Germ. *ang*.—Martin Arnesen: Norwegian names of places testifying to ancient games.—The same: Names in *bern* in Frisian and North German.—A. Fick: Contributions to etymology. [Ecclesiastical Slavonic *pasit* and Old Norse *spak-r*: *þpi* "early," Goth. *air* "early;" Zend *ajare* "day."]

••• BOOKS FOR REVIEW may be sent to the care of Messrs. WILLIAMS and NORGATE, or to their Agents on the Continent.

Now in course of publication, in 8vo.

Dr. Kalisch's Historical and Critical Commentary on the Old Testament, with a New Translation:—

- GENESIS, Larger or Student's Edition, with the Hebrew Text, full References, Philological Notes, and a series of Treatises, price 18s. English or Abridged Edition, adapted for general readers, price 12s.
- EXODUS, Larger Edition, price 15s. English or Abridged Edition, price 12s.
- LEVITICUS, PART I. Larger Edition, price 15s. English Edition, price 8s.
- LEVITICUS, PART II. Larger Edition, price 15s. English Edition, price 8s.

••• Each volume may be had separately.

"With patient and untiring industry the Author has traversed wide fields of knowledge, where the views of writers often are conflicting, vague, and erroneous; his acuteness keeps pace with the range of his knowledge; and a philo-sophical insight marks the course of his investigations."—*Athenæum*.

London: LONGMANS, GREEN, and Co., Paternoster Row.

Just published, in crown 8vo., price 7s. 6d. cloth.

Kant's Theory of Ethics, or Practical Philosophy: comprising I. Fundamental Principles of the Metaphysics of Morals; II. Dialectic and Methodology of Practical Reason; III. On the Radical Evil in Human Nature. Translated by the Rev. T. K. ABBOTT, M.A., Fellow and Tutor of Trinity College, Dublin; sometime Professor of Moral Philosophy in the University.

By the Translator, in 8vo., price 5s. 6d.

SIGHT and TOUCH; an Attempt to Disprove the received (or Berkeleyian) Theory of Vision.

"A most important contribution to the scientific treatment of the human mind."—*Saturday Review*.

"We know nothing more interesting than the careful revision . . . of the whole body of evidence derivable from recorded cases of persons born blind, and cured after coming to adult age; a revision which was greatly needed."—*Lancet*.

"An important contribution to the evidence that the perceptions of sense are not products of the organs, nor of a physico-chemical process."—FICHTE and ULRICH'S *Zeitschrift für Philosophie*.

London: LONGMANS, GREEN, and Co., Paternoster Row.

By ROBERT FERGUSON, 8vo, price 14s.

The Teutonic Name-System, applied to the Family Names of France, England, and Germany.

"The interesting and comprehensive problem the author himself thus sets before us. His object is to bring into connection the family names of France, England, and Germany, so far as the German element is concerned, as members of one common family, and to arrange them on a definite system, in accordance with the nomenclature of the old Germans. He holds the opinion that a large proportion of French as well as of English names are of Teutonic origin, which, heretofore, has not been assumed to be the case to the same extent. . . . All this he has worked out with independent judgment, and, it must be admitted, with general correctness; he has, moreover, made some new suggestions, which commend themselves, for the explanation of French and English names."—*Professor Dietrich, in the Jahrbuch für Romanische und Englische Literatur*.

### General Literature.

**Traditions and Hearthside Stories of West Cornwall.** By William Bottrell. With Illustrations by Mr. Joseph Blight. Second Series. Penzance: Printed for the Author by Beare & Son.

THE first series of this collection, published in 1870, introduced Mr. Bottrell to us at the same time a good story-teller and a careful and accurate student of his native county, so that it may be hoped that the continuation of his labour of love will meet with the same recognition as that bestowed upon the first part, and this not only on account of the generally attractive substance of the separate tales, but also because of the clear and vivid pictures which they give us of the country and the people whence they are taken. Still the profit to be gathered for the comparative study of folklore is less considerable than might have been expected, partly on account of the character of the matter narrated, which sometimes borders closely upon real events and sometimes actually contains them. Thus it happened that the first series contained little that could be connected with a wider circle of popular conceptions; as for instance the history of *The old wandering Droll-teller of the Lizard and his story of the Mermaid and the Man of Cury*, and the one of *Nancy Trenoweth, the fair daughter of the Miller of Alsia*, part ii., the conclusion of which, pp. 201-3, belongs to the widely spread legendary cycle made familiar by Bürger's *Lenore*. In this respect, however, Mr. Bottrell's new collection is somewhat richer than its predecessor. Thus the substance of the first paper, *Duffy and the Devil, An old Christmas Play*, is taken, as the author has forgotten to remark, from two well-known folk-tales, and in such a way that the first part corresponds to *Rumpelstiltschen*, Grimm No. 55, and the remainder from p. 23 onwards, to Grimm No. 14, *Die Spinnerinn*, thus reversing the connection that we find in the French nursery tale *Ridin Ridon*, where the introduction agrees with the latter and the conclusion with the former of the two German tales. Upon these see Köhler's Notes on Laura Gonzenbach's *Sicilianische Märchen*, No. 84, "Die Geschichte vom Lignu di Scupa," and Henderson's *Notes on the Folklore of the Northern Counties of England*, pp. 221-6, with Mr. Baring Gould's remarks, the references in which, minus the misprints, are all, without exception, taken from Grimm. It is interesting in other respects to find a subject of the kind worked up into a

Christmas play, a circumstance of which, as I believe, but few examples are to be met with, and which alone would give no slight interest to Mr. Bottrell's work. The *West Country Droll, Tom of Chyannor, the Tin-Streamer* (p. 77 sqq.), relates how Tom is offered by his master, instead of his three years' wages, four pieces of wisdom; he accepts the offer and fares well by following the advice given. The first counsel is: "Take care never to lodge in a house where an old man is married to a young woman;" the second: "Take care never to leave an old road for a new one;" the third: "Never swear to anybody or thing seen through glass;" the fourth: "Be thrashed twice before consent once." This tale, another Cornish version of which, translated from Lhuyd's *Archæologia Britannica*, p. 251, was given in *Blackwood's Magazine*, May, 1818, is to be met with also in Tyrol, the South of France, Sicily, and Spain; see Gonzenbach's *Sicilian. Märchen*, No. 81, "Die Geschichte von den drei guten Rathschlägen," with the notes; also Gradi, *Pasqua di Ceppo*, Turin, 1870, p. 83: "I tre consigli del Dottore"; but especially *Gesta Romanorum*, cap. 103: "De omnibus rebus cum consensu et providentia semper agendis;" for this is the oldest version known at present where the three counsels (sapientias) are as follows; the first: "*Quicquid agas, prudenter agas, et respice finem*;" the second: "*Numquam viam publicam dimittas propter semitam*;" the third: "*Numquam hospicium ad manendum de nocte in domo alicujus accipias, ubi dominus domus est senex et uxor juvencula*." I have already pointed out (Ebert's *Jahrbuch für Roman. und Englische Liter.* iii. 154) that the first piece of advice is derived from the moral of Aesop's fable "The Fox and the Grapes" (Kor. 4. Halm 45). In Mr. Bottrell's version of the tale, Tom receives in addition as a present from his master's wife a small stone "of great virtue; it will preserve any woman that weareth it from much trouble if she but keepeth it in her mouth, with her lips closed, that it may not drop out when her husband or any other contendeth with her;" and the virtue of this stone is proved by experience. This also is the version of a well-known anecdote told of Saint Augustine's mother, Saint Monica, who had a very irritable husband, and to avoid disputes, whenever he reproached her, used to take water into her mouth and keep it there till his passion was spent. Hence too the French proverb: "Il faut faire comme Ste. Monique, mettre de l'eau dans la bouche." This original

version, which I have also met with in Italian works, is better than the Cornish one, for the stone might be lost, while water is to be found everywhere.

The story of the Piskey, the industrious household spirit who has new clothes given him instead of his old rags, and thereupon leaves the house for ever, exclaiming: "Piskey fine and Piskey gay,—Piskey now will run away" (p. 168 sq.), is to be met with, not only in other parts of England,—as in Devonshire, where the Pixies exclaim: "Now the Pixies' work is done,—We take our clothes and off we run" (*Athenaeum*, 1846, p. 1092), and in Scotland, where the last Brownie known in Ettrick Forest resided in Bodsbeck and exercised his functions undisturbed till the scrupulous devotion of an old lady induced her to hire him away, as it was termed, by placing in his haunt a porringer of milk and a piece of money. After receiving this hint to depart, he was heard the whole night to howl and cry, "Farewell to bonny Bodsbeck!" which he was compelled to abandon for ever (Walter Scott, *Introd. to Minstrelsy*);—it is also at home in Germany, see Adalb. Kuhn, *Westphäl. Sagen* i. 157-8, No. 163. No one will be surprised at such a wide dissemination of legends and other narratives, as innumerable similar examples lie before us; but I cannot refrain from adding one more instance, suggested by Bottrell's mention (p. 274) of William Noy, the Attorney General of Charles I., who belonged to a Cornish family. It is related of him that his rise originated in a case which is very well known, that of the *three graziers*. At a country fair they had left their money with their hostess while they went to transact their business. A short time after, one of them returned, and under pretence that they had occasion for the whole money, received it from the hostess and made his escape with it. The other two sued the woman for delivering that which she had received from the three, before the three came and demanded it. The cause was tried and a verdict found against the defendant. Mr. Noy, who was then making his first appearance at the bar, requested to be feed by the woman, saying that he thought he could still bring her off. He then moved an arrest of judgment, stated that he was retained by the defendant, and that the case was this. The defendant had received the money from the three together, and was certainly *not to deliver it until the same three demanded it*. She asked for no other condition, *let the same three men come, and it shall be paid*. This motion altered the whole course of proceeding, and according to Lloyd, in his *State Worthies*, brought Mr. Noy into notice (*The Percy Anecdotes*, *Anecdotes of the Bar*, Lond., Warne & Co., p. 311). I can scarcely believe that this case really occurred, for it exists in two other older versions; one in Val. Max. vii. 3, ext. 5, where Demosthenes takes the place of Noy, and again in the Greek Syntipas, the Seven Viziers, &c., which last version, and doubtless also the first, is derived from the East (cf. Benfey's *Pantschat*. i. 287). According to the narrative in Syntipas, the merchants give a purse in charge to a woman with the injunction only to restore it when they were all three together. They are then going to the baths, and send one of their number to borrow a comb from the woman. He, however, asks her for the purse, and when she refuses, the others call from a distance, "Give it him." The third then decamps with the money, and the woman refuses to make it good. A boy of five years of age sees her complaining in the street, and promises to put an end to her grief. On his advice she goes to the judge and promises to give back the purse, but does not do so when only two appear to claim it. We need not be surprised at finding that in the course of its wanderings the clever counsel came to be laid to the credit of Noy, as we also find it fathered upon a duke of Ossuna (see Leroux de Lincy, *Essai sur les fables indiennes*, p. 121).

To return to Bottrell, I should notice the very remarkable harvest custom (p. 200) in accordance with which "the last handful of wheat, called 'the neck,' was tied up and cut by the reapers throwing their reap-hook at it. Then it took a good bit longer to cry the neck according to the old custom of the harvest hands dividing themselves into three bands—one party calling three times as loud as they could cry, 'We have it, we have it, we have it!' the second demanding, 'What have ye? what have ye? what have ye?' and the third replying, 'A neck! a neck! a neck!' Then all join, hats in hand, in a 'Hip! hip! hurrah!' The neck was then decorated with flowers and hung over the board." This custom is to be met with in many places in England and Germany, see Simrock *D. Myth.*, p. 563 (3rd ed.), Kuhn and Schwartz, *Norddeutsche Sagen*, p. 514 sqq.; from the latter of which I cite the following references: Brockett's Gloss. of North Country Words sub voc. *Melldoll*, Grose, s. v. *Kernbaby*, Halliwell s. vv. *Mare* and *Mell*; *Monthly Mag.*, vol. xxxvii., "Reaping in Devonshire." The figure made of the last sheaf doubtless betokens a divinity, sometimes male, sometimes female, and bears different names. In West Cornwall, as we see, it is called *Neck*. Is this by any chance the same as *Nick*? Grimm (*Myth.*, pp. 456-7) is inclined to identify this name with *Nikarr*, i.e. Odin, and in fact, in a Yorkshire harvest dance, there appear a giant and his wife who are called *Woden* and *Frigga* (Grimm, p. 280 sq.; communicated by Kemble and taken from the mouth of an "old Yorkshireman"). That the old God should come as *Old Nick* to pass for the devil will surprise no one who knows how anxious the first missionaries were to bring about such a degrading transformation. Another noteworthy Egyptian harvest custom may be added to those hitherto quoted, from Diodor. i. 14: "Μαρτύριον δὲ φέρουσι τῆς εὐρέσεως τῶν εἰρημένων καρπῶν τὸ τηρούμενον παρ' αὐτοῖς ἐξ ἀρχαίων νομίμων. Ἐπὶ γὰρ καὶ νῦν κατὰ τὸν θερισμὸν τοὺς πρῶτους ἀμθέντας στόχους θέντας τοὺς ἀνθρώπους κόπτεσθαι πλησίον τοῦ ἔργματος, καὶ τὴν Ἰσιν ἀνακαλεῖσθαι καὶ τοῦτο πράττειν ἀπονέμοντας τιμὴν τῇ θεῷ τῶν εὐρημένων κατὰ τὸν ἑαρχῆς τῆς εὐρέσεως καιρὸν." Thus at the time of Diodorus there was still subsisting the *ancient* custom, according to which the reapers used to set up the first sheaf that was cut, and then begin to wail and call upon Isis. In this case the deity invoked is a goddess. It is only strange that thanks for the discovery of the cultivation of cereals should have survived in the shape of a mourning cry; or was this considered partly as a testimony of sympathy for her loss of Osiris as well as a token of honour? However that may be, there is an obvious analogy between the old Egyptian harvest custom and those still existing at the present day, in connection with which it may be noticed that in Germany the goddess Freia formerly appeared as Isis, and that it was probably in honour of her that a plough was carried about (Simrock, *Myth.*, p. 354).

Equally deserving of attention is what the author has to say respecting the so-called *Crick-stones* (p. 242), "In a croft belonging to Lanyon farm, and about half a mile north of the town place, there is a remarkable group of three stones, the centre one of which is called by antiquaries the Men-an-tol (holed stone) and by country folk the Crick-stone, from an old custom—not yet extinct—of 'crameing' (crawling on all fours) nine times through the hole in the centre stone, going against the sun's course, for the cure of the lumbago, sciatica, and other 'cricks' and pains in the back;" and further on: "The Tolmen in Constantine parish, and holed stones in other parts of the county, were used the same way as Lanyon Crickstone for curing various ailments. To cure boils and rheumatism, persons 'crame' nine times against the sun under a bramble growing at both ends." For the explanation of this usage, cf. my edition of

Gervasius of Tilbury, p. 170 sq., where I have shown by reference to European and Indian customs that the practice of dragging the sick head foremost and naked through hollows in the ground, through hollow stones, split trees, and under brambles growing at both ends, was symbolical of rejuvenescence or a new birth. Further remarks on the same subject I have given in Bartsch's *German*. xvi. 226.

In another passage Bottrell relates (p. 248) that two men who were at harvest work in a field belonging to a dying wrecker, near the sea, heard a hollow voice as if coming from it, which said, "The hour is come, but the man is not come." This exclamation recurs in numerous legends of Scotland and Germany, and always in connection with water spirits, as I have pointed out on the occasion of a similar legend from the South of France, given by Gervasius of Tilbury (pp. 39, 136), in which the water spirit of the Rhone cries out: "Hora praeterit et homo non venit!" This cry refers without doubt to the human sacrifices which in the period of heathenism in Europe used to be offered at stated times to the water spirits, so that when they were abolished, the enraged spirits used, according to popular belief, to utter this cry at the accustomed time to demand their victim. The expression "the river spirit claims its yearly sacrifice" is still used at times when men are drowned in a river (Grimm, *Myth.*, p. 462). In one of Callaway's Nursery Tales of the Zulus there is a passage referring to a similar subject (pp. 342-3), where we read: "So it was then among the Amakxosa, two damsels, one was the daughter of a chief, looked into a pool. They were drawn and went into it; *it was as though they were called*.....the beast did not let her go until they cast in two black hornless oxen; then it left her and ate them." Perhaps in this case also we have to do with traces of a sacrifice formerly offered to the waters or to the animals inhabiting them.

I come lastly to a singular expression used in West Cornwall: "to be hilla-riden" and "to have the stag" are the only names known to old country folks for the "nightmare" (p. 236). As to the meaning of *hilla*, it seems to me to be equivalent for *Hilda*, *Holda*, *Holla*, under whose leadership the witches ride abroad at night upon beasts, so that in many parts of Germany the *Hexenfahrt* is called the *Hollenfahrt* (Simrock, *Myth.*, p. 454). It is known from many legends that witches sometimes transformed sleeping men into animals upon which they used to ride to their meetings (Henderson's *Folklore*, &c., p. 154 sqq., and *Academy*, No. 80, p. 344). For *Hulda* see further Simrock, l. c., p. 323, where there is also mention made of a stag, who leads to the lower world, and perhaps also to the explanation of the Cornish *stag*. Finally, as to the *Legend of Pengersee* (p. 251), as Bottrell observes, it contains "what may seem to many mere childish fancies." They point perhaps to some of the late French rhymed or unrhymed *Romans de chevalerie* as their source, in which the like absurd adventures are often tacked together in the same senseless way. Yet the beginning of the Cornish narrative is not quite without interest, where it relates that a lord of Pengersee once started for the East in quest of adventures, there had a love affair with a princess, but abandoned her, and marrying in his own country had a son; after which his son by the princess came to Cornwall, but returned again to his own home and became a king there, &c., &c. This introduction to the legend bears a distant resemblance to the beginning of Wolfram von Eschenbach's *Parzival*, where Gahmuret of Anjou in like manner betakes himself to the East in search of adventures, has a son of the name of Feirefiz by the Queen Belakane, then leaves her and marries the queen of Wales, who makes him father of Parzival; after which Feirefiz comes to the West to his brother, but does not remain there, and finally becomes king of India,

and so on. Apart from this general resemblance, the details and the whole remaining course of the two narratives are entirely different, so that even if there is any real connection between them, to establish it clearly it would be necessary to discover the original source of the Cornish legend; for in its present form, as already observed, it is mixed with many later and for the most part silly additions. But it would be no slight matter if we had come here upon a trace, even though a slight one, of an hitherto unsolved riddle, the sources of Wolfram's *Parzival*!

FELIX LIEBRECHT.

Gabriel Denver. By Oliver Madox Brown. Smith, Elder, and Co.

In literary art, as in other art, there are two things to be desired—beauty of conception and skill of execution; and an artist is radically incomplete who does not aim at both, and does not attain to both in the maturity of his talent. But before the talent is mature, to be incomplete is pardonable, and we are all in the habit of accepting, not to say expecting, a particular kind of incompleteness. We are satisfied with the promise of a young artist who has an eye to ideal effects, and some power of producing them, even if he has little or no knowledge of the technical effects and no desire to escape his ignorance. Mr. Oliver Madox Brown is undeniably a young artist, and his book has its full share of the incompletenesses and crudities of youth; but his technical aspirations are already as well marked as his ideal aspirations; and both the one and the other have frequently a considerable measure of success.

Gabriel Denver is the son of an English father and a Portuguese mother, who is left with a sister and cousin (the cousin has Portuguese blood in *her* veins). He speculates, and loses money; his sister lends him enough to prevent his ruin. When she marries he borrows of the cousin to repay her. The cousin obtains a promise of marriage, which he has no conscious reluctance to fulfil, and the day for the ceremony is fixed. Two months before the date arrives the hero is informed of an inheritance in England: his cousin allows him to go to look after it at the expense of postponing the marriage, but determines to accompany him herself. They are the only passengers except a beautiful orphan and her aunt, who dies at the beginning of the voyage. Gabriel had met the orphan before, when she was only eleven, and came to fetch help for her father, who had been poisoned by robbers. He had only two thousand pounds then, but we learn at the end of the book that he lived long enough to make a fortune, which enables the heroine to treat the hero's inheritance of eighteen or nineteen thousand as a trifle. Of course Gabriel and the orphan fall in love, and of course the cousin will not abandon her claim. On the night of what should have been the wedding day she surprises Gabriel when he expected Laura whom he loves, and after a stormy scene fires the ship. Ten of the sailors escape in one boat from the fore-castle; Gabriel, Laura, and the cousin escape in another from the quarter-deck. After four days' exposure without food or drink, except as much water as can be collected in clothes after a shower, they are picked up by the "Albatross," which had already crossed their track once before at night when Gabriel was too hopeless to watch. Meanwhile the cousin dies mad after drinking salt water, and Laura nearly dies of hunger and thirst. After they are picked up Laura is delirious, and there is a tornado, and Gabriel is delirious and talks to his cousin's ghost and tries to throw himself overboard. They are landed at the Cape; Laura nurses him; he recovers, and they marry and live happily in Devonshire. We leave

them watching a storm at Combe Martin with their daughter, when the water is phosphorescent as it had been on the night they were left adrift and the burning ship had gone down.

It will be seen from this analysis that the situations succeed each other in the simplest and most inartificial manner possible; perhaps even this analysis is enough to show that the situations themselves are ingenious and intense; and this would certainly appear from reading the book. Only in one sense little is made of them, because the complicated situations are never worked out into the entanglement of issues that we continually suspect the author of having prepared. Gabriel abandons himself at once to Laura; Laura accepts him unobtrusively, the cousin has no movement of generosity or even of disdain. The author spends a great deal of ingenuity in making elaborate arrangements in order that something very simple may happen. Indeed some of the ingenuity seems thrown away altogether. The escape of the ten sailors without the knowledge of the hero and heroine, and the miraculous legends which they circulate about the burning of the ship and its consequences, lead to nothing whatever; and it is doubtful whether it was worth while to suggest a parallel with the Albatross (the bird) that circles round the burning ship and perishes in the flames, and the "Albatross," the ship that circles round the castaways and very nearly perishes itself in the circles of the hurricane.

In fact the whole book leaves the reader under a curious uncertainty, whether an originally meagre story has been enriched with numerous illustrations by a very distinguished artist in words, or whether the author has had the courage to piece together the best effects to which he was led in the course of a narrative perhaps neither probable nor interesting, and to suppress the greater part of the narrative. Either hypothesis would account for the fact that the book seems unfinished as a whole, while the parts are highly finished in themselves, and with a view to their aesthetic effect on one another, though not to their inner coherency.

Within these limits the book is a very striking one indeed; there can be no doubt of the author's original power and of his sense of beauty, and there are traces of a great deal of well bestowed work, not merely in its aesthetic contrasts, but in the fulness of knowledge with which Australia and Cape scenery, and the incidents of navigation are described; and it ought to be added that with all its crudities the book is thoroughly readable from first to last. The following description of how the master of the "Albatross" first sighted the lovers and the dead cousin adrift in the boat, is a fair specimen of the weird charm and richness of the author's style:

"Just then the light of the sun broke, radiating over the stormy waters, and clearing away the dusky half-obscurity. The master of the ship obtained his spyglass and brought it to bear on the boat and its occupants. They were as yet about three miles ahead, but a strange sight was suddenly brought within two or three feet of his eye by the telescope. It was a large old-fashioned boat, wide and flat and strong. A woman was standing at one end of it, violently confronting and upbraiding a man, who knelt down, apparently leaning over some one in the bottom. Suddenly the woman dashed her arms up wildly, as though she had received a sunstroke, and then fell back in the stern-sheets of the boat. The man rose, clasping his forehead with his hands, and looking right in the woman's face, which still remained visible above the portoise. A fearful look, indicative of incomprehensible feeling (not sorrow, as could be seen even at that distance), convulsed his features, then he bent down in the boat, looking up no more, so that his face was hidden.

"They were lost for a moment in a deep hollow of the sea, and when they rose into the sunlight again, it gleamed fearfully on the woman's eyes, but she never moved to avoid it."

It is to be hoped that in another edition the master may

get his spyglass or send for it instead of obtaining it, and that a little excessive emphasis may be suppressed here and there, and that as the ship on the cover would not look well without three masts the author will retrench the assurance on page 26 that the Black Swan had only two. These of course are only superficial blemishes. A severe critic might object that the author ought to have decided whether he meant to write a novel or a prose poem, and that for want of stating the question to himself he has written neither a novel nor a poem, but a melodramatic idyll. It might be replied that perhaps a melodramatic idyll is as legitimate as most other forms of experimental art, and that at any rate this idyll is presented with so much artistic tact in essentials that whenever the author writes a real novel we may rely upon its being thoroughly poetical.

G. A. SIMCOX.

### LITERARY NOTES.

There is almost always something melancholy in the old age of the greatest men, for however gracefully they may withdraw from the front rank of active workers, and however fresh their powers of perception and judgment may remain to the last, it is impossible not to compare them with themselves as well as with the ordinary mortals to whom they are still superior, and equally impossible to escape the painful consciousness of gradual decay which the comparison obtrudes. Sir Henry Holland's reputation was not of such tyrannical dimensions as to make it dangerous for him to grow old, and the powers of his intellect might not perhaps have been adequately appreciated unless their quality had been proved by their exceptional vitality. The volume of *Personal Recollections* published only last year—by the man who introduced the vaccine virus into Iceland in 1810—had an autobiographical interest quite apart from what the author had to tell of the eminent men and women whom he, who knew everybody, had known, and of the remarkable sights and places that he, who had been everywhere, had seen and visited. His life was an eloquent homily on the advantages to a man of literary tastes and moderate literary ability of following some other profession than literature. His three favourite amusements, society, travel, and the composition of Quarterly Review articles, only occupied the leisure of an active professional career, and his example might certainly be quoted in support of the deliberate opinion which he published as an octogenarian, that the faculties are much more frequently impaired by premature disuse than by the inevitable effects of old age. He himself never quite gave up practice, never lost the habit of trying to pass every pedestrian who was before him on the pavement—though he averred that the Londoners of to-day walk faster than their fathers—and never learnt to prefer the straight to the diagonal line in crossing a street, though in this respect too the lapse of time cannot have made his usual course the easier. He did not suffer from that wear of the mind from being turned inwards, of which he speaks in one place, *apropos* of metaphysicians whom he had outlived, after they themselves had survived their own powers, nor from the exhaustion that ensues when the mind has used up its own substance in original production; while his powers of apprehension remaining undiminished, he was never thrown back to live merely in memories that are constantly losing their interest for a younger generation. Of the two veterans of literary society with whom it is natural to compare him, Rogers, and Crabb Robinson, the latter was never more than a listener, a Boswell with more intelligence and self-respect, amongst the great whom he delighted to honour, while Rogers, having outlived the brilliant society in which his personal qualities secured him a place out of proportion to his literary merits, sank, and did not improve his temper by knowing that he had sunk, into the mere *raconteur*, the teller of stories that would have been excellent if he had not told them before. Sir Henry Holland, on the other hand, though on terms of acquaintance or friendship with all the notabilities of the century, did not, and from the exigencies of his profession, evidently could not have sought their acquaintance merely as notabilities; he only had the gift of making friends of those with whom he was brought naturally in contact, and of profiting by the accident, as it may be called,

that nearly all the persons with whom he was brought in contact were in some way interesting or distinguished. He was born in 1788, left school young, and for a few months thought of being a merchant, chiefly for the sake of the intercourse with distant countries kept up by commerce, but soon discovered his mistake, and began to study medicine; he wrote a short account of the visit to Iceland already alluded to, but his first publication of any importance was a volume of travels in Greece, published in 1817, and illustrated in the old-fashioned style after his own sketches; he speaks in his *Recollections* of the severity of the cold in Athens—the winter that destroyed the French army in the retreat from Moscow. After travelling for a year with the Princess Caroline as medical attendant, he established himself in London practice, making from the first a rule of keeping two months of the year free for foreign travel, of not allowing his income to exceed £5,000 a year, and of reserving leisure for society and the scientific studies in which he was interested; resolutions of which he never had reason to doubt the wisdom. His passion for travel seems to have had two main sources: on the one hand the pleasure in strange scenery which belongs more to the physical geographer than to the artist; the love of nature in her active moods, for rivers, seas, volcanoes, or the larger landscapes that tell their history to a practised eye: on the other, a taste for the intellectual sensation, as we must call it, of passing abruptly from one group of associations to another, of intensifying the enjoyment of civilized ease and rough adventure by bringing the contrasted extremes as near together in time as was possible, or by the merely mental transition from the solitude he had travelled a thousand miles to reach—and write an article for the *Edinburgh* in—to the scientific subjects of meditation he carried with him. The articles which were the fruit of this Epicurean industry were reprinted in 1862; those which the author regarded with especial affection were on the physical geography of the sea, the Atlantic Ocean, and the Mediterranean, subjects connected with many of his most interesting recollections, though it is not, we believe, in them that he speaks of what had struck him as the most impressive of spectacles, to see over a level reach of sea or desert the setting sun and the rising moon above the horizon together, with nothing between them but the uniform, unbroken surface of earth and sky. In the *Personal Recollections* he speaks of the remarkable change that had taken place within his memory in the current conception of the nature of proof, which he of course traces to the development of physical science; and without in any way disparaging his papers on strictly scientific subjects, we may trace something of the change in his own style, which is more literary, less concrete than that of a younger man would probably have been. He published two small volumes on subjects more immediately connected with his profession, in the latter of which he defended himself from the charge provoked by the former, of extreme medical scepticism; the fact seems to have been that though quite willing to accept new theories for which there was sufficient evidence, he doubted whether any part of the theory of medicine was yet so sound and complete as to dispense with the need for trained intuition and the incommunicable power of connecting symptoms too slight to be referred to the more general causes as yet alone understood. A point connected with the physiology of thought which he discusses, the relation of consciousness to time, and the possibility of *lengthening time* by quickening consciousness, suggests a qualification for a remark in the *Recollections* that men live faster now than formerly; if it is living fast to fill time full, no doubt this is true in a mechanical way, that more ground is traversed and more changes experienced in a given time; but it is a serious question whether the mind is proportionately more alert, awake to a greater number of distinct impressions than in the generation of which Sir Henry Holland was not the least distinguished, one of the most amiable, and, it is to be feared, the last representative.

By the death of the King of Saxony Europe has lost one of her foremost Dante scholars—perhaps, with the exception of Karl Witte, the most distinguished of all. The work which embodies his studies on this subject is his German translation of the *Divine Comedy*, published under the name of "Philaletes," the first instalment of which was brought out as long ago as 1828, and the work was concluded in 1848, a year of great political danger to King John, as well as to many other of

the crowned heads of Europe. The translation is in blank verse, the choice of which, in preference to any more elaborate metrical system, was rendered almost necessary by the author's desire of reproducing with photographic accuracy the details and shades of meaning of the original; and the great merit of the execution consists in the way in which this is carried through without causing stiffness or hampering the freedom of the rendering. But the value of the commentary which accompanied the translation was still greater. Up to that time hardly any satisfactory notes, either ancient or modern, existed in elucidation of Dante's historical allusions, and but little had been done even in Italy in the way of local illustration. It was reserved for the King of Saxony to investigate thoroughly the original authorities with the view of throwing light on this subject, and the results, whether embodied in notes or excursuses, are of the highest value. No less meritorious were the author's studies of the works of the Schoolmen, the knowledge of which is indispensable to the understanding of Dante's philosophy and theology; these have borne fruit especially in the notes of "Philaletes" to the *Paradiso*. Among English writers on Dante, Mr. Cayley in particular, in his admirable version in *terza rima*, has made especial use of this commentary.

In *Fraser* (Nov. 1) there is a paper by Mr. Leslie Stephen on Jonathan Edwards, in which some approach to justice is done to the singular subtlety and originality as a thinker of that little-read Calvinist divine, whose place in philosophy is between Hobbes and Spinoza, with both of whom, though he had probably read neither, he is at times almost verbally in agreement. But Mr. Stephen cannot forgive his author for having sincerely believed in hell-fire or for preaching about it to little girls of five, and what is more curious, he writes of this unfortunate doctrine as if the best reason for not believing it were—not that the evidence for its truth is inadequate but—that it would be extremely shocking for it to be true; of course Edwards thought it was both shocking and true, taking the letter of Scripture as a sufficient proof of its truth, and it seems unreasonable to blame him either morally or intellectually for not having arbitrarily rejected one of the corollaries from the theory of inspiration which he shared with most of his contemporaries. It would have been fair to add that if Jonathan Edwards' hell is grim and material, his conception of the joys of heaven is remarkably humane and spiritual. In the same number Mr. Baring-Gould gives some account of the *Acta* of S. Symeon Salos, "who became a fool for Christ," a saint of very unedifying life and conversation, who would bring more discredit on the Church which acknowledges him were it not evident—as Mr. Baring-Gould strangely fails to remark—that his legend is mythical; the Lives of the Saints abound with incidents that have strayed out of popular, often Pagan, tradition, and S. Symeon is only the half witty, half malicious fool of common folk-tales, who in the Middle Ages was by no means infrequently invested with Holy Orders.

*Cornhill* contains an instructive account of the rise of the farmers' "Granges" and Clubs in America and the war between the agricultural and the railway interest; also some amusing translations of "Tyrolese House-Mottoes."

The popular songs of Tuscany, of which Mr. J. A. Symonds translates some specimens with all possible fidelity and taste in the *Fortnightly Review*, are perhaps even more untranslatable than is usual with popular poetry, for besides the music of the language, most of which must be lost in English, there is something in the thought of most of them that seems to rebel against reproduction in the logical speech of a *Cultur Volk*, in which the sense seems to be broken by the abrupt transition from one image to another that contrasts with the frequent return upon the same image or the same phrase in poems seldom more than twelve lines long; though in the originals, sung slowly by those who feel the aptness of each image as they linger on the cadence, the connection is quite close enough for sentiment and even for literary elegance. With admirable candour, instead of the concluding paper of his own series on National Education (which is to be published immediately in a volume), Mr. Morley has given place to some corrections by Mr. J. G. Fitch of the most damaging

figures used to prove the complete failure of the present management of National Schools, joined with some judicious remarks on the negative character of the agitation carried on by the Education League and the political dissenters.

The Sept.-Oct. number of *Trübner's American and Oriental Literary Record* contains a strangely elaborate and objectless hoax. Under the guise of recording an interview with the well-known Norwegian poet, Bjørnsen, the author declares that being at Trondhjem, and "having nothing better to do," he walked out to visit the poet, who is feigned to be priest of a neighbouring parish mentioned by name, and that he found him in deep depression. The conversation is given at great length. Bjørnsen declares to the ingenious stranger that he is miserably poor, that he gets nothing by his books, that his income as parish priest is insufficient for his needs, and that he is on the point of emigrating and beginning life again in the United States. As a fact, Bjørnsen lives close to Christiania, 250 miles from Trondhjem, gets a large income from his works, lives in comparative luxury, and has never dreamed of entering the church. The only spark of truth in all this story is that Bjørnsen is really about to leave Norway; he has bought a house in Florence. What, we would ask, can be the object of such laborious romance?

Of the Norwegian poet Ibsen's new drama on the Emperor Julian, 4000 copies have been sold in a single week, though it is an unusually large and expensive volume.

## Art and Archaeology.

*History of Ancient Pottery, Egyptian, Assyrian, Greek, Etruscan, and Roman.* By Samuel Birch, LL.D., F.S.A., &c. London: J. Murray.

It is now sixteen years since Dr. Birch published his erudite *History of Ancient Pottery*, simultaneously with Mr. Marryat's *History of Mediaeval Pottery and Porcelain*, the two forming a comprehensive history of the potter's art. Since the period of their publication, archaeological knowledge has so increased and facts have so accumulated that it has been found necessary to subject both works to complete revision. The new edition of Dr. Birch, though compressed into one volume, has been considerably increased in its matter, and indeed has been almost rewritten. It is therefore matter of regret that the author, in remodelling the Greek section of his subject, has given little more than a passing mention to such recent theories as those of Brunn and Conze. Brunn's theory has indeed been received with pretty general hostility; still the eminence of its author required that it should be fully stated.

Dr. Birch begins with a graphic sketch of the pottery of Egypt, Assyria, and Babylon, "the triple cradle of the human race"; he describes their sun-dried products, the infantine efforts of ceramic art. Thence he proceeds to the clay and straw bricks of the Egyptians, and their numerous works in porcelain, coated with a siliceous glass of celestial blue, "scarcely rivalled after thirty centuries of human experience." The wondrous products of Assyria and Babylon next follow, their glazed wares going back to remote antiquity, while their use of the tin enamel glaze anticipated by ages the re-discovery of its processes in Western Europe.

Clay was employed by the Assyrians and Babylonians for their public archives, their astronomical computations, their historic annals. The name of Nebuchadnezzar has been found stamped upon a Babylonian brick; the history of Tiglath Pileser and Esarhaddon, the wars of Sennacherib against the King of Judah, are among the events detailed upon their cylinders, and a detailed history of the Assyrian monarchy is now furnished by the happy employment of

this humble but indestructible material. "While the paper and parchment learning of the Byzantine and Alexandrian schools has almost disappeared after a few centuries, the granite pages of Egypt and the clay leaves of Assyria have escaped the ravages of time and the fury of barbarians."

The second part of Dr. Birch's work treats of Greek pottery. The author points out how extremely difficult it is to ascertain the age of the oldest Greek vases. "The first traces of Greek art and refinement appeared upon the coast of Asia Minor. The Greeks there placed in contact with the old and magnificent monarchies of Asia became imbued with the love of luxuries unknown to those of their race who inhabited the bleaker shores of the Peloponnesus. In the *Iliad*, which presents a glowing picture of early civilization, the decorative, as well as the useful arts of life are frequently described; and amongst them that of the potter is not the least prominent. Thus we find the dances of the vintage compared with the revolutions of the potter's wheel; and the large wine-jar or *pithos* is mentioned, which held the whole stock of wine belonging to a household, and which was in fact the cellar of the Homeric age," as it was subsequently the dwelling of the cynic philosopher.

The early vases are decorated with zones or bands enriched with animal forms in the most primitive style, distinguished by the extreme stiffness of their attitudes and their lengthened proportions; in the absence of human figures and in the style of the animals they present a great analogy with Oriental art, and enable us to class them as probably belonging to the heroic ages. But while Dr. Birch includes with these vases, as the product of one period, the other series in which only geometrical patterns occur; Conze maintains that the latter are a distinct class, and were the work of native Greek potters at a time previous to that intercourse with the East from which they derived the designs of animals disposed in parallel zones.

The next style preserves the archaic character: the animals are represented in rows facing each other, the ground strewn with flowers as in the robes of the Nimroud bas-reliefs, the subjects taken from Asiatic tapestries. Such vases also belong to the dawn of the art, derived from Oriental sources. Later, the human figure is introduced, to which period must be attributed the Dodwell Vase, representing a boar hunt, with figures and animals.

But most renowned among the archaic vases is the cup of Arcesilaos, king of Cyrene; he is represented seated, Dr. Birch says, in his palace, but the engraving looks more like a tent, presiding over the weighing of the drug silphium, which was one of the staple products of his country. Large scales are in front of the king, who is surrounded by attendants; one extends his arm to adjust the balance, another carries on his shoulder a bag of the precious substance, another watches the weighing of the merchandise, while a fourth raises a bag of the same, exhibiting it to the king. This singular picture of the manners of the age (circ. 458 B.C.) is in the National Library of Paris.

Greek art was conventional, and the slowness with which it emancipated itself from the thralldom of its origin is evident in the progress of painted vases. As long as these stiff hieratic forms prevailed, the black figures on the red clay were sufficient, but when it was required to express the soft contours which marked the more refined grace and freedom of the rapidly advancing schools of sculpture and painting, the colour of the figure was changed to red, and the general effect is improved, not only by the fineness of the clay, but also by the brilliancy of the black glaze of the ground. This is the highest development of Greek art. The principal outlines are rendered with wonderful spirit

and truth, and their great charm consists in the beauty of the composition, the perfect proportion of the figures, and the style of the draperies, which "bear great resemblance with the sculptures of the Parthenon, to those of the temple of Phigaleia, the balustrade of the temple of Victory, and other works acknowledged to be of the finest period of Greek art. All that is told of the style of painting of Polygnotus, Parrhasius, and Zeuxis may be traced in the designs of these vases."

Thus did the Greeks animate the coarse, porous earth with their elegant but sober decorations, perfect models of form, design, and composition, and though their productions are without the additional charm of colour possessed by other ceramic works, elevate the common material to the rank of the most esteemed masterpieces of the art.

We cannot follow Dr. Birch through the whole of his interesting history. He gives the various subjects of the vases derived from the Wars of the Giants, the *Iliad* and *Odyssey*, the exploits of Bacchus and Hercules, the Theseid, and endless sources, the different forms of the vases, the names of the artists, &c. The subject is inexhaustible as are the vases themselves. The British Museum alone contains 5,000; 3,000 were discovered in one year by the Princess of Canino, and the whole number that have been brought to light is estimated by De Witte at 50,000. Greek vases have been fully treated in the labours of Lenormant and De Witte, Inghirami and Stackelberg, Gerhard and other continental writers, but since the treatise of Sir William Hamilton, neither public patronage nor private enterprise in England has undertaken works equal to those published abroad, desirable as such publications are in a country where pottery is so considerable an object of production.

Let the Trustees of the British Museum then take the initiative, and publish a series of illustrations of their rich collection to accompany the two volumes of catalogue which have already appeared under the learned editorship of Dr. Birch and Mr. Newton. F. BURY PALLISER.

### THE NEW MANTEGNA.

A GRANT of £1500 was made by Parliament at the close of the last session for the purchase of a picture by Mantegna for the nation. This picture, which was first exhibited on the 3rd instant in the National Gallery, is the so-called "Triumph of Scipio," executed by Mantegna in 1505 for Francesco Cornaro of Venice, and last in the possession of Captain Ralph Vivian in London.

Numerous opportunities have been given to the English public of seeing this production of the great Paduan master. It was exhibited in 1835 at the British Institution, in 1857 at Manchester, and in 1871 at the Royal Academy. On a long canvas, 8 ft. 10 in. by 2 ft. 4½ in., we have a representation of a subject properly described by Mr. Wornum as "the reception of Cybele among the divinities of Rome." The bust of Cybele is carried on a litter by four men, preceded by a messenger, who presents it to the kneeling figure of a Roman lady (? Claudia Quinta), behind whom, to the right, Scipio Nasica and other members of his family stand in decent reverence. Three of the figures to the right are descending the steps of a palace, the last of them being a player with a pipe and drum. In the background behind the litter are two truncated pyramids surmounted by plinths, on the faces of which we read the following inscriptions:—

"P. SCYPIONIS  
EX HISPANENSI

• BELLO  
RELIQVIÆ

and S. P. Q. R.  
GN. SCYPIO  
NI CORNELI  
VS FP (?) "

At the base of this picture :

"S HOSP. S NVMINIS I. (?D)AE C."

In a letter to the Marchioness Isabella Gonzaga, dated January 1, 1505, Pietro Bembo enters upon a long and passionate statement of the complaint of his friend Francesco Cornelio (Cornaro) at Venice, whom he describes as having given an advance of 25 ducats to Mantegna for a picture which he subsequently refused to part with because it was larger and more expensive than he had at first calculated. At Mantegna's death, this picture, described by Lodovico Mantegna as "Popera di Scipioni Cornelio," was found in the master's painting-room and seized for a debt by the Cardinal of Mantua. It was subsequently transferred, against the will of the painter's executors, to the Cornaro family, and till after 1815 adorned, as Moschini tells us, their palace in Venice. Having then been sold to the picture dealer Sanquirico, it was exported to England, where Mr. George Vivian bought it.

As an example of the later style of Mantegna the picture is no doubt of considerable interest, but it is not executed with the delicacy or tenderness which we still discern in some of the fragments of the "Triumph," and the drawing is as coarse comparatively as the touch is rough. The treatment betrays an aged hand and declining taste both as regards conception of movement and shape or making up of dresses. It is peculiarly disagreeable in the red and yellow stones of the ground; more so still in the parts which have been subjected to a (perhaps) necessary restoration, such as the bending figure of the Roman matron in the centre of the canvas, and the face of the soldier to the right holding a lance.

To sum up, there is just as much difference between this piece and those which Mantegna painted in his prime, as there is between the great masterpieces of Botticelli and those which he produced in his later days for the mere purpose of making money rapidly.

J. A. CROWE.

### THE THEATRE.—MADAME RISTORI.

FOR a few weeks at Drury Lane during the season, and now again for a month at the Opéra Comique, the English public have had the opportunity of seeing Madame Ristori in several of her most famous characters. Nor have they indeed been slow to take this opportunity; nor, so far as one can judge, has Madame Ristori failed to convince them not only that her powers are very great, but that they never were greater.

Madame Ristori is an actress apart from all others. Upon all those who have not seen Rachel (and upon many who have) her performances produce the impression of a new art. It is as if you showed the great interpretative etching of a master to persons who had hitherto been satisfied and delighted with the exact and mechanical reproductions of the craft of the photographer. The one may have more of realism: the other, of the undefinable qualities of genius and of style. And it is this other, of course, to which I venture to compare the art of Madame Ristori; for her art is not so much one of minute portraiture as one in which abstraction and selection, applied judiciously, count always for much. She indicates and suggests more than she actually portrays, and the world in which she moves as an artist is to some extent an ideal world, and in so far as it is that, the lives and feelings of its denizens are different from the lives and feelings with which we are familiar to-day, and which a great French artist—Mademoiselle Desclée—has mirrored for us in a dozen realistic impersonations. Not indeed that Madame Ristori is unnatural at all, for no one has her power of conveying to us, who most of us sorely need it, a sense of the possibility of high tragedy, of grand yet simple emotions in a world in which we were not born. But it is the grandeur and the exaltation that are new to us, and it is these perhaps which enable her to fulfil more perfectly than that wilder and stronger genius, Madame Rachel, the aim of tragedy—"to purify through terror and pity." Sometimes she is defiant and terrible: more often she is pathetic: but it is the nobility and beauty of her characters that throw oftenest into the shade all other qualities and all surroundings. And she has nothing of the feverish organization common to our time and to the French actresses—such as Rachel and Desclée—who most accurately and terribly reflect it.

The range of Madame Ristori's complete success is only a little less wide than that of her effort, and the last embraces the highest dramatic creations of nearly every land whose drama is recognized. She has endeavoured to embody, and for the most part has succeeded in realizing, one or other of the best conceptions of Greek, Englishman, German, and Frenchman; and though so much at home, is yet not more at home with the Greek beauty and terror of Medea than with the weird horror of Lady Macbeth, the slow sadness of Marie Stuart, or the loves, aspirations, and vengeance of that Lucretia Borgia whom Victor Hugo imagined and portrayed in a moment of even unwonted power. Of these performances, Marie Stuart has been thought by some to be the least satisfactory. The fault is probably that of Schiller, and not of Madame Ristori; for whatever it may seem to the patient German mind, to the English mind and the French this *Marie Stuart* does not appear to be an acting drama. Like any other piece, its poetical beauty evaporates in translation; and unlike most other pieces of equal fame, little is left when this evaporation has taken place. For there is scarcely any theatrical "situation," very little incident, and a long opportunity for the display of emotions less than commonly varied, and which only the art and feeling of Madame Ristori can save from proving a weariness. Besides, there are two acts in which the great actress is wholly absent from the stage. But here as elsewhere her conception is that of a mistress of her art, and her magnificent moments are not rare. Of these let us recall one: it is the time when Marie, humbled in circumstance but not in heart, essays to kneel before the English Queen. The action not only wounds her pride: it is against all her traditions: and more, it is hateful to her personal feeling. At first she will submit: she will conquer herself; but no—it is a yoke to which she cannot stoop. And Madame Ristori rises and turns, with a gesture of misery; for repugnance has conquered will.

Perhaps it is hardly fair to speak of the little bit of *Macbeth* which has been seen this autumn. These isolated scenes—it was here the Sleep-walking scene—can never do justice to artist or spectators. But the thing was done in English, was for that reason interesting as giving possibly a wider hope for another day, and was received with quite unbounded enthusiasm by an audience which must have numbered many fine judges. To my own thinking, it did not quite realize the promise of its commencement. The English, wonderfully free and correct at the beginning, became less distinct towards the end; and the most striking effect was produced at first, when Lady Macbeth enters "in a most fast sleep":—

"You see her eyes are open."

"Ay; but their sense is shut."

And this, Ristori absolutely realises.

Victor Hugo touched a subject thoroughly congenial to him when he wrote for the French theatre upon the story of Lucretia Borgia a play which would be intensely sensational if it were not also most literary and artistic. That is a happy time for the great French genius of adventure and experiment, when no life is sure for a single day, "what with war, pestilence, love, intrigue, murder, poison, and the Borgias." The wild uncertainty of life which fascinates him so strongly is found among all classes in Ferrara when Lucretia is supreme, and there are memories of the violence of Caesar done upon John. Writing in the tranquillity of Guernsey during the prosperity of the Empire, he had, in his stories of our time, to seek his favourite themes and circumstances chiefly in the lives of social outcasts; and so we had *Les Misérables*. But in the drama of *Lucretia Borgia*, M. Hugo did not confine himself to the horrors. He endowed his Duchess with fine aspirations, making her repent with tears, and again become incarnate cruelty. There is endless variety, and that is why no single part can be better suited to show the range of Madame Ristori's art. Of its different manifestations, that of vindictiveness is, I think, the least powerful. Great is the genuine tenderness, most artful the cajolery, most intense the dread of discovery and the terror at death for her son, and then, at her son's hand, for herself. The most notable scene—perfect as a whole and perfect also in its parts—is that in which she supplicates her lord to spare Gennaro, who has insulted her name, but whom her husband thinks to be her lover, and whom *she* knows to be her son. And the subtlest and finest moments in this scene are possibly those in which the Duchess, struck suddenly by her husband's

charges, accompanied by the most terrible threats, which he has the power to enforce, is first amazed, helpless and stunned, and then collects her thought with such an energy as could be shown only by a woman of great intelligence at the call of a great passion. That struggle first for thought and then for expression, to suggest that if the youth is her insulter he cannot be her lover too,—that portrayal of a crisis when all but the strong would have abandoned effort, and the strongest can but make it with a mind now fully master of its intentions, but hardly, indeed, of its means,—nothing that I have seen in English and French theatres for say a dozen years, quite equals this moment of Ristori's in quiet intensity and truth.

FREDERICK WEDMORE.

### NOTES ON ART.

By an unfortunate oversight, a note was inserted in p. 407 of our last number respecting the bas-reliefs found at Salonica, in which the popular interpretation of them is reiterated, which we had been at the pains to combat in p. 387 of the previous number. We adhere, of course, to the views expressed in the longer note on p. 387, which are our own, and not to those expressed in the short note on p. 407, which are those of the *Levant Herald* and the *Pall Mall Gazette*.

The sculptures of the so-called Nereid monument from Xanthos now in the British Museum have always since their discovery by Fellows in 1846 been regarded as very important examples of Greek work, but never adequately published, and hence never fully discussed in relation to other remains of Greek art. To remedy this Prof. Michaelis, of Strassburg, has just had a new set of drawings made from them, which he will publish with a commentary in the *Monumenti and Annali* of the Archaeological Institute of Rome, and afterwards possibly as a complete work in an enlarged form. The history of Lycian art generally is still obscure enough, especially in the matter of its affinity to Athenian sculpture. It has been usual to speak of the sculptures of the Nereid monument as executed in the spirit of the second Attic school, and even to point out certain details in the treatment of the draperies in the statues of the so-called Nereids which occur in the sculptures of the Parthenon and appear to have been peculiar to Athenian work of the best time. The frieze is executed with comparative carelessness, probably the result of employing local artists to carry out the design. But we must wait for a fuller examination of these matters. Meantime it may be mentioned, as an illustration of the misfortunes which have beset the Lycian sculptures in the way of becoming known beyond the British Museum, that part of them were published last year with a doubtless learned commentary in the Russian language.

The history of Greek art on which Prof. Brunn, of Munich, the well-known author of the *Geschichte der griechischen Künstler*, has been engaged for rather more than two years has advanced to the time of Pheidias, though the difficulties of the period immediately before that are not yet quite overcome. One of these difficulties is raised by the style of the existing fragments from the metopes of the temple of Zeus at Olympia, the sculptures of which were executed under the direction of Pheidias. The sculptures of the front gable or pediment were from the hand of Paonios, a native of Mende in Thrace, and it is proposed to account for the harmony of style which doubtless existed between his work and that of Pheidias by assuming the latter to have been influenced in the formation of his style by the school of sculpture in Northern Greece whence came Polygnotos, who was a sculptor as well as a painter, and at the same time the first instructor of Pheidias.

The metope and triglyph of a temple, a plaster cast of which was referred to in the last number of the *Academy* as having arrived in the British Museum, was discovered by Dr. Schliemann in the autumn of last year, in the course of his excavations on the site of Novum Ilium. On the metope is sculptured in relief the quadriga of Helios, the face of the god bearing a strong resemblance to the type which occurs on a coin of Alexander I., king of Epirus, B.C. 342-326. In both the crown of rays characteristic of Helios is also rendered in the same way, as opposed to its usual form on other coins. As

regards the style of sculpture in the horses as well as in the figure of the god, there would probably be little question about assigning it to the Macedonian period, were it not that this peculiarity in the channels of the triglyph, that they stop short some distance from the bottom, has not yet been found in architecture previous to the Roman period.

The current number of the *Gazette des Beaux-Arts* contains the following articles: 1. A short paper, by Ernest Renan, entitled "Les Dircés Chrétiennes," elucidative of a passage in the first epistle of Clemens Romanus, in which he speaks of "the Danaïdes and the Dirces having endured terrible and impious monstrosities for the sake of their faith." M. Hefele, Bishop of Rothenburg, first surmised that these names were not those of the Christian martyrs themselves, but of the *rôles* that the pious women of the early Christian Church were forced to play in the Roman Amphitheatre. M. Renan brings forward in support of this opinion a fresco at Pompeii in which the fate of Dirce, who was dragged to death by a wild bull, is represented as a spectacle. This representation, M. Renan considers, was probably painted from an actual scene in a theatre, in which possibly a Christian was the victim. That the Romans found amusement in this fearful reality of their acted tragedies is too well attested a fact to allow of doubt. —2. A third notice of the Wilson Collection, in which the later Flemish and the English pictures are criticised. The *Gazette* has certainly made good use of the Wilson catalogue. Every number lately has contained two or three etchings from it; but the plates are getting terribly worn. In the present number the fine portrait of Jasper Schade van Westrum, etched by Ch. Waltner after Frans Hals, has lost all its delicacy; and the Widow and Child, etched by J. Jacquemart after Sir Joshua Reynolds, is greatly blurred. —3. An interesting history and description of "Some Satirical Prints for and against the Reformation," by Champfleury, to be continued. —4. A continuation of René Menard's notice of the Vienna Exhibition, criticising the French pictures and sculpture. —5. "The Japanese Bronzes exhibited in the Palais de l'Industrie," with many curious illustrations of these remarkable works of oriental art. —6. "The Rohan Service," a Sèvres service which was acquired by Lord Dudley in 1870 at the San Donato sale. A saucetureen of silver, richly ornamented, belonging to the Rohan Plate, is engraved. —7. "The Iconography of Alcibiades, Statues, Busts, and Portraits," by Henry Houssaye. A fine etching of a Wolf by G. Greux, after Peter Potter, is the chief pictorial feature of the number.

A loan exhibition of the works of old masters has been organised in Brussels by the "Société Néerlandaise de Bienfaisance." The chief feature of this exhibition is the number of works from the celebrated Suermondt collection, which has contributed no less than 120 paintings and 44 drawings. Among these we find as many as three Van Eycks, one of which, known as "L'homme à œuillet," was engraved a short time since in the *Gazette des Beaux-Arts*. It is one of Van Eyck's most admirable portraits. The recently discovered master, Gerard David, has a picture ascribed to him, and there are several others of the early Flemish school in this collection. The old German school is likewise represented by some of its chief masters, but as might be expected, the wealth of the exhibition lies in works of the later Netherlandish schools. Rembrandt, Frans Hals, Paul Potter (by whom we have the famous landscape of the Suermondt collection, "Bois de la Haye"), Albert Cuyp, Jan Steen, and many more of the later Dutch masters, may be studied to advantage in this small but rich exhibition. Truly the art tourist has had a great advantage this summer in being able to view without difficulty or favour in so many of these loan exhibitions the treasures that usually lie hidden or inaccessible in the depths of private houses.

The excellent series of portrait sketches by Maclise which appeared in *Frazer's Magazine* from 1830 to 1838 have been collected and published with the original notices, which were chiefly from the pen of the well-known Dr. Maginn. There are nearly 230 portraits, and among them we find many of still living celebrities—of Earl Russell, Carlyle, and Buckstone, for example. They illustrate a brilliant intellectual epoch in the history of England, and are particularly valuable as having

appeared just before the age of photography, for Daguerre's process was not published until 1839. The *Daily News* in describing the collection remarks that "poor Maginn's notices, once considered so brilliant and witty, are chiefly valuable at the present day as illustrating the better taste which now prevails among writers and readers. However much he disliked his politics, no journalist would now wish or dare to allude, twenty years after his death, to a man as great as Sheridan as 'the red-snouted author of the *School for Scandal*,' and Maginn's praise was often so fulsome as to be almost more objectionable than his abuse."

One of the last acts of King Amadeus of Spain was to found a National Chalcographic Institute for the promotion of the art of copper-plate engraving in Spain. It was proposed that the old plates belonging to the State should be reprinted, that all the most celebrated pictures of Spanish masters should be engraved by the best artists, and that a collection should be made of the portraits of distinguished Spaniards. The scheme, owing to the disturbances that have since taken place, has not been very thoroughly carried out, but several plates have been issued which are to be had at a low price. For instance the celebrated "Las Meninas" by Velasquez costs only 6 fr., and "The Virgin appearing to St. Ildefonso" by Murillo 10 fr.

Peter Janssen, of the Düsseldorf school, has recently finished some large wall-paintings in the Rathhaus at Crefeld. These paintings have for their subject the victories of the Germans over the Romans.

A series of articles on "The Galleries of Rome," translated from the Russian of Ivan Lermolieff, commences in the October number of the *Zeitschrift für bildende Kunst*. The writer begins with the Borghese Gallery, and gives us a learned dissertation on a few of the paintings of the early Italian schools, especially pointing out the difference in the painting of hands and ears of some of the masters of the fifteenth century. Other articles in the number are—"Johan Josefsz van Goyen," by Dr. C. Vosmaer; "The Vienna Exhibition," by Jacob Falke; and "The Loan Exhibition of the Paintings of Old Masters at Vienna," by Dr. O. Eisenmann. The illustrations are especially numerous and good.

A monument to the German philosopher Ludwig Feuerbach has recently been set up in the old churchyard of St. John, where Dürer and many other distinguished Germans of past times lie buried.

An industrial institution formed on the plan of the "Conservatoire des Arts et Métiers" at Paris, and the "Musée de l'Industrie" at Brussels, has been founded at Vienna as a lasting memorial of the World Exhibition. It is intended to promote the artistic education of workmen and artisans, and has already a large library.

The Berlin correspondent of the *Daily News* describes the interesting collection of books and pictures illustrative of the late war which has recently been exhibited for charitable purposes in that city. The printed matter is very complete, consisting not only of the larger and graver works, but also of all the journals of Europe and America to the end of the second siege, including the tiny sheets which poured out in such numbers during the existence of the Commune. The collection of caricatures, nine-tenths of them French, is said to be quite complete. The pictures are chiefly photographs, but there is a large set of coloured lithographs, and a few etchings. The lithographs have enjoyed a wide popularity in Germany.

### New Publications.

ARCHIBALD CONSTABLE and his Literary Correspondents. A Memorial; by his Son, Thomas Constable. Edinburgh: Edmonston and Douglas.

## Physical Science.

Reprint of Papers on Electrostatics and Magnetism, by Sir William Thomson. Macmillan. 1872.

It is no slight credit to British science that it claims two out of the half dozen mathematicians of the highest order who have developed the general theory of the distribution of static electricity, since it left the hands of Poisson. The Essay of the first of these writers, Green, in consequence of its having been published by subscription at Nottingham, obtained no immediate notice even in England. No allusion to its results is to be found in treatises on the same subject in the next following years, for example in Whewell's article in the *Encyclopædia Metropolitana* or in Murphy's work. The great importance of Green's Essay seems to have been first recognized by Sir W. Thomson, who brought it into general notice, both in England and on the Continent, by causing it to be reprinted in Crelle's Journal. Indeed Thomson had independently discovered some of Green's results before he had obtained a sight of the Essay. All the scattered memoirs of the first great mathematician and those of the second on electrostatics and magnetism have now been reprinted in single volumes and thus rendered more accessible. The reprint with the above title contains Thomson's articles on electrostatics and mathematically allied subjects which originally appeared in the *Cambridge Mathematical Journal*, the *Cambridge and Dublin Mathematical Journal*, Liouville's *Journal de Mathématiques*, the *Philosophical Magazine*, Nichols' *Cyclopædia*, the *Reports of the British Association*, the *Transactions or Proceedings of the Royal Societies of London and Edinburgh*, the *Royal Institution of Great Britain*, the *Philosophical Societies of Manchester and Glasgow*, and the *Comptes Rendus* of the French Academy.

It includes also Liouville's note appended to Thomson's memoir on electrical images. It is difficult to convey to those who have not studied Thomson's writings any adequate conception of their great and varied excellence. The memoirs of mathematicians on nominally physical subjects have frequently little or no connexion with actual nature and are not confirmed by any verified results. On the other hand many an experimentalist, from want of mathematical training, neglects circumstances which largely influence his inquiry, and either arrives at no definite conclusion, or at such as can be only approximately true under special circumstances. With no class of physicists has this latter defect been more common than with electricians. A large number of articles on electrometry are from this cause valueless. Even where some sort of mathematical reasoning is employed, as for example in Lord Mahon's work, these experimenters are unconscious that their problems required a far more elaborate analysis. In Professor Thomson's writings we find, however, the combination of the highest mathematical talent with ingenuity in devising new instruments of research and precision in their use. Others have been content with measures expressed in the arbitrary scales of their instruments, but Thomson is one of the very few who obtain absolute measures involving only the primary units of time, length, and mass.

A large part of his collected memoirs consists of mathematical results which cannot be referred to without a free use of mathematical symbols. All that can perhaps be attempted in the limited space of a review is to notice some of the simpler formulæ which would first engage the attention of a student. An elementary subject which is here much simplified is that of finding the attraction of a spherical shell on an external point. The expressions for the differential elements of a surface here used may be also applied to calculate the potentials of spherical shells either for an internal or an external point. They also supply a proof, clearer perhaps to a beginner than that in the *Principia*, of the theorem which forms the foundation of electrostatics, namely that a spherical shell exerts no attraction on an internal point if the law of force be that of the inverse square of the distance. These differentials are also important in this subject from the fact of Gauss having employed them to prove a formula subsidiary to his proof of the important theorem, that if the potential have a constant value over a closed surface, it will also have the same constant value throughout its interior. A student of the present day must not think of entering upon the study of the laws of electricity without previous acquaintance with the doctrine of potentials. Most of the laws of the distribution and motion of electricity cannot be expressed in other terms. The simplicity of the formulæ which Thomson has obtained, for the mutual force and for the quantities of electricity upon two influencing spheres charged to given potentials, suggests the thought that there may exist comparatively simple formulæ for the densities in terms of the potentials. At all events, if it be considered how difficult is the practical use of the proof plane, and how elaborate are Poisson's expressions for the density in the case in question, it would seem preferable to regard the force and the quantities as subjects for experimental verification rather than the element which Coulomb measured. To show how this might be done would, however, require far more space than can be here allowed.

The reviewer must in conclusion enforce the necessity of the study of this and the promised reprints of Sir W. Thomson's memoirs upon all who wish to be acquainted with the present state of electrical science.

It is a subject which recommends itself to those interested in mathematical physics from the circumstance that the

various theorems of Green, Thomson, Gauss, Kirchhoff, and others are in harmony with each other and form a consistent body of doctrine.

JOHN A. DALE.

### Notes on Scientific Work.

#### Chemistry.

**The Chlorides of Molybdenum.**—An interesting paper on these compounds, by L. P. Liechti and B. Kempe, is printed in the *Annalen der Chemie*, Band clxix, Heft 3, just published. In some respects their results differ from those of Blomstrand. They are still engaged in the investigation of the oxychlorides of this metal, of which they have found at least four. Of the chlorides the pentachloride, the  $\text{MoCl}_5$  of Berzelius and Blomstrand, is produced by the action of chlorine on the pure metal when air is absolutely excluded. Brownish red vapours are the result of the action, and these condense to form black crystals. It readily melts and, provided air has no access to it, does not exhibit the green colour which Debray noticed. When heated in the air it is converted into the oxychloride  $\text{MoO}_2\text{Cl}_2$ . The trichloride is formed from the pentachloride when it is heated in a stream of dry hydrogen; the tetrachloride by heating the trichloride in a current of carbonic acid:

The tetrachloride is as readily changed in contact with air as the pentachloride. The dichloride is a dull yellow powder, which undergoes no change in air. From a solution in hydrochloric acid it separates as a hydrate in brilliant yellow needles. The existence of a hexachloride is very doubtful.

**The Atomic Weight of Molybdenum.**—A paper by L. Meyer on this subject appears in the same number of the *Annalen*. By four totally different lines of investigation he has been led to a number ranging between 95.6 and 95.8 for the atomic weight of this metal, a number very nearly six times that of oxygen, as determined by Stas. His conclusions accord with Dumas and prove the number 92, in use before his research, to be erroneous. He traces the following relations between the atomic weights of the three groups of metals given below:

Vanadium . . . . . 51.2	Chromium . . . . . 52.4	Copper . . . . . 63.3
Difference = 43.0	Difference = 43.2	Difference = 44.4
Niobium . . . . . 94.0	Molybdenum . . . . . 95.6	Silver . . . . . 107.7
Difference = 88.0	Difference = 88.4	Difference = 88.5
Tantalum . . . . . 182.0	Tungsten . . . . . 184.0	Gold . . . . . 196.2

The atomic weight of molybdenum was not correctly determined so long as it was only calculated from experiments on the reduction of molybdic acid.

**The Volumetric Method of Determining Ammonia.**—Rüdorff in a short paper in *Pogg. Ann.*, 1873, No. 7, 379, directs attention to the difficulties often attending the carrying out of this process through the irregular manner in which the alkaline solution boils, especially when it happens to contain in addition a substance which forms a precipitate with potash. In such cases he modifies the process by passing a current of steam into the solution, and in this way easily succeeds in removing the ammonia. 1.194 grammes of the crystallized double salt of the double chloride of copper and ammonium yielded ammonia corresponding to 1.192 gramme of the salt.

**The Freezing of Alcoholic Liquids.**—Melsens has made some experiments (*Naturforscher*, 1873, No. 39, 368) on the effect of low temperatures on brandy and wine, and his results accord completely with those of Horraath, who noticed an unexpectedly slight degree of sensation of cold in alcohol which had been exposed to a low temperature. Melsens finds that when brandy is cooled to 20° and even 30° or 35° below zero, it can be swallowed without any discomfort, provided only it be taken from wooden vessels. At 30° it is viscid and opalescent, and contains about 50 per cent. of alcohol. At -40° or -50° the strong alcoholic liquid becomes a solid, and if placed in the mouth in this state the pasty mass as it melts on the tongue appears less cold than ordinary ice. It has to be cooled to -60° to produce any impression of cold, and then is but rarely accounted very cold. The coldest portion prepared by Melsens had a temperature of -71°, and this produced in the mouth a sensation resembling that experienced on taking a spoonful of hot soup. He also describes the effect of great cold on effervescing wines.

**The Electric Discharge in Air.**—By allowing a series of sparks from an electro-magnetic induction apparatus to be discharged between platinum electrodes in perfectly dry air Böttger (*Chem. Centralblatt*, 1873, No. 32) noticed the formation of yellow vapours after the lapse of a few minutes; nitrous acid was recognised by the smell. If the sparks be passed through very moist atmospheric air, if the sides of the glass vessel in which the experiment is conducted be moistened with distilled water and some be allowed to collect at the bottom, no yellow vapours are formed, but the air in a few minutes acquires the characteristic odour of ozone, while in the water the presence of hyponitric acid can

be detected. Iodide of potassium and starch paper, the test in common use for the detection of ozone in air, is seen then to be an untrustworthy reagent, as it must in many cases be turned blue by nitrous acid. It behoves meteorologists then, now that their attention has again been directed to these facts by Prof. Böttger, to ascertain the exact conditions of moisture under which the acid is produced, and to establish a process for the estimation of ozone which shall be of absolute certainty.

#### Botany.

**Composition of Fungi.**—The Russian Agricultural Commission for the Vienna Exhibition has published some analyses of edible fungi made under the superintendence of Prof. Nicolas Socoloff. They may be compared with that given by Prof. Church for *Lycoperdon giganteum*, which is also edible when young (see the *Academy*, 15th September, 1873, 353). The following are the results for three species of *Boletus* :—

	<i>B. edulis</i>	<i>B. edulis</i>	<i>B. annulatus</i>	<i>B. scaber</i>
Water . . . . .	11.52	11.50	12.34	13.49
Ash . . . . .	7.36	6.52	7.56	7.90

The composition of the ash was :

	<i>B. edulis</i>	<i>B. edulis</i>	<i>B. annulatus</i>	<i>B. aurantiacus</i>
Phosphoric acid . . . . .	25.06	26.08	21.74	20.27
Sulphuric acid . . . . .	12.97	8.42	—	—
Iron sesquioxide . . . . .	1.63	.98	.53	1.11
Manganese proto-sesquioxide . . . . .	2.22	2.41	—	—
Lime . . . . .	1.00	5.95	—	—
Soda . . . . .	3.60	.87	3.99	1.65
Potash . . . . .	50.37	57.76	58.10	56.09
Sodium chloride . . . . .	3.11	3.55	—	—

The proportion of nitrogen varied in dried specimens from 6.63 to 7.56 per cent.; the average percentage of phosphoric acid was 1.7 per cent.

**Phyllotaxis.**—Dr. Airy in a paper read before the Royal Society describes a mechanical contrivance by which the terms of the common phyllotactic series can be shown to be derivable from one another by a process of condensation. Moreover he arrives at the conclusion "that the necessary sequence of these successive steps of condensation, thus determined by the geometry of the case, does necessarily exclude the non-existent orders one-fourth, three-sevenths, four-elevenths, &c." This conclusion Prof. Beal has shown (*American Naturalist*, August, 1873) to be "an incorrect theory," inasmuch as he finds the phyllotaxis of many cones of the Norway spruce to be eleven-twenty-ninths, which is a term of Dr. Airy's impossible series.

**Hydnora Americana.**—The genus *Hydnora* includes a number of extremely remarkable root parasites; they are with one exception found only in Africa. Two species occur at the Cape; a variety of one of these was met with by Welwitsch in Angola, and a second Angolan species has been recently described by Decaisne (*Bull. de la Soc. Bot. de Fr.*, 28th March, 1873). Beccari found two species in Abyssinia (*Nuovo Giorn. Bot. It.*, 1871, 5), while a third from the same locality is described by Schimper. Sabatier also found a species, which Decaisne holds to be distinct, at the sources of the White Nile. In the African type the staminal column is annular and the placentas are pendulous. In the solitary American species, first discovered in Southern Brasil by Tweedie, the staminal column is solid, and the ovules are immersed in radiating plates which form parietal placentas. These terminate above in a truncate mass forming the stigma and constituting the floor of the perianthial tube. The fertilisation of this extraordinary plant is effected by small beetles, which crawl through three apertures beneath the staminal column, attracted probably by some secretion from the small glandular bodies which stand immediately below them. Robert Brown failing to find pendulous placentas, and not appreciating the complete significance of the radiating plates, described Tweedie's specimen as dioecious, in which he was in error. But a more curious misapprehension of the structure of the plant was fallen into by Mr. Miers, who in the September number of the *Journal of Botany* gives a description of the upper half of a flower collected by himself in 1826 near Buenos Ayres. He regards the glandular bodies above mentioned as the placentas, which in his specimen were really altogether wanting. De Bary has published an account in the main correct of this extraordinary species in the *Abhand. der Naturf. Gesellsch. zu Halle*, 1868, and at the first meeting of the Linnean Society on the 6th instant Dr. Hooker gave the results of an examination of the specimen in the Kew Herbarium which had originally been in the hands of Robert Brown.

**New American Cytinus.**—In the *Botanische Zeitung* for 1872, p. 709, tab. 8, Eichler described a new genus of *Balanophoraceae* under the name of *Bdallophytum*, including two species both American and both known only as male plants. One of these, *B. Andrieuxii*, is undoubtedly identical with the *Cytinus americanus* of R. Brown. The other is also a *Cytinus*. Eichler in a short note appended to the last and concluding part of De Candolle's *Prodromus* admits the affinity of these plants with *Cytineae* and probably with *Cytinus*, and promises the publication of some further details respecting them.

**Bacteria.**—In the *Quarterly Journal of Microscopical Science* for October, Prof. Lister describes some observations which he believes prove the origin of Bacteria from fungi. A fungus made its appearance

in some milk with which he was experimenting; it consisted of delicate branching filaments bearing conidia characterised by a raw sienna tint. Besides the ordinary process of germination and a toruloid pullulation, the conidia were often seen to give off exquisitely delicate threads. Among the filaments free bodies, exactly resembling in form, size, and refractive power portions of these delicate sprouts, were observed. Some of them were seen to be branched, and though in this respect they deviated from the most typical form of bacteria, their bacteric nature was placed beyond doubt by characteristic movement observed on several occasions. — In the same Journal Mr. Lankester describes a peach-coloured bacterium which made its appearance in water containing decomposed animal organisms. The characteristic pigment enabled him to correlate a number of entirely different forms as belonging to the same physiological species which have been held hitherto by Cohn and others to be distinct.

The sixth volume of Bentham's *Flora Australiensis* includes the orders from *Thymelæe* to *Dioscorideæ*. *Thymelæe* include the endemic Australasian order *Pinuleæ*, with 67 species. *Nepenthes*, a characteristic type of the Indian Archipelago, is represented by one species in Queensland. *Euphorbiaceæ* is represented by 37 genera, 14 of which are endemic. Bentham separates *Calycocephalus* from *Euphorbia*, though on different grounds to Baillon, who considers the flower heads as heads of flowers in the former and as single flowers in the latter. *Casuarina* has 19 species, of which all but *C. equisetifolia* are endemic. There is one species of *Balanophora* in Queensland found also in the New Hebrides. Of *Coniferae* the 11 Australian genera are all limited to the southern hemisphere except *Podocarpus*. If one may call attention to a not very important error, *Arthrotaxis* is a common but unauthorized name for the genus called by its founder, Don, *Athrotaxis*. The Australian *Orchidæ* contain 48 genera, which geographically may be divided into two groups. Twenty-eight genera, comprising one-third of the total number of species, including the whole of the tribes *Malaxideæ*, *Vandeæ*, *Bleideæ*, *Arethuseæ*, the first group of *Neottideæ*, and the *Ophrydeæ*, belong to the tropical Asiatic Flora, represented in Australia by endemic or frequently by identical species; none of these are found in W. Australia. The remaining 20 genera, comprising two-thirds of the species, are essentially Australian, belonging to three Australian groups of *Neottideæ*.

**Passage of Gases through Vegetable Colloidal Membranes.**—A. Barthélemy has experimented (*Compt. Rend.* lxxvii, 427) upon the dialysis of carbon dioxide, nitrogen, and oxygen through the thin elastic faded leaves of certain species of *Begonia*. He finds that the natural colloidal surfaces of plants permit the transpiration of carbon dioxide at a rate thirteen to fifteen times more rapid than that observed when nitrogen is used and six to seven times more rapid than in the case of oxygen. When the gases are dry the disproportion in the rates of passage is reduced. The results were not very different from those obtained by Graham with caoutchouc membranes.

**Sensitiveness in the Leaves of *Drosera*.**—At the recent meeting of the British Association at Bradford a paper was read by Mr. A. W. Bennett on the Movements of the Glands of *Drosera*. The glands which cover the margin and upper surface of the leaves of the sundew have the power of imprisoning insects that alight upon them by means of a thick viscid secretion which they exude. After the insect has become completely entangled in this secretion, the glands from all parts of the leaf begin to converge towards it, every gland ultimately pointing the knob at its extremity towards the imprisoned insect, which they apparently consume and digest. It appears from a series of experiments made by Mr. Bennett that raw meat is acted upon by the glands of the leaf in precisely the same manner as a fly, though rather more slowly; while a non-nitrogenous organic substance like a piece of wood, or an inorganic substance, undergoes no change. From the time which elapses after the first contact of the insect before any considerable movement of the glands takes place, it seems that it is not due to the mechanical irritation caused by the struggles of the insect.

**Dimorphism in Flowers.**—Dr. Hermann Müller, of Lippstadt, is publishing a series of articles in *Nature* in which he offers a somewhat new interpretation of the different form and colour sometimes exhibited by the flowers belonging to different individuals of the same species. He illustrates this especially in the case of three plants: *Lysimachia vulgaris*, *Euphrasia officinalis*, and *Viola tricolor*, in each of which there are two well-known forms, one with larger and brighter, the other with smaller and less conspicuously coloured flowers. Dr. Müller shows that these are accompanied by other structural differences, relating especially to the position and arrangement of the stamens and pistil, which clearly point to contrivances for different modes of fertilisation; and this again corresponds to differences in the localities where the two forms occur spontaneously. In the case of *Lysimachia vulgaris* the form with the larger and brighter flowers grows in open, sunny situations, and is abundantly visited by insects, while the form with the smaller, less brightly coloured flowers is found in more shady situations, where there are very few insects, and is apparently generally self-fertilised. These differences in the size and form of the flower have frequently occasioned the

division of a species into well-marked varieties; and even, as in the case of *Rhinanthus*, into two distinct species *R. Crista-galli* and *R. major*.

### Geology.

**A New Fossil Ape.**—M. Delfortrie describes (*Actes de la Société Linnéenne de Bordeaux*, 1873, vol. 29, part i.) the osteological characters of the cranium of a new species of fossil ape belonging to the family of the Lemurs, found by M. Bétulle in the phosphate beds of Sainte-Néboule de Bédier, Lot, France. The skull, which is entire, is of an elongated conical form, and represents an adult individual. The occipital crest is slightly projecting, but wide in consequence of the development of the mastoids. The parietals are very spreading, constituting nearly the whole of the cerebral arch. The temporals are flat, elongated, and exceed in height the half of that of the orbits. The frontal depressed, bearing a keel upon the median line. The orbital circle is closed, of nearly oblique oval form, strongly inclined towards the nose. The nasal bones are very elongated, slightly raised on the median line, and inclined on their exterior edge towards the junction with the maxillaries. The cranial characters are remarkably similar to those of the *Lori grise*, but the dental system shows it to belong to an entirely new genus of the *Makis* family. With the exception of the principal and the two right hind-molars, all the teeth were broken off by the workman's pick, but the roots of all of them, with the exception of the incisors, are adherent to the alveolæ, which are still intact, so that on allowing the normal number for the incisors, the series is found to be as follows: incisors two, canine one, premolars four, principal molar one, hind-molars two. An insectivorous character is displayed in the sharp denticulation of the preserved teeth. To this fossil M. Delfortrie assigns the name of *Palæolemur Bétullei*. While his paper was in the press M. Delfortrie received from the above locality a right mandible belonging to an individual of the same species. He has since forwarded both specimens to M. Albert Gaudry, who recognises in them many affinities with the Eocene or Miocene pachyderms, and traces a specific identity between the new fossil and *Aphodotherium Duvernoyi*, Gervais, and *Adapis parisiensis*, Cuvier, both from the Paris gypsum; as well as with the *Adapis* from Barthélemy, near Apt.

**New Observations on the Dinocerata.**—By obtaining many additional remains of the order Dinocerata from the collection of the Yale College Expedition, Prof. O. C. Marsh has been enabled to clear up some doubtful points regarding their structure. The dental formula, so far as it is now known, is as follows: incisors 2; canines 1; molar:  $\times 2$ ; = 34. The premaxillaries are not united in front. The lower jaw presents no proboscidean features, but resembles that of the *Hippopotamus*, more especially in the downward extension of the rami below the diastema. It is extremely probable that both sexes were provided with horns. It is possible that some only of the osseous protuberances of the skull supported true horns. The manus had five toes with moderately elongated metacarpals. There were four toes in the pes with short metatarsals. The characters of this order include marked perissodactyl, artiodactyl, and proboscidean features, the last of which is the least developed. The geological horizon of all the animals of this group is Upper Eocene. A new species of *Dinoceras*, named by Marsh *D. laticeps*, is represented by a nearly perfect skull with entire lower jaw, and various other parts of the skeleton. It differs from *D. mirabilis* in the greater proportionate width of the skull, the shorter and more massive posterior horn-cores, and the more compressed and prominent nasal cones. The entire length of skull is thirty-three inches. The distance between the outer faces of the occipital condyles is 7·8 inches, across the zygomatic arches 13·5 inches. The lower jaw measures 11·6 inches between the outer ends of the condyles, and its length from condyle to front of symphysis is 20·8 in. The canines of the lower jaw are smaller than the last incisor and slightly separated from it. The incisors decrease in size the farther they are removed from the symphysis, and are all directed well forward. (*American Journal of Science*, No. 34, vol. vi. (3) p. 300.)

**Geological Map of Australia and Tasmania.**—Geological surveys of the Australian colonies have now been in progress for several years, and in Victoria especially the work has been carried on systematically and with great success. The main features of the surface geology of the country are comparatively well ascertained, and it has occurred to the Government of Victoria to endeavour to embody in a general map the results of all the work done up to the present time. In response to an application of the Minister of Mines in Victoria to the Governments of the other colonies an abundance of material has been placed at the disposal of the Mining Department. This has been thoroughly arranged by Mr. R. Brough Smyth and is now, together with the geological sketch map of Victoria, compiled by the same hand, being incorporated into one general map. The New South Wales Government have in preparation a map of their colony which will probably be ready for use sooner than the general map. Some of the more important points established by these surveys are as follow. A great metalliferous belt exists on either side of the main Cordillera extending from Cape Yorke to Tasmania, consisting chiefly of metamorphic schists and granite rocks, covered over large areas by the newer palæozoic and mesozoic coal-bearing strata.

Another great belt extends from Encounter Bay, S. Australia, towards the Gulf of Carpentaria. Parts of the country between 30° and 23° S. lat. consist of tertiaries, and rocks which Mr. Daintree considers to be of cretaceous age. The coal-rocks extend along the coast from Port Curtis, in Queensland, in an almost unbroken line to Eden or Twofold Bay, and are especially prominent at Wollongong and Newcastle in New South Wales. In the Tertiary era Tasmania was united to the mainland. The strict resemblance between the geology of Tasmania and the continent, and the fact of the chain of granite islands, extending from Wilson's Promontory to Cape Portland, being all capped with tertiaries, place this beyond doubt. An immense area of Western Australia is occupied by granitic rocks, with occasional patches of sandstone on the southern coast-lines, while a comparatively small belt of metamorphic rocks occurs to the east of Champion Bay. Below the volcanic rocks in Queensland as well as at Ballarat, the deep leads occur, which in the former colony contain tin as well as gold. To facilitate the rapid identification of the rocks a system of lettering is coupled with the distinctive colours of the various periods. (Condensed from the *Melbourne Argus*, 7th June.)

### History.

Huber on the Jesuit Order. [*Der Jesuiten Orden nach seiner Verfassung und Doctrin, Wirksamkeit und Geschichte characterisirt.* Von Dr. Johannes Huber.] Berlin.

It is hardly possible that a really impartial history of the Jesuits should be written at the present day or for some time to come. No one sufficiently interested in the subject to care to undertake the work could well fail to have a very decided bias for or against the Order, which must inevitably, however unconsciously, colour his estimate of facts. But it is quite possible to be painstaking and conscientious in the statement of facts and citation of authorities, and Professor Huber, who of course makes no secret of his own opinions, may fairly claim this praise. The hundredth anniversary of the Suppression of the Jesuits by Clement XIV., coinciding as it does curiously enough with their expulsion from the German Empire, has suggested to him the idea of drawing up this sketch of their "teaching, work, and history" during the two centuries which elapsed between the formal institution of the Order and its abolition. He fully admits the difficulties of his task, as well from the bewildering multiplicity of materials as from the vehement prejudices which beset the subject on every side. And he very naturally insists on the intimate connection between the Jesuit Society and the modern development of the Papacy, which made it impossible that such half measures as that of Ganganelli, should have any permanent effect. As he himself words it "the so-called Catholic Church of to-day bears the indelible stamp of Jesuitism, which is simply Papism carried to its logical extreme." Ultramontanes would have no quarrel with him as to the matter of fact. And he is only consistent with himself in looking with little satisfaction on Bismarck's anti-Jesuit policy, and that for two reasons: it is not by civil legislation from without, but from within the bosom of the Church alone, that any genuine reform can be effected, and moreover such rough and ready methods of undermining the influence of the Roman Church tend to foster indifference and atheism, and thus to undermine the civilised State itself. But these are *obiter dicta*. The object of the work is not to discuss the problems of the present day, at least directly, but to trace the history of the past. In successive chapters the author treats of the foundation and constitution of the Society, its external action at home and in foreign missions, its ecclesiastical policy, moral and theological teaching, and educational career. Two final chapters are devoted to the Jansenist controversy and the history of the Suppression of the Order under Clement XIV. This mere enumeration is enough to show the wide range of subject-matter compressed into a treatise of under 600 pages, every chapter of which might easily be expanded into a separate volume. There is however a peculiar convenience in having a trustworthy digest in so accessible a form, and it is remarkable that, in all the vast literature, friendly and hostile, which has grown up around the Society, nothing of the kind previously existed.

Born in Spain, "the classical home of the Inquisition," the Jesuit Order bore from the first the impress of the military and despotic character of its great founder, which may be traced alike in the "Spiritual Exercises," the constitution, and the fourth vow, superadded to the three common to all religious Communities, binding its members to accept at once and unconditionally any mission imposed on them by the Pope for the propagation of the faith or good of souls. The principle of "blind obedience," more or less recognised in every monastic Order, received at the hands of Ignatius Loyola a quite exceptional development, involving the absolute surrender both of the intellect and the will, and became the mainspring of the entire system of discipline and teaching of which he is the author. It gave to his Society, which was to be a sort of microcosm of all the Orders in the Church, its speciality as a political engine, which has proved a chief source alike of its influence and of the intense distrust it has provoked in Catholic no less than in Protestant countries, and formed at once the weakness and the strength of its educational method, which was studiously adapted to sharpen the intellect within certain prescribed limits, while sternly repressing independence of mind and character. The Order has been vehemently assailed and as warmly eulogised both in its intellectual and moral aspects, and in neither case without reason. Dr. Huber frankly recognises the eminence of some of its great writers, such as Mariana—the greatest perhaps, but the least distinctively Jesuit, of any of them—while he condemns the scientific and educational system as a whole. Thus again he cites some truly marvellous illustrations of Jesuit ethics, to say nothing of "Marian" theology which recalls the most startling extracts in the *Eirenicon* and Dr. Newman's Letter upon it; but he also acknowledges, what all honest critics would allow, the irreproachable moral character which the individual members of the Society have usually maintained, though there have of course been exceptions—some very gross examples are referred to here—both in its earlier and later history. It is indeed only due to the Jesuits to say that they owe their long term of power in great measure to that continued freedom from internal corruption, and strict fidelity to their rule, which has honourably distinguished them from almost every other religious community in the Church, and has, as was natural, counted heavily as a makeweight against many grave charges of other kinds. The record of most Orders is a succession of declensions and reforms, but there has been no "reform" of the Jesuits. On the other hand they have been conspicuous for their hostility to the older Orders, and are generally in bad odour with them. What may at first sight appear more strange, they have frequently been in antagonism with the Popes, towards whom they acted much in the spirit of the praetorians, who jealously maintained the absolute prerogatives of the Roman Emperors against all dictation except their own. From Paul III., who first approved the Order, to Clement XIV. there were few Popes they did not resist or disobey. To take but a few instances out of many here cited: when Paul V. threatened to condemn their doctrine of grace, Aquaviva, the General, replied, "If your Holiness casts this slur on the Order, I will not answer for it that 10,000 Jesuits will not seize their pens to attack the Bull in writings which will compromise the Holy See." For a century they continued to set at defiance the commands and censures of the Holy See in the famous controversy about the toleration of Pagan customs and ceremonies in China, till Benedict XIV. at last reduced them to submission. When Innocent XI. condemned several propositions of Jesuit theologians, they denounced him as a Jansenist, and prayed publicly for his conversion in the churches at Paris. They maintained their corporate existence in Russia and Prussia, under the pa-

tronage of Catharine and Frederick the Great, after the abolition of the Order by Clement XIV., in spite of censures and excommunications, and in a Jesuit work published in 1814, *Gloria Posthuma Societatis Jesu*, we are informed that "the Empress Catharine availed herself with much prudence of the right all sovereigns have to make their people happy, by forbidding the Jesuits to obey the Pope." And so it came to pass that "the number of members of the Order at the date of its restoration (in 1814) was almost as large as before its suppression," in 1773. There is no need to doubt that in this and in other cases, where their policy is even less excusable, the Jesuits were acting in accordance with what they believed to be the best interests of the Church; but it shows how completely they had learnt to identify those interests with their own.

It must however be borne in mind that the counter reformation of the sixteenth century, in which the disciples of Loyola played so conspicuous a part, was not merely, as Dr. Huber seems to imply, an ultramontane reaction against the reforming tendencies of the age, whether within or without the Church; it was also an instinctive recoil of the Christian conscience from the returning tide of Paganism. The Reformation may have been, in one sense, a religious necessity; certainly for centuries before, and above all during the fifteenth, the cry for a reform had been waxing louder and louder throughout the Church. But its religious side was an accident of the actual movement, not its essence, and its theological influence was almost exclusively destructive; what positive teaching it maintained was pieced together, often clumsily enough, from shreds of the discarded faith. The Reformation was in fact but one phase of a much wider movement of human thought, at once retrograde and revolutionary, first manifested in the Renaissance and culminating in the principles of '89. That movement was essentially naturalistic, and its force is far from being spent yet. The growing anti-supernaturalism of our own day is a phenomenon which can hardly fail to strike even the most moderately attentive observer of contemporary modes of thought, though it does not of course often find such frank, not to say coarse, expression as in Swinburne's poetry. This revived Paganism the Jesuits from the first set themselves to oppose,—often no doubt with very questionable weapons,—and in fighting the battle of the Papacy they felt themselves to be contending against fearful odds in the cause of positive Christian belief. Of their immediate success, in preserving or reclaiming large portions of Europe for Catholicism, there can be no question; but as to the ultimate results of their policy, and still more as to the means employed in carrying it out, there is the widest divergence of view, while there remain several disputed questions of fact on which it is difficult or impossible to pronounce absolutely without further evidence. Thus it may be asked, how far they were exactly responsible for the Thirty Years' War, which Gfrörer says "was at least half their work," while Döllinger speaks still more strongly. There is the controversy about the famous "Reductions of Paraguay," which have gained them such high panegyrics from Protestant writers, like Southey, as well as from their own partisans, but about which Huber shows, by the most unimpeachably Catholic testimony—including that of Pope Benedict XIV.—that a devil's advocate would have a good deal to say. Then again the much vexed question about the death of Clement XIV. is one which seems hardly likely now ever to receive a decisive solution. On the one hand it is quite possible to account for his end by natural causes, and the official report of his physician, Salicetti, was given in this sense; on the other hand, while there is a conflict of medical testimony, there is abundant evidence that Clement believed himself to be poisoned, and this was a very prevalent

opinion at the time in Italy and Spain, and Cardinal De Bernis, who speaks with caution, implies that such was his own belief. If this were so, however, it would still remain to be proved, how far the Jesuits, as a body, or individuals among them, were implicated in the crime. Huber sums up by observing that "a dark mystery hangs over the death of Clement XIV., and the veil is not yet lifted"; probably it never will be.

The two longest chapters in the book are devoted to the religious teaching and practice of the Order, and its educational activity. The first of course brings before us the whole subject of "probabilism" and Jesuit casuistry in general, immortalised by Pascal, as also the startling doctrines about particular subjects, such as tyrannicide—especially of heretical sovereigns—papal absolutism, persecution, and the like, maintained by many of the leading Jesuit divines, and the famous controversy about grace. This chapter will repay careful perusal; it clearly illustrates an extreme laxity of moral teaching on many points, notably as regards truth and falsehood, and an habitual tendency to multiply fanciful, if not superstitious, forms of external devotion; but into these details we need not enter now. The educational success of the Society during the first 150 years of its existence, when it practically controlled the whole higher education of Catholic Europe, was something marvellous. Within less than a century of its foundation it counted 467 colleges and 136 seminaries—for the training of the clergy also passed to a large extent into its hands—and in 1710 the Jesuits are said to have held the chairs of Theology and Philosophy at 80 universities and to have had 612 colleges and 157 normal schools; in 1750, when the tide was beginning to turn against them, there were many hundred Jesuit schools in France alone. Catholic and Protestant authors vie with one another in bearing witness to their triumphs in this domain. Professor Huber fully admits, with the late Mr. Buckle, that in the sixteenth century they were greatly in advance of their age, though in the eighteenth they had fallen behind it, and he emphasises the common indictment against their system of tending to repress the critical faculty and discourage original inquiry and independence of mind. It is remarkable in this connection that they should have manifested from the first an aversion to Church history, which found no place even in their theological curriculum, and was usually treated by Jesuit writers, when they touched upon it, in the spirit of special pleaders rather than of simple investigators of truth. It was only in the reformed *Ratio Studiorum* put out in 1832 by Roothan, then General of the Order, that this subject is first directed to be taught. And the ethical was in close harmony with the intellectual discipline of their colleges, in its rigid suppression of personal confidence and friendship among the students through an elaborate system of mutual espionage. As to the ultimate outcome of their teaching Father Theiner, late librarian of the Vatican, gives very condemnatory testimony in his *History of the Pontificate of Clement XIV.* "It is not enemies but sincere friends of the Society who ask how it has come to pass that, while the Jesuits, on coming to Germany, found great theologians among the secular clergy, who boldly made head against the Reformers with conspicuous success, they left none behind them when, through a special dispensation of Providence, they were obliged to quit the country. Since the Reformation, when the Jesuits obtained exclusive possession both of lay and clerical education in Germany, no Christian land has been so poor in Catholic writers of any mark among the secular priesthood." And Möhler's language is even stronger, when he says that "in their hands dogma became a bare skeleton of intellectual notions, while of course their influence on moral theology was very pernicious." Suarez is unquestionably

tionably the greatest name among them as a philosophical thinker, and Maldonatus is their one great name in Biblical criticism; Cornelius a Lapide, though a very laborious writer, stands on a different level, and is chiefly occupied with the allegorical and mystical interpretation gathered from the Fathers and great theologians of a former age. It is remarkable, when the Order was put on its defence, how incapable it showed itself of holding its own in the literary sphere against the impetuous assault of Pascal and his allies, and how little popular sympathy it was able to evoke—though there are exceptions to this—when all the Catholic Governments in succession turned against it, sometimes, as in Spain, with circumstances of extreme harshness or even cruelty. When the Bull *Dominus et Redemptor noster* at length appeared, the only refuge for the scattered members of the suppressed Order was found under the aegis of the schismatic Empress Catharine and the Protestant Frederick of Prussia, who, with characteristic effrontery, directed his agent at Rome to reply to the remonstrances of the Pope that "he had promised to maintain the Catholic religion in his dominions *in statu quo*, and as he was a heretic the Holy Father could not dispense him from his oath or from his duty as an honest man and a king." We have seen already what effective use the Jesuits made of the support proffered them from such unexpected quarters.

Dr. Huber's work, as we have already implied, has more the character of an essay, or rather of a series of carefully condensed essays, on different leading features of the life and system of the Jesuit Order, than of a continuous history, and so far it falls under the designation of a *Zeitschrift*, but one of exceptional interest and which is likely to retain its value for a good while to come. The time for writing a complete history of the Order is not yet arrived.

H. N. OXENHAM.

Renieri on Blossius and Diophanes. [Περὶ Βλοσσίου καὶ Διοφάνου, ἔρευνα καὶ ἐκκασίαι Μάρκου Πενέρη. Ἐν Λειψίᾳ. 1873.] pp. 204. 8vo.

"THE purport of the treatise" which M. Renieri, the director of the National Bank at Athens, has just published, he himself (p. 183) states "is not to furnish biographies of the Gracchi, but to prove that their designs were considerably influenced by two Greek friends of Tiberius Gracchus—the Stoic philosopher Blossius of Cumae and the rhetorician Diophanes of Mitylene—who aimed at remodelling the constitution of the Roman republic according to the ideas of the politicians and philosophers of Greece." The essay (for such it appears to be rather than an elaborate work) is ingeniously worked out, and all points in which the influence of Greek ideas and theories might possibly be traced are skilfully laid hold of. In spite of this, we confess that we are far from convinced of the truth of the author's hypothesis. According to his view, the real merit of the reforms attempted by the Gracchi would seem due to Greek enthusiasts. Of Diophanes we know but very little, but Blossius stands convicted of reckless enthusiasm by joining the hare-brained enterprise of Aristonicus in Asia. And of such a man Tiberius Gracchus is said to have been the mere instrument! We cannot believe it. It is quite possible, nay it is even extremely probable, that the Roman statesman had originally been imbued by his Greek friends and instructors with that philosophical and cosmopolitan training which subsequently enabled him to overstep the narrow pale of Roman conservatism and to judge of the constitution of his country with impartial eyes. But this does not involve the admission that he was merely put forward by these Greek adventurers as a useful tool for carrying out their ideas, just

as if he himself had had no ideas of his own and had obtained them ready-made from his Greek assistants. There is on the contrary clear evidence to show that rather the reverse was the case, and that in all matters of importance the decision rested with Tiberius, and not with Blossius. In the well-known anecdote related by Cicero in his *Laelius* 11, 37 we read: "C. Blossius Cumanus.....cum ad me.....*deprecatum* venisset, hanc ut sibi ignoscerem causam adferebat, *quod tanti Ti. Gracchum fecisset ut quicquid ille vellet, sibi faciendum putaret.*" It does not exactly agree with the ideal and unbending character of Blossius conceived by M. Renieri, that he should come *deprecatum* and ask pardon; but then he throws all the blame upon Tiberius and declares himself merely to have followed his behests. If Blossius was so craven-hearted as to excuse himself in this way, though he must have been conscious of having been the real instigator of Tiberius' plans, let history abide by this, and give the bold man that *did* the thing also the credit of the idea and conception of it. But perhaps Blossius was sincere: we rather think so from what follows. The question being put to him, "Would you ever have set fire to the Capitol, if Tiberius had ordered you?" he boldly replied, "He would never have ordered me, but had he done so, I should have obeyed him." This is again the language of a mere enthusiast, and perhaps the Romans were right in letting him escape. We cannot accept Blossius as the intellectual author of the Gracchan reforms, but we still recommend this treatise to the perusal of others as a specimen of very ingenious combination of isolated facts. Its weakest point is no doubt the attempted reconstruction of the intentions of Attalus in bequeathing his fortune to the Roman nation: there we should say that the author's sagacity almost overreaches itself. The style of this treatise is very pleasing, though sometimes rather in the manner of French novels than of sober historical writing. The revision of the proofs must have been particularly careless, and there are scarcely two consecutive pages without some mistake or other. The author would have got his book printed much better at Athens than at Leipzig, both in point of correctness and of type.

W. WAGNER.

### Notes and Intelligence.

We notice some new arrangements in the historical professorships of certain German Universities. Winkelmann, the author of the best work on the Emperor Frederic II., who has lately published the first volume of the lives and times of King Philip of Suabia and the Emperor Otto IV., has removed from Bern to Heidelberg in the room of Wattenbach, who has accepted a chair at Berlin. At the same time the Prussian Government has at last succeeded in inducing another Heidelberg Professor, Herr von Treitschke, the celebrated popular essayist and spirited patriot, to go to Berlin next Easter. Professor Erdmannsdorfer, one of the editors of the political acts and documents belonging to the reign of the Great Elector of Brandenburg, and author of a life of Count Waldeck, the principal minister of this prince, has exchanged Greifswald for Bresslau, and is to be succeeded in the former place by Ulmann, hitherto at Dorpat, who became favourably known by a life of Franz von Sickingen.

On the 15th October died at Heidelberg A. L. von Rochau, a straightforward and energetic patriot, who in his student days took part in the well remembered Francfort riots of 1833, and shared their melancholy consequences. He saw much of France, Italy, and Spain, and made excellent use of the knowledge thus acquired after he was permitted to return from his exile and travels. His *Geschichte Frankreichs vom Sturze Napoleons bis zur Wiederherstellung des Kaiserthums*, a precise and well meditated abstract of modern French history between 1814 and 1852, was the first work with which the Leipzig publisher S. Hirzel in 1858 started his *Staatengeschichte der neuesten Zeit*. Von Rochau, honest and faithful, was foremost in the group of statesmen and publicists who after 1859 promoted the German National Union, and edited for a considerable time its weekly periodical. He accordingly hailed the great events by which national unity was at length obtained. After having enunciated his doctrine in an important political pamphlet, *Grundsätze der Realpolitik angewendet auf die*

*staatlichen Zustände Deutschlands* (Heidelberg, 1870), he began publishing in parts a popular history of the German people, and is said to have left nearly finished a biography of Count Cavour for a great collection taken in hand by the Leipzig firm of F. A. Brockhaus under the title of the *Modern Plutarch*, the first volume of which is to be expected by the end of the year.

An important meeting was held in Berlin on the 13th October, having been called by the Academy of Science. The hitherto rather unsettled state of the *Monumenta Germaniae Historica* is to be re-founded on a truly national basis, and with a better working organisation than before. The gentlemen who appeared as well for the old as for the new society agreed to form a central direction composed of Austrian, and South and North German historians, with the power of distributing work to the various sections as projected from the beginning by the great originator of a really grand and vast plan, the illustrious Freiherr von Stein. It is expected that Waitz, Wattenbach, Dümmler, Bluhme, Grotefend, Giesebrecht, Ficker, Stumpf, and Sickel will belong to the leading committee.

There has been a long pause in the continuation of Ranke's *Sämmtliche Werke* since vol. 24, a collection of essays referring to general European and Prussian politics, was issued about fifteen months ago. Though the publishers (Messrs. Duncker and Humblot of Leipzig) were pledged to furnish the public with at least four volumes a year, they actually stopped work, and, rather annoying for subscribers, began reprinting vols. 1-6 with corrections and additions by the author himself. It now appears that the veteran historian was pushing on all the time with wonderful activity to fulfil his engagement. We have at last a stout volume of 522 closely printed pages, but a unique specimen even in the German book trade, as it counts for two, viz. vols. 25 and 26. The contents, however, are most welcome, and very *apropos*. Ranke's *Neun Bücher Preussischer Geschichte*, 3 vols., 1847, 1848, had never been reprinted, and to a certain extent required revision. They now appear in a new dress and under a new title, *Zwölf Bücher Preussischer Geschichte*. But instead of adding to what has always been the conclusion of the book, and continuing the reign of Frederic the Great after the year 1748, the additions are made to the beginning, the first book of the former edition being expanded into four books. In fact we have a new introductory work with a distinct title, *Genesis des Preussischen Staates*, and very valuable indeed, as must be everything coming from such a pen. The clue to it is given in a few words added to the original preface. Ranke agrees that the "origines" of Prussian history of late owe much new light to many happy researches. Yet he adds: "By the events of the last years I felt, as it were, invited to point out more extensively than before in what manner the Brandenburg-Prussian state, which to-day has to act such a great part in the European drama, was originated from the beginning, how it succeeded in reaching the place by which it has been enabled to enter the conclave of the European powers." It is, indeed, highly instructive to observe how the territorial element is mixed up from the beginning with the general. Ranke has contrived to supply within the limits of a single volume a lucid account of the colonisation of Brandenburg and Prussia, of the Hohenzollern Electorate from the fifteenth to the seventeenth century, of Frederic William the great Elector, and of King Frederic I. Nobody can say the same of Droysen's long-winded and entirely unreadable book on the History of Prussian Politics, in which the great outlines of the subject are perfectly smothered by the mass of diplomatic details. Two very interesting documents will be found in the appendix of the new work: the political testament of the Great Elector written in 1667, and his original sketch of a project to obtain possession of Silesia, the importance of which doubtless did not escape the sagacity of Frederic the Great in his time.

We have already pointed out the sterling qualities of K. Klüpfel's *Geschichte der deutschen Einheitsbestrebungen bis zur ihrer Erfüllung 1848-1871*, the second and concluding volume of which has just left the press. It is occupied with the last period of decisive development, the period within the limits of two great wars from 1865 to 1871, and well merits its success by accurate research, clearness of style, and broad national views.

## Philology.

Translations by A. C. Jebb. Bell and Daldy.

Tennyson's *Ænæon* translated into Latin Hexameters by T. S. Evans. Bell and Daldy.

ONE feels in turning over a collection of classical translations of the old school, of which perhaps one might take the Marquis of Wellesley's as a fair specimen, that the immense skill and tact displayed in them was not so much the result of literary insight as a substitute for it; the translator was not occupied so much with the spirit of either ancient or modern literature as with the relation between the two. But both in the splendid volume, at once chaste and gorgeous, of the public orator of Cambridge, and in the modest pamphlet of the professor of Greek at Durham, the literary impulse reigns supreme; both translators have been guided by a purely literary preference to favourite poems or passages, and have exercised their power as scholars upon them in the same way as under other circumstances they might have exercised their power as critics.

The greater number of Mr. Jebb's translations have appeared already in the *Arundines Cami*, the *Sertum Carthusianum*, and the *Folia Silvulæ*, but the translations of *Abt Vogler*, Milton's *Hymn on the Nativity*, and Wordsworth's *Ode on the Intimations of Immortality*, which are new, are more important than any of the old translations, except perhaps the very fine rendering of "Tithonus."

It may be questioned whether in a collection of such a character it was worth while to include so many scraps of excellent Greek Iambics; the volume would have had in some respects a higher literary value if it had been confined to poems complete in themselves: which of course does not imply that no poem should have been translated which could not be translated at length, but that no extract should have been taken which could not be turned into a whole in the course of translation. Otherwise the translations are simply admirable, and worthy of the traditions of the university of Porson. The translation from the "Coming of Arthur," which has not appeared before, deserves especial notice on account of the felicity of the anapaests of Merlin's song.

"Rain, rain, and sun! a rainbow on the lea!  
And truth is this to me, and that to thee;  
And truth or clothed or naked let it be.  
Rain, sun, and rain! and the free blossom blows;  
Sun, rain, and sun! and where is he who knows?  
From the great deep to the great deep he goes."

τῆδε μὲν αὐγῶν τῆδε δ' ἄπ' ὀμβρῶν  
κέχυνται πολύχρους ἱρις ἐπ' ἀγροῖς·  
ἔστι δ' ἀληθὲς τοῦτο μὲν ἡμῖν,  
ὡμῖν δ' ἕτερον· σαφὲς οὖν ἔστω,  
κεκαλυμμένον εἴτ' ἀκάλυπτον.  
ἡδὺ μὲν ὀμβροῖς ἡδὺ δ' ἐν εἴλῃ  
καλόκων ἀνθεῖ γάρως αὐτοφύες·  
τίς δὲ διέγνων νοσφέρ' ἐλικρινῶν  
βροτός; ἔξ ἀφανοῦς προφανέντ' ἀφανῆς  
κευθμῶνος ἐδέξατο κευθμῶν.

This is hardly short of perfect, for the emphatic repetition of ἡδὺ gives the ethical effect of the predominance given to the sun at the beginning of the second stanza of the original.

It is of course a question how far we are entitled to expect equivalents for such points at all, and Mr. Jebb, to judge by his translation of "Tears, idle tears," in which the burden disappears altogether, seems inclined to answer the question in the negative.

There are comparatively few specimens of Latin elegiacs, and this is as well, for the metre does not lend itself to the effects which are most acceptable to the spontaneous preference of the present day, and Mr. Jebb seems hardly to have the instinct for the rhetorical pathos and antithetical clearness to which the Ovidian couplet does lend itself whenever it is made the organ of really interesting poetry. Mr. Jebb's elegiacs are generally faultless and admirable rather than delightful, and in the translation of Longfellow's "Many a Year is in its Grave" we are reminded more than once that the Latin couplet is inevitably longer than the English. But we should have been very sorry to lose the exquisite delicacy of the original called for a little expansion in a language so clear and logical as Latin. There is only one line out of thirty that could be better. The last half of the second stanza of the original is—

"The heart you thought so calm and tame  
Would struggle like a captured bird."

That is pure simple literary English: the translation runs thus—

"*Tam, reor, apta iugo, tam scilicet inscia flammæ  
Corda micant qualis capta columba micat.*"

The line italicised is certainly in a way literary: no doubt it is pure Latin; but it is faultily and obscurely elaborate, and there is a positive ambiguity in *apta iugo*, which would naturally mean "fit for the marriage yoke" when applied to the hearts of two lovers.

Of the Latin Hexameters the most remarkable are "Tithonus" and "The Dying Swan." The latter is a very beautiful poem, even a delightful poem, but its delightfulness is not equivalent to the delightfulness of the original. "Tithonus" is throughout up to the high level of the opening lines, which run as follows:—

*Marcescunt nemorum, nemorum labuntur honores,  
Roriferæ deflent nubes, oriuntur et arvis  
Incumbunt subterque hominum defuncta recumbunt  
Secla, nec aestates non decidunt oloris.  
Solut ego immortale trahens ægerrimus ævom  
Carpore: inaresco, te cōmplectente, quietum  
Limen ad hoc mundi, dum cana remetiur umbra  
Secretas orientis imagine vanior aulas,  
Multiplices nebulas, sublustria templa diei."*

The original of the line and a half italicised is—

"The woods decay, the woods decay and fall,  
The vapours weep their burthen to the ground."

Perhaps the first line is deeper and simpler, and certainly the second is fuller and clearer, in the original than in Mr. Jebb's translation.

There is only one translation into Sapphics, and it can hardly be called successful: the apostrophes which begin the two first of Keats' stanzas—

"In a drear-nighted December,  
Too happy, happy tree,"

and—

"In a drear-nighted December,  
Too happy, happy brook,"

are irreducible to the forms of Horace or even of Catullus; at least they have not been reduced here, and though there is a good deal in the rest of the poem that recalls Horace, it principally recalls his ambitious ambiguity. However the rendering of the last stanza is really good.

The Asclepiads on Diaphenia are about good enough for the original, though it is doubtful whether an enthusiast for Elizabethan literature would think so. The stanza of *In Memoriam* that begins—

"Witch-elms that counterchange the floor"

is turned into a perfectly delicious epode in Iambic trimeters and dimeters.

Another stanza is turned into an admirable Alcaic Ode, in which the skill shown in specialising the allusions deserves the highest praise. All the Alcaic odes are good, with one exception: perhaps the best may be said to be the translation of Campbell's *Last Man*, where the difficulty of changing from ten-line to four-line stanzas is conquered so completely that one hardly perceives it must have existed. In the translation of Milton's *Hymn on the Nativity* the translator has been less successful. Every stanza of the original makes just two in the translation, and in such a long poem the subdivisions ought to be more varied, and one feels upon the whole, in spite of an abundance of felicities, that Horace is a better guide than Statius as to the proper length of an Alcaic Ode; moreover it is doubtful whether *stabulum regale* is an adequate translation of "the courtly stable."

Still the translation of Milton is better than the translation of Wordsworth into Greek Hexameters: one may certainly say that it is a great feat to have transferred the thoughts at all into real Greek, which is sometimes very rich and musical, as here,—

μίμνουσιν δὲ βροτοῖς ἐκ πημονένων παλινῳργοι  
φροντίδες ἡδὺνῶν, πλοῖσι μένει ἢ τε δέδορκε  
καὶ τὸ πέρην θανάτου, μέρουσι παρηγορέοντες  
σφωφρονέειν ἀδόλοισι παρηγορίῃς ἐνιαυτοί.

But taking the poem as a whole it is dull; at least one feels too often that the fiery clearness of the original is quenched; more than once one suspects the profusion of particles of serving as *chevilles*, and there are other traces such as we find in the Greek philosophical poets of working in a medium not perfectly plastic.

It is difficult if not impossible to describe the masterly rendering of *Abt Vogler* in the metres of the Fourth Pythian. Of course it was impossible to translate Browning into the style of Pindar or any Greek poet, but the translation is notwithstanding a magnificent poem in real Greek.

Here is a stanza with its translation,—

"But here is the finger of God, a flash of the Will that can,  
Existent behind all laws, that made them and, lo, they are!  
And I know not if, save in this, such gift be allowed to man,  
That out of three sounds he frame, not a fourth sound, but a star.  
Consider it well: each tone of our scale in itself is nought;  
It is everywhere in the world—loud, soft, and all is said:  
Give it to me to use! I mix it with two in my thought  
And, there! Ye have heard and seen: consider and bow the head!"

νῦν δὲ δαίμων ἐξεκάλυψε βλαν  
ἀστραπὴν ὥς, παντοπόρου κραδίης, θεσμῶν κνεφαῖον τέκτον' ἀριπρεπέων·  
πῶν γὰρ ἐξήν ἄλλο βροτοῖς τι τοῖνδ', οἷον κτύπους τρεῖς συμπλάσσει  
μὴ τέτρατον κτύπον ἀλλὰ σέλας πᾶμφλεκτον αἰρεῖν;  
αὐτὸ τοι ἁρμονίας φῶναμ' ἕκαστον εὐτελές,  
δαμόθρου, μέγ' εἴτε λεπτὸν, ῥήμ' ἀπλόον· τὸ δ' ἐγὼ κεράσας  
σὺν δυοῖν ἄλλοις τί τεύξ'; ἡκούσα', εἴβερε·  
θέσκελον θαυμάζεις ἄλκᾶν.

Almost the only point that calls for criticism in Canon Evans' translation of *Cenone* is that he has thought right to vary formulae which Tennyson repeats without variation.

Thus—

"O mother Ida, many-fountained Ida,"

is sometimes—

"O mater, liquidis celeberrima fontibus Ida,"

and sometimes—

"O mater, scatebrisque frequens et fontibus Ida;"

and—

"O mother, hear me yet before I die,"

is twice—

"Mater, quam morior prius hanc quoque percipe vocem,"

once—

"Mater, et hanc porro moriturae percipe vocem,"

once—

"Accipe quam morior, mater, prius hanc quoque vocem,"

and once—

"Mater, et haec audi quae verba novissima dico."

There are passages in the original like this—

"O happy tears, and how unlike to these !

O happy Heaven, how canst thou see my face ?

O happy earth, how canst thou bear my weight ?"

that suggest Catullus rather than Virgil, but taking the poem as a whole it is impossible not to approve the translator's judgment in being consistently Virgilian. Here is a passage full of legitimate felicities:—

"Yet, mother Ida, harken ere I die.

Fairest—why fairest wife ? am I not fair ?

My love hath told me so a thousand times.

Methinks I must be fair, for yesterday

When I past by, a wild and wanton pard,

Eyed like the evening star, with playful tail

Crouched fawning in the weed. Most loving is she ?

Ah me, my mountain shepherd, that my arms

Were wound about thee, and my hot lips prest

Close, close to thine in that quick-falling dew

Of fruitful kisses, thick as Autumn rains

Flash in the pools of whirling Simois."

"Hanc quoque quam morior, mater, prius accipe vocem.

"Quae pulcherrima enim—quoniam 'pulcherrima?' Pulchram

Mene neque esse ? Frequens juravit me quoque pulchram

Noster amor. Dubitemne ? At heri se propter eunti

Astra gerens oculis mihi, dum lascivit, in ulva

Pardus adulanti similis caudamque remulcens

Subsedit. Quid ? amatne virum magis omnibus una ?

Ah ! si monticolae circum ambitiosa dedissem

Brachia pastori premeremque ardentia labra,

O formose, tuis : uberrima basia raptim

Impluerent, velut autumno dum plurimus imber

Desiliens torto Simoentis in amne coruscet."

G. A. SIMCOX.

#### THE DISCOVERY OF FRESH MSS. OF AVERROES.

In Huet's *De interpretatione et claris interpretibus* i. 185 (ed. Hag. 1683 = p. 141 ed. Paris. 1680) we read the following words of Casaubon : "Vix ullos Averrois Arabicos codices in Europa reperiri posse putabat Scaliger . . . Ego tamen his versavi manibus Arabicum Averrois librum, ex oriente huc olim a Postello devectum ; quod miror Scaligerum fugisse, Postello olim amicitia et literaria consuetudine coniunctum. Eo libro continentur in Logicam, Rhetoricam et Poeticam commentaria." Renan says in his *Averroës et l'Averroïsme*, p. 80, &c. (2nd ed.), that he for a long time suspected the accuracy of this statement, but that, after he had examined the Florence MS., which contains an Arabic commentary on the Organon, he changed his mind and now believes that this was the MS. intended by Casaubon. I am enabled, by a fortunate circumstance, to prove the injustice both of the original suspicion and the subsequent conjecture of M. Renan. After finishing the catalogue of the Leyden collection of Oriental MSS., I resolved to append a description of the smaller collections which might exist elsewhere in Holland. Upon my request for information on this subject, I received *inter alia* intelligence from Mr. M. F. A. S. Campbell, principal librarian of the Royal Library at the Hague, of the existence there of 28 Oriental MSS., which had as yet been scarcely examined at all. Most of these MSS. were derived from the library of Clermont, and bear the inscription *Paraphé au désir de l'arrest du 5 Juillt, 1763, Mesnil*. It turned out that one of these MSS. was the Arabic commentary of Averroës on the Organon referred to by Casaubon. It answers entirely to the description, and has the signature of Postello at the end.\* It is a beautiful MS. in Moorish writing, collated with another MS. and with a few good marginal notes. The margin has suffered somewhat from worms, but no part of the book itself is injured. A comparison with different passages of the Florentine MS. (Medic. Laurent. clxxx. ap. Asseman p. 325) given by Prof. F. Lasinio, of Pisa, in his *Studi sopra Averroë* (I have not been

able to consult his edition of the *Poetics*), shows that the Postell MS. is, if not of greater, certainly of equal value. A few glosses, received into the Florentine text, are wanting here as well as in the Hebrew translation ; for a few errors of the text, corrected by Prof. Lasinio, our MS. presents the true reading ; while several corrections will have to be introduced from this codex into the published fragments of the text, against only one passage, where the reading of the Florentine MS. deserves the preference.

But even more important is the discovery, made at the same time, of another work of Averroës, the Arabic text of which was supposed (see Renan, p. 83) to be no longer extant. I mean "the great commentary" (as opposed to "the middle" commentary and the paraphrase) on Aristotle's *Metaphysics*. This MS. is described at length in the 5th part of the catalogue of the Leyden collection (p. 324, &c.), which is now ready for circulation, so that I need only state that it is clear from this codex, that Ibn Roshd himself wrote no commentary on books x, xii, and xiii (in other editions xi, xiii, and xiv), but that this was afterwards composed in his spirit, and attached as an appendix to the work (comp. Renan, p. 63). Most probably the Arabic translation of chap. i. of Aristotle's *De Caelo et Mundo*, found in the same collection and transcribed by the same hand as the commentary on the *Metaphysics*, is also the work of Averroës.

After the catalogue was already printed off, I received some information from Mr. Campbell relative to the origin of this collection, which, I think, deserves to be published. On the dissolution of the order of the Jesuits in France, the entire library of Clermont (initially by Mesnil) passed into the possession of Johan Meerman. Before bringing the MSS. to Holland, the new possessor parted with a few of them to the Bibliothèque Royale of Paris. This he did at the special request of the King, by whom he was raised to the rank of chevalier.

The remaining Clermont MSS. became part of the rich library of Meerman ; he arranged them himself, and sold a part which did not fall in with his own taste. The rest came to the market with his other collections in 1824, and were scattered to the four winds. In particular Sir Thomas Philips, of Middlehill, made large purchases, which together with thousands of MSS. and charters remain under the care of trustees.

Thus far Mr. Campbell. Of the Hague collection, 15 MSS. came from the Clermont library, 10 were purchased in 1816 at the Royer auction, the rest are presents from different persons. At my request, they have all not long ago been brought over from the Hague, and added to the Leyden collection.

M. J. DE GOEJE.

#### Notes and Intelligence.

At a meeting of the Society of Biblical Archaeology on Nov. 4th, Mr. George Smith read two valuable papers on Babylonian and Assyrian Chronology. In the first he gave an account of some fragments he has recently discovered which he believed formed the basis of the history of Berosus ; but Sir H. Rawlinson suggested that the tablet was rather a list of Prefects, on the ground that in no case did a son succeed his father, while the several groups were too small to constitute separate dynasties, and we know from another source that one of the persons named was a Prefect of the Palace. In this case it would seem that whereas the Assyrians reckoned by yearly eponymes, the Babylonians reckoned by the succession of Palace Prefects. However the persons mentioned are expressly called "kings," and one of them is said to have been an usurper. The word, too, used to denote their term of office is the one which commonly signifies "reign." The second paper described the newly-found fragment which contains the name and annals of Shalmaneser (see *Academy*, Oct. 15, 1873, p. 400), and compared the Assyrian and Hebrew chronologies.

We are glad to learn that Mr. Smith is about to start again for the East. This time he is being sent out by the Trustees of the British Museum.

#### Contents of the Journals.

*Revue Celtique*, vol. ii. pt. 1.—Adolphe Pictet : Some Celtic names of rivers. [Shows that the names *Déva*, *Düva*, *Divona* and our *Dee* point to Celtic river-worship.]—M. H. Kern : Nehalennia. [Makes her out to be a Germanic (not Celtic) divinity identical with Freya.]—A. Réville : An altar to Nehalennia found near Domburg in Zealand.—J. G. Bulliot : The ex-voto of the Dea Bibracte.—D. S. Evans : Supplement to the *Cambrian Bibliography*.—G. Lejeune : The popular poetry of Brittany. [An excellent sketch of the history of the Breton school of patriots represented by Legonidec and Villemarqué.]—R. F. Le Men : Breton proper names beginning with *ab* or *ap*. [A careful localizing of these names in Léon : but when it is further maintained that this district must have been colonized from Wales it is forgotten that Welsh *ab* or *ap* (for *ab* from *map*, "son") appears in Wales only in comparatively modern times.]—L. F. Sauve : The proverbs and adages of Lower Brittany.—W. H. Hennessy : The battle of Cnucha. [Irish text from *Lebor na huidre* with translation—goes against all]

\* What Casaubon says, that Postell († 1581) brought this MS. with him from the East, is confirmed by a note of Postell in a carefully written MS. containing two parts of the Canon of Avicenna, and also in this collection, in which he relates that he bought it at Constantinople in 1536.

attempts to localize Ossianic tales in N. Britain.]—Eug. Hucher and A. de Barthélemy: Supplementary remarks on the legends of Gaulish coins.—Hucher and H. d'Arbois de Jubainville: Durnacos: a passage of arms in which the latter gets the advantage.]—H. d'A. de Jubainville: A Gaulish *f* standing for *dh*. [Hardly convincing.]—W. Stokes: The Klosterneuburg incantation. [Gives the correct text and a translation.]—John Rhys: Etymological scraps. [Shows that mod. Welsh *dd* sometimes stands for original *y* semivowel.]—Among the reviews H. d'A. de Jubainville's on Littré and Brachet's French dictionaries contain some excellent remarks, but mod. Welsh *banadl* is not to be derived from \**banadilla* but from \**banatila*, and if French *juif*, Breton *jusev*, Welsh *Judeuw*, prove the existence of a vulgar Latin *Judevus*, he must suppose also *olevum* (= oleum) and *putevus* (= puteus), for Welsh has *olew* and *pydeu*.

**Hermes**, vol. viii., pt. 1.—M. Haupt: Coniectanea.—V. Rose: On the *Medicina Pini*. [Draws attention to a manuscript treatise of practical medicine abridged from Pliny and dating apparently from the first half of the fourth century. Other medical books based on similar materials are also discussed.]—Th. Mommsen: On a Latin glossary in Cod. Vat. 2730. [Prints a fragment of a glossary which Caspar Barth seems to have known in its complete form.]—H. Jordan: On Latin prose authors. [Contains among other things some valuable remarks on the *Rhetorica ad Herennium*.]—A. Ebeffhard: On the epitome of Valerius Maximus by Januarius Nepotianus. [Suggestions on the text.]—A. Luchs: Contributions to the textual criticism of Plautus.—A. Eberhard: On Horace. [On his use of the tribach in iambic lines.]—R. Hirzel: On Plato, *Politicus* 267 C seqq.

**Journal of the German Oriental Society**, vol. xxvii. pt. 3.—H. von Maltzan: Dialectic Studies on the Mehri compared with the cognate idioms. [A valuable addition to our knowledge of the phonology and grammar of the language. The Maghrib, Egyptian, Hijaz, Yemen, and Hadramaut are the vulgar dialects compared.]—Blau: Linguistic Studies on Old Arabic, with a map. [The diminutive-form *-ai* as a characteristic of Old Arabic, traced from the Ælanitic and Persian Gulfs to Edessa and Mosul.]—Mögling: Yeimini Bhārata, chapter ii. [Translated from the Canarese, with notes.]—Schrader: The Origin of the Chaldeans and the Primitive Home of the Semites. [See below.]—Grill: On the relation of the Indogermanic and Semitic Radicals. [The historical priority of biliteral roots assumed, because logically prior to triliteral. Aryan vocalism and formalism contrasted with Semitic consonantalism and materialism.]—Schweinfurth's Linguistic Results of Travels in Central Africa; reviewed by Pott. [Favourable. New data for Comparative Philology pointed out.]

### Selected Article.

The Origin of the Chaldeans and the Primitive Home of the Semites; by E. Schrader, in *Jrl. of German Oriental Society*, vol. xxvii., pt. 3. [The Northern Semites (Hebrews, Assyrians, Arameans) and the Southern Semites (Arabians) are separated from one another by their theology, mythology, and linguistic characteristics. Comparative grammar shows that Northern and Central Arabia was the original cradle of the Semites, whence they dispersed in all directions. The Northern Semites were long settled in Babylonia, where they borrowed their mythology and a portion of their lexicon from their Turanian (Accadian) neighbours. The latter kept up a connection with South Arabia, which explains why Nimrod is called the son of Cush.]

### General Literature.

Pitrè's *Sicilian Folk-Tales*. [Otto fiabe e novelle siciliane, raccolte dalla bocca del popolo ed annotate da Giuseppe Pitrè.] Bologna.

THE well-known editor of the *Canti popolari siciliani*, Dr. Giuseppe Pitrè of Palermo, has for some time been engaged in collecting and annotating the folk-tales of Sicily, and he expects, before long, to publish the result of his labours—in the shape of the fourth and fifth volumes of his *Biblioteca delle tradizioni popolari siciliani*. In the meantime he has reprinted from the *Propugnatore* eight of these tales, and has sent them forth in pamphlet form, as a specimen of his forthcoming work. The edition appears to have been limited to 30 copies, so that the *brochure* is not likely to fall into many hands. But all students of popular literature who make acquaintance with it will augur well from its appearance for the merits and the success of the work which it heralds.

The folk-tales of Sicily are already well represented, and have been rendered widely familiar by Signora Laura Gonzenbach's *Sicilianische Märchen*. But even those readers who most thoroughly esteem and prize her at present invaluable work will feel deeply indebted to Dr. Pitrè for enabling them to listen to the exact words of the Sicilian story-tellers, and to call up before their mental vision the heroes and heroines of the Sicilian folk-tales in their national costume, unaltered by the disguise of a foreign garb. So many special ideas are associated with each distinct language that a translated poem—and genuine folk-tales are for the most part poems in prose—cannot fail to lose, so far as its readers are concerned, many of its primary characteristics, and to find them replaced by others to which it was originally a stranger. In the case of languages which are very closely connected the change may not be more violent than that which a melody undergoes when it is transferred from one key into another, but where families of speech have very long been severed, transference from one to another cannot be effected without a wrench, and the effect upon what is transferred may be similar to that which Russian marriage songs so often lament in the case of a young bride who leaves her happy home to pine away "in the far off, stranger land." The Popular Tales of each

country are full of such expressions as are actual songs to a native ear, of such caressing diminutives and other terms of endearment as not only prove melodious in themselves to hearers who have always been familiar with them, but awaken musical echoes in their hearts for which only such a life-long familiarity can account. Such words or formulas of words as these, however, when literally translated into a foreign tongue, are apt to lose all their subtle influence; and if they are represented by such equivalents as occur to the audacity of a "spirited" translator, their hearers too often find the illusion dispelled which they would fain preserve, are too often deprived of the enjoyment felt by one who in fancy seems to breathe a strange but genial atmosphere, to wander beneath an alien but kindly sky.

It is this charm of language which renders these Sicilian tales in their present form so delightful. The mere sight and sound of them are enough to evoke such Southern fancies as can only be called up by a distinct effort of the imagination on the part of at least most English readers of German versions—however faithful they may be—of Italian tales. Apart from their diction there is not much that is novel in Dr. Pitrè's specimen stories. The first, "Lu Re di li pira d'oru," is the well-known tale of the younger brother who discovers and slays the stealer of his royal father's golden fruits; who, on his return with three sister maidens from that hostile being's subterranean abode, is robbed of the reward of his courage and skill by his elder brothers, but who eventually frustrates their knavish tricks and recovers his bride and his father's good opinion. The story has been fully discussed, and its numerous variants mentioned, by Reinhold Köhler in an article, referred to by Dr. Pitrè, in the *Fahrbuch für r. und e. Literatur*, vii., 1, 24-27. In the present version the fruit-stealer is a giant on horseback—"un gran giaganti a cavallu." The friendly advisers of the Prince-Errant are—the Three Hermits so frequently met with in Italian folk-tales, who tell him where to find the Giant, and how to chop off his head—Three Mountains, the first of bronze, the second of silver, the third of gold—and an Eagle, whose crow-stolen eaglet he restores to her, and who explains, after the Giant's death, that the Three Mountains were once Princesses, and have now resumed their pristine form—"ora ca lu giaganti muriu, chisti su' cristiani arrieri." The use of the word

*Cristiani* in the sense of "women" is noteworthy, and may be compared with that of the analogous Russian term *Krestyane* for country people.

The second story—"La Bella di li setti citri"—is a variant of No. 13 in the *Sicilianische Märchen*, "die Schöne mit den sieben Schleiern." One of the points in which the stories differ is worthy of notice. The "Seven-Veiled Beauty" will die unless water is given to her the moment the coffer is opened in which she has been concealed; the Lady of the Lemons is of a different nature. The King of Spain's son who seeks her hand is told that when he has gathered the Seven Lemons he is to open one, and say to the lady who will emerge from it, "Acqua, signura!" If she refuses the proffered beverage, which appears to be a "Water of Life," he is to try a second fruit, then a third, and so on. If he cannot succeed in inducing one of the lemon-ladies to drink, he will be turned into a marble statue. He unsuccessfully opens six lemons, the lady in each instance rejecting his proffered refreshment with a "Un nni vuogliu." But from the last lemon emerges a beautiful lady "tutta vistuta di culuri di rosi" who takes a drink—"Idda subito vivi"—whereupon the spell is broken and the marble statues, the Prince's predecessors, all come to life. A curious Norse version of this story is given by Asbjørnsen in No. 66 of the "New Series" of his *Norske Folke-Eventyr* (Christiania, 1871). In it there are three Princesses enclosed in as many lemons (*Tre Citroner*). The thirsting hero bites a piece out of each lemon. In each case appears a fair lady who at once declares she must immediately have some water or she will die. Water being scarce, two of the ladies keep their word and expire; the third is saved. The Southern origin of the Norse tale is plainly enough evinced by the lemons from which it derives its name. Some Norwegian sailor, most probably, heard the story in Mediterranean waters, and brought it back with him to his Northern home.

The third tale is one which is to be found in Straparola's *Tredici piacevoli notti*, and is the same as the story which is so popular in Russia under the name of "Ermilian the Fool," or "By the Pike's Command." The fourth, "L'omu cavaddu," or "The Horse-Man," is the well-known tale of the boy who turns himself into a horse, and is sold, under that shape, by his father. The father is warned by his son that he must retain the bridle, but at last he allows it to be carried off, along with the horse, by the magician who has been his son's master in the Black Art. The boy thereupon becomes his master's slave, but at last effects his escape. Of this story, and of its introduction into Europe from the East, a full account is given by Benfey, *Pantschatantra* i., 410-13. In the present version the usual transformations at the end do not occur, the magician behaving kindly to his pupil, on whom he bestows the hand of his only daughter. The fifth story, "Li Batioli," or "The Nuns," belongs to that class of robber tales of which "Morgiana and the Forty Thieves" is the best known representative. The sixth, "Li tri Brinnisi," is one of those stories, so dear to the Italian mind, about a faithless wife and her confessor, in which she, the servant lad, and the "cunfissuri," sing each a *brinnisi*. The seventh, "Lu Mastru Scarparu filosifu," is almost the same as Straparola's story of "Papiro Schizzapadate." One of the expressions used in it is curious. The "philosophical" master points to his wife, and asks the lad who serves him what she is called. "La maistra," replies the boy. "No," exclaims the pedant, "her proper name is *grolia 'ntua*." This would be somewhat unintelligible did not Dr. Pitre explain in a note that "in Latin words the people are wont to unite the last consonant of a leading word with the first of that which follows it," whence *grolia*

*'ntua* for *gloriam tuam*, or *agnu sdeu* for *agnus Dei*, &c. The eighth and last story, that of "Lu surci grassu e lu surci magru," is closely akin to our own "Town and Country Mouse," and to the original from which that fable sprang.

By way of giving some idea of the dialect of these specimen tales—which, on account of their intrinsic merits as well as of the manner in which Dr. Pitre has treated them, lead us to expect much from his completed work—we will quote the concluding paragraph of the story of the two mice:—

A lu tràsiri 'nta lu maasenu, prima si 'nfilò lu surci di maasenu, e comu si 'nfilò chiama:—"Cumpari surci di jardinu!" E comu chiama, gnau! jettasi un gattu, e si l'afferra 'nta li granfi. Lu surci di jardinu comu jetti fari *sui! sui!* si jetta nn' arrieri e sfilletta; e di ddocu nni vinni ca

Cci dissi 'u surci magru ô surci grassu:  
"Si scappi, 'nta li vrocchuli t'aspettu."

W. R. S. RALSTON.

### LITERARY NOTES.

The *Librairie des Bibliophiles* is publishing in its collection *Les petits chefs d'œuvre* the *Contes* of Hamilton, than which it would be difficult to find anything more deserving of the name. We have received *Le Bélier* and *Fleur d'Épine*—the latter one of the delights of Fox—in type and paper quite worthy of the dainty grace of the style,—the style that even Sainte Beuve thought it impossible to describe better than in words borrowed from the author, when speaking of his sister and muse, who married the Chevalier de Gramont . . . "un visage tout aimable . . . Son esprit étoit à peu près comme sa figure. Ce n'étoit point par ces vivacités importunes dont les saillies ne font qu'étourdir qu'elle cherchoit à briller dans la conversation; elle évitoit encore plus cette lenteur affectée dans le discours dont la pesanteur assoupit; mais sans se presser de parler elle disoit ce qu'il falloit et pas d'avantage." In these fairy tales the author of the *Mémoires de Gramont* gently ridicules while indulging the fashionable rage of the day for fictions à la *Mille et une Nuits*; some of the scenes are gems of light poetical description, and the introduction to *Le Bélier* is in verse of a kind that seems so admirably suited to the genius of the French language that it is one of the puzzles of literature to explain why, besides having no master and few rivals in its use, Hamilton has also had hardly any followers or imitators; not less charming is the comic effect produced by touches of ironically graphic description and by the flights of a fertile fancy ingeniously employed in inverting all the rules of sober narrative composition. It is the highest praise that can be given to *Alice in Wonderland* that we are now and then reminded in it of the artistic inconsequence of Hamilton's style, though in finish and execution there is of course all the difference between the furniture of an English nursery and a drawing-room *Louis Quatorze*.

A recent number of the *Nyt dansk Maanedsskrift* contains an interesting and exhaustive study, by Dr. Brandes, of the Danish poet Hauch, who died at a great age last year. Besides a brilliant examination of Hauch's dramas and lyrics, the paper contains an interesting account of the feverish controversies which occupied the first years of his literary life, his defence of Oehlenschläger against Baggesen, and the violent attacks which were made against himself. It is strange to read on the next page that it was a remark by Oehlenschläger himself, depreciating the qualities of Hauch's poetry, that silenced the Muse of the latter for seven years. Hauch, by the way, though classed among Danish poets, was born in Norway in 1790.

Mr. Disraeli's Inaugural Address to the University of Glasgow (Longmans) would have its real merits—as a model of literary style and rhetorical art—more fairly appreciated were it not for its *apropos* as a political manifesto. The exordium on self-knowledge, its uses, and the scanty help given to the young by their natural superiors in its acquisition, was brilliant, sincere, and without *arrière pensée* in its cynicism. But all the orator's art was required to disguise the underlying moral purpose with which he insisted upon the importance, to

intelligent young Scotchmen, of understanding the spirit of their age, as well as the bent and powers of their own minds, and assured his hearers that, if the spirit of the age was an evil spirit, success in life might consist with resistance to it, if such resistance were based upon adequate comprehension. To assist the Glasgow youth to such comprehension, Mr. Disraeli proceeded to explain that the spirit of this age is a spirit of equality, and that there are different sorts of equality, to wit, civil equality, which is the pride and privilege of Britons, social equality, which has been the dream and the bane of the "gifted people" of France, and material equality, which is sought by the "disturbing spirit which is now rising like a moaning wind in Europe," and threatens the existence of private property. It would be hard to find a better example of sound rhetoric and false reasoning than Mr. Disraeli's treatment of social equality as fatal to an aristocracy of talent by abolishing classes—as if civil equality did not abolish the relation between class-rank and the exercise of political power, and so for all purposes of aristocracy practically abolish classes; and his treatment of material equality, or a belief in the "rights of labour" as tending to abolish patriotism, and "abrogate countries," a threat which could be depended upon to escape criticism in Scotland—which might not care to remember that it ceased to be a country, much to its advantage, a good many years ago. A better argument against the coarser socialist ideals of equal physical enjoyment was offered in the suggestion that a population enervated by the attainment of a dead level of material ease would fall a prey to the tyranny of a naturally selected aristocracy. It would be interesting to know how many of the academical audience noticed the ex-Premier's omission to explain why natural selection could only produce an aristocracy of the wrong sort in the wrong place; to any such the address would have a wholesome stimulating influence.

### JOHN GOUGH NICHOLS.

THE antiquarian world has lost in John Gough Nichols a sound and zealous friend. He was, Dec. 3, 1835, elected F.S.A. of London, and subsequently corresponding F.S.A. of Scotland and Newcastle; was V.P. of the Middlesex Archaeological Society; on the council of the Surrey Archaeological Society; and an active supporter of other bodies. He was by descent an antiquary. His grandfather, the Historian of Leicestershire, was followed by John Bowyer Nichols, and these by the latter's son. All careful men and all learned, yet it was left to the latest to embrace the erudition and to augment the painstaking of the two preceding. For upwards of forty years his care and attention have been devoted to the study of antiquity, and especially of genealogy. From 1830 the volumes of the *Archæologia* have contained the results of his labours, sometimes accompanied by exhibitions, sometimes by remarks worked out with great diligence and persevering industry; his communications have extended down to the latest period, one on a favourite subject with him—the Guilds—being still unpublished. He was for very many years sub-editor and afterwards editor of the *Gentleman's Magazine*, and under his direction and the supervision of its different editors (Mr. Mitford and Mr. Bruce) it maintained itself as a correct and good depository of facts; indeed it was Mr. Nichols' great care in exposing all "false claims to titles and pseudo-genealogies" which enabled him to render great service to historical truth. His knowledge was general and well applied, and on the committees of the mother society—whether the genuineness of the Paston Letters was to be established, the public sepulchral Monuments to be catalogued for preservation, or the Parish Registers and Inscriptions in our graveyards and churches to be kept and catalogued—his acute mind and his wide acquaintance with the history of his country stood the society in good stead. In 1833 the *Collectedanea Topographica et Genealogica* was started under his care, though without his open announcement as editor: that publication ceased in 1843, and then in 1846 the *Topographer and Genealogist* followed, with him as avowed editor, and in 1863 that work was followed by the *Herald and Genealogist*. In all these publications the erudition and the fearless exposure of errors and of false pedigrees stand out most prominently. Nor were these periodical works his only claim upon literature.

In 1844, in conjunction with Mr. Shaw, he reprinted Anthony Munday's Fishmongers' pageant "Chrysanaleia" of 1616, with illustrative documents and an historical introduction, he being a member of the Stationers' Company. In 1845 he published examples with drawings of decorative tiles; in 1852 the literary remains of his friend John Stockdale Hardy; and in 1857 he edited the *Literary Remains of King Edward VI.* for the Roxburghe Club. Prefixed to the work is a biography of the King, which displays to its fullest extent the minute care with which everything proceeding from Mr. Nichols' pen was produced, the fulness of the information, the soundness of the deductions, and the wide scope of the inquiries. The different public depositories were all searched with the greatest diligence, every available source of information was made use of, and the whole gives us a nearly perfect picture of the King and of his times. The same knowledge and the same diligence and research which he used for his own publications he willingly gave to other editors, and no one of the Camden Society's works, where he aided the different editors, is without the marks of his skill, his research, and his ability. With that society he was from its foundation in 1837 most closely connected. For it in 1859 he edited *Narratives of the Days of the Reformation*, chiefly from the MSS. of Foxe the Martyrologist, with two contemporary biographies of Abp. Crammer, and other volumes were edited by him; the Catalogue in 1862 was his own work, and his advice often helped the council in more difficult matters. Some of his lucubrations indeed grew considerably under his editorship, and that which was begun as a thin volume not unfrequently ended in a thick work, which nearly exhausted the particular subject under notice. For this he used, what he was well acquainted with, our stores of MSS. in the British Museum, the Bodleian Library, and those which were till recently scattered in many places, yet are now to be found in the Public Record Office. Nor were the different societies left without aid by him. The Sussex Archaeological Society—the labours of which he eulogised in his preface to the *Topographer and Genealogist*—and the Surrey profited by his pen, whilst to the Middlesex he contributed very valuable notes on some of the principal Companies and their members, as also on the Brasses at Harrow and other articles. The new edition of *Hutchins' Dorsetshire* has been largely added to by him; not only has his attention been directed to a correct reprint of the work, but scarcely a parish has passed without emendations and improvements. To many a young student he has given aid in directing his thoughts, and taught him how best to avail himself of the many materials—often little known and still less appreciated. That a person so willing and anxious to help, and so desirous of ascertaining and publishing the truth, should have many literary friends is not to be wondered at. Some well known have passed away; many survive, and it is sincerely to be hoped that the same spirit with which he worked will be possessed by others, and as conscientiously used. He died at Holmwood, near Dorking, on the 14th November, 1873, in the 68th year of his age.

WM. DURRANT COOPER.

### Art and Archaeology.

#### THE DUDLEY GALLERY.—THE SOCIETY OF FRENCH ARTISTS.

ONE begins already to get tired of the winter exhibition of the Dudley Gallery. The three or four best things continue to be good, but the forty or fifty second best used to be strange. One used to be able to go with a hope of finding out something of new tendencies in art which had variety at least to recommend them; besides which Mr. Solomon's and Mr. Donaldson's experiments were always interesting in themselves, and Mr. Crane's were always ingenious and occasionally delightful. All these contributors are absent, and the general impression of the exhibition as compared with the Academy is simply a sense of inferior accomplishment, which is compensated, so far as it is compensated, rather by simplicity than by novelty of intention, though it is always better that immature or mediocre artists should try to be pretty and pleasant than that they should try to be clever, and at the Academy the effort to be clever is almost inevitably all but universal.

The influence that one seems to find strongest this year is the late Mr. Mason's: perhaps the most considerable artist who has yielded to it, all the more readily because it hardly led him from his own natural direction, is Mr. P. R. Morris, whose sketch of the "Golden Hour" (168), with two children and two white calves moving through the twilight when there is a crimson mist upon the earth and a golden glow in the sky, might almost be taken for the master's own, only there is rather more solidity and less sense of everything melting away into a dank rich darkness. One finds an inspiration (not an imitation) of the "Harvest Moon" in a work of Arthur Hopkins (333), "The night cometh when no man can work": reapers with scythes are busy upon a hill-side which has an orange glow over it, though the sky above is getting pale and green, and the figures are well relieved against the sky, and those who wish to believe in the poetry of labour have a good excuse for thinking that here they have it. In (282) "Now fades the glimmering landscape from the sight," Joseph Knight, and (263) "The Morning Star," R. C. Leslie, we are reminded of Mr. Mason's poetry in grey, as the other works cited remind us of his poetry in purple and gold. The first is a moor piece, the second a sea piece. It is not an abrupt transition from the last to the work of a perfectly mature and independent artist, Mr. H. Moore's "A Nor'-wester—Coast of North Wales" (236), which is one of the most pleasing of his studies of grey sea and sky and shore, which are so curiously delicate in drawing and so deliberately opaque in colour.

Of the ordinary pre-artistic pleasantness of nature, the pleasure of feeling oneself alone and overpowered by a multitude of delightful unfamiliar sights, perhaps the best expressions are "Through—Shade to Sunshine" (47), a valley all gold and green with a stream through it, by Alfred Parsons, and (264) "Twilight on the Slaney, Clonegal, County Carlow," by Cecil G. Lawson; both give an uncritical spectator the pleasure of having been there at a lucky time. Mr. W. S. Raven's "Highlands after Rain" (243) is solemn and rich, and probably all the truer to nature for being blotchy; his "Llandilo and Vale of the Towey" (25) is provoking: the rosy sunshine is pleasant, but why is half the picture to be taken up with flat moor pasture? There are a good many agreeable river pieces. "A Backwater on the Thames," by R. Macbeth (173), is one of the best.

Of serious figure pieces with some romantic intention there are fewer than usual. "Sarah and Tobias," by C. Goldie (322), is graceful and in a way religious, only they are not in earnest, their seriousness is not due to love or alarm or anxiety, but simply to a conscientious sense of decorum; if one had seen such a young couple at church one would have said, "How devout!"

Of the most important contributors, Mr. Marks sends four small and not characteristic landscapes, and one small piece, "The Convent Drudge," in his usual vein of humour. Mr. Watts' "Eve" (75) has the power and knowledge with which we are familiar, with the traces of confused endeavour from which the painter sometimes escapes. The great mother marches between a lion and an eagle with her face drawn strangely upward and backward towards golden light, in which it is a darkness, and dim purple crocuses spring up under her feet out of the gloom, in which the lion seems a golden cloud. Mr. Leslie's "Fountain" (156) is a pleasant replica of a portion of his picture at the Academy. One fancies that the graceful girl in blue and white looks rather less like an English young lady in a classical masquerade than she did in the larger picture; but it is still matter for regret that the artist found his eighteenth century maidens in golden afternoons too narrow a field to cultivate longer. Mr. Whistler's "Variations in Pink and Grey" (193) is very perfect within the arbitrary conditions; a Philistine can no longer take offence at the appearance of smudginess, and probably perspective is not to be had without solidity, to which the artist conscientiously objects: it must be admitted that his work upon his own terms does more to harmonise with the decoration of a modern house than almost any other. Mr. Wallis sends one of his pieces of dull Venetian splendour (355), and Mr. Legros reduces the Casa d'Oro into a theme for rich subdued colour which enforces a sense that Venice lately has been a very shabby town (135): he sends also a "French Girls' School" (379), where for a wonder the presiding sister is withdrawn out of the uncompromising daylight which the artist generally chooses to pour upon his French peasants, and which is shed in this picture on the class.

M. Tadéma sends "Two Children," who look archaic, but strangely pleasant, and as usual very solid. Mr. Rivière sends "Three Children on a Carhorse" and a very pretty "Dog with an Orange" (76). Mr. Hywood Hardy sends a "Stricken Lioness" (66) that is pathetic in the obvious way, and drawn and painted well enough. Miss Steele's "Starlings" (116) are odd and amusing, partly because we are not used to seeing chimney-pots close; and Mr. P. Macquoid (349) has a delightful "Spaniel running after a Butterfly," which a bird is chasing too. F. Dalou has a pleasant terracotta statuette of a girl with a book twisting about on a sofa; the committee call it "A Lecture." There is no danger of a visitor missing the portrait of himself by Melchior Anderegg, the Swiss guide, nor G. Manet's portrait (15) of Le Bon Kock.

Though the last would be a loss, it is hardly as striking as the cheerful brutal literalness of "Visitors to Boulogne" (77), by the same artist, at the French Gallery in Bond-street, where the lady in blue and her little girl are represented with the knowledge of a really able painter as they might appear to any child of the little girl's acquaintance. This is pleasant on the whole than Fantin's "La Liseuse," where the dull refinement of execution corresponds to the flabby ladylike patience of the model and the weariful accomplishment of the *Revue des deux Mondes* she is reading. There are a good many flower pieces by the same artist: and one large piece of still life, "Un coin de table" (83), that is really quaint and pretty. The great Delacroix (an entombment) this year is not so large or so crowded or so metallic, or to say all, so operatic as the "Death of Sardanapalus;" but one feels still that this artists' power is as much literary as pictorial: at least he paints too much as if it were his only business to give literary men emotions: the kneeling St. John is richly coloured; the Mother is too realistically treated to be so young. H. Lévy obtrudes upon visitors four heroic and perhaps accomplished pictures of the four seasons, which are at worst tiresome, and a "Christ in the Tomb between two Angels," presumably of Death and Resurrection, which serious people will find offensive, and a small picture (34) of an Arab horseman pursued, a sort of cross between Gilbert and Gérôme. Ribot's "Girls Reading" (1) recalls Millais' "Autumn Leaves" in feeling and the old Spanish masters in execution; his "Nature Morte" (26) is a masterly portrait of the last flare of a dying candle. There is some humour in Momzie's "Two Gardeners" (70) and Duez' "Breakfast in the Studio" (9), where an artist in comfortable brown velvet is offering wine to a model in a fearful and wonderful bonnet—fashionable when?—and "Sculpture at the Salon" (43) by the same artist, has a curious effect, as if the marble busts were masks of the visitors. Bellenger's "Ben Abdallah" (59) is a fine and solid portrait of a Moorish mulatto. C. Landelle's "Young Marguerite," though too self-conscious, is a pleasant change after the Oriental model we have been used to associate with the name.

Even in England we are familiar with Corot and the moist airy truth of tone to which he sacrifices almost every other truth of sight (especially truth of texture), to say nothing of all truths of knowledge; "A Pastoral" (66) is a more imposing example of the poetry of impression to be had on these terms than is often sent to England. Neither "Rousseau's Farm on the Banks of the Oise" (45), nor Diaz' "Opening in the Forest of Fontainebleau" (65), nor Daubigny's "Windmills at Dordrecht" and "Washing on the Oise" (21, 33), can be charged with suppression of knowledge; perhaps the bright, solid detail of Rousseau's willows may be said to be delightful, and the solemnity of Diaz is certainly impressive; so is the sunset in Daubigny's smaller picture; but after all they are like the "Windmills at Dordrecht," masterly rather than sympathetic. Ordinary French work is rather artistic in intention than literal or literary: it does not show what an ordinary person or cultivated person sees or wishes to see, but what it takes the trained eye of the artist to discern, the trained hand of the artist to execute. This makes comparatively naïve work like Madame Casin's "Sketches near St. Leonard's" (107, 19) fresher and more interesting, but it exposes us to powerful work like Courbet's "Sands near Honfleur" and Fromentin's "Sahara," that are simply tiresome, and makes even such a poetical painter as Millet oppress us with a picture like "November" (118), nothing in the world but a brown terraced hill-side with birds taking wing.

Of lighter work we may notice "The Last Valley at Newport"

(18) by Laffarge, which is a striking portrait of a striking scene, and "Golden Hill," by W. J. Hennessy (119), very bright and true in detail, though it is hung so high as to confuse the perspective; as well as an early work of Whistler's (110), "The Yacht Race," with the sky carried further than he carries it now. "A Factory" (111), C. Mornet, raises the question whether something of Mr. Whistler's charm may not be had without effacing every outline. "An Arab Fair," by Y. Huguët (97), and "Paying the Tithes," by J. Garnier (76), have a good deal of the gaiety of Frith's and some of Maclise's work, with signs of a more thorough artistic training.

G. A. SIMCOX.

### A SUPPOSED RAPHAEL.

MR. W. KING LUCAS, of No. 11 John-street, Bedford-row, is in possession of a well-sized Italian picture which some persons are minded to attribute to the hand of Raphael. The picture is termed "The Three Graces," but ought perhaps rather to be called "The Three Goddesses"—Juno, Pallas, and Venus—as one of the figures, the one which from the type of facial beauty would most naturally be regarded as Venus, holds an apple in her hand. Two River-gods, represented under the form of statues, are also present, couched in the two corners of the picture, and forming a very leading specialty in its treatment. It may be questioned whether any explanation of these River-gods could be offered, on the assumption that the picture represents the Graces; while, if we suppose it to stand for the three Goddesses, competitors for the prize of beauty on Mount Ida, we may readily infer that the River-gods indicate the Scamander and Simois. Not that it could be regarded as in any way a *dramatic* presentation of such a subject, for there is no sort of symptom of rivalry or contention on the part of the three beauties; but, as a simply ideal or abstract treatment, it might be accepted with no great reluctance or misgiving. Using this supposition as at any rate more convenient for the purposes of identification and description, we find Pallas as the central figure, with golden elaborately-braided hair, and a cast of countenance of rather marked individuality; her back is turned to the spectator, or rather partially turned, the whole sway and poise of the figure being very elegant and informed with life. Juno stands to the spectator's left, and Venus to his right. The pose of the head in the Juno is very like, and might well have been copied from, that of the famous Galatea by Raphael, though the expression differs: this head is rather vapid both in contour and in execution: The Venus is of a very regular order of loveliness, the features delicately chiselled and refined, without much that can be called the *beau idéal*—rather a conformity to an eclectic standard of beauty derived from works of art. The figures are naked, save for some slight indications of gauzy drapery, which may perhaps be later and meaningless additions for propriety's sake. Whether with or without these impossible twirls of undefined vapour, the spirit of the picture is entirely pure; and the treatment of the landscape background—with pale grey sky, light clear tints of verdure, and a single tree forming the apex of the composition—concurs in producing a like impression. With purity, a high degree of beauty is combined; dependent not so much on the faces, or on any particular point in the individual figures, as on the grace of grouping, suavity of conception and design, and well-balanced union of living repose and lithe mobility in the figures.

As to the attribution of the picture to Raphael, we cannot say that we see any distinct internal evidence favouring such a surmise. Some portions—more especially of the foreground with the River-gods—might well have come from the hand of some pupil of Raphael's; but on the whole this supposition also (which has been suggested elsewhere) does not appear to us well sustained. In certain respects the style of the work reminds us more of Primaticcio, or some other of the Italian painters who worked in France for Francis I. But we must for the present be content to say that the author of this picture is uncertain; only, whoever he was, he had a fine sense of beauty and of the abstract in style, and a full capacity for giving expression to these in his work. The latter "is said to have been discovered accidentally in some obscure part of the metropolis, and was overlaid with the dirt and varnish of years," now cleared away.

W. M. ROSSETTI.

### THE WAGNER SOCIETY.

IT will be in the recollection of many of our readers that this society was founded last year, with the object of bringing before the public the works not merely of Wagner, but also of Berlioz, Liszt, and other composers of the modern school of musical thought. Three concerts were given last season, at which only a part of the intended plan of the society was carried into execution, inasmuch as the programmes consisted entirely of selections from the works of Richard Wagner. Encouraged, doubtless, by the success of the first venture, and the warm reception accorded to music most of which must have been new to the larger portion of the audiences, the society has for the present season announced a series of six concerts; and the first of these took place on the 14th of November last in St. James's Hall.

Seldom has a programme more attractive in its novelty been offered to the public than that of this concert; and the interest excited was evinced by the large number of musicians of note who were present on the occasion. An excellent orchestra of some eighty performers was marshalled under the bâton of Mr. E. Dannreuther, the conductor of the society. Within certain limitations it may be said that a conductor, like a poet, is born not made; and though practice and experience are doubtless necessary to secure perfection in this, as in other departments of musical art, far more of a conductor's success depends on natural temperament and a quasi-magnetic power of imparting his own feeling of the music to the performers whom he directs than on any amount of facility resulting merely from practice. That Mr. Dannreuther possesses no ordinary qualifications for his task was shown by the admirable way in which, under his guidance, the mostly unfamiliar and difficult music was rendered by his orchestra.

The overture to Spontini's opera *Olympia*, with which the performance commenced, is a characteristic and pleasing specimen of the style of a composer once strangely overrated, now hardly less unduly depreciated. Readers of Berlioz's entertaining "Les Soirées de l'Orchestre" will remember the enthusiastic tone in which *La Vestale* and *Fernand Cortez* are eulogized. The account of the former work, especially, inspires the wish to hear it well rendered. Of this, however, in the present state of opera in this country, there seems unfortunately but little prospect. *Olympia* was first produced in Paris in 1819 with a comparative want of success, which Berlioz attributes to political allusions in the *libretto*. Its reception in Berlin, however, where it was brought out in 1821, was far more favourable, and it is still to be occasionally heard in Germany. The overture, though it can hardly be credited with genius, in the highest acceptance of the term, is a very vigorous and pleasing piece, most brilliantly scored for the orchestra. The episode in C major which follows the second subject is, both in melody and instrumentation, strongly reminiscent of Cherubini; and the animated *coda* is interesting as a foreshadowing of the now well-worn Rossinian *crescendo*.

Great interest attached to the piece which followed—a MS. Pianoforte Concerto, by Joachim Raff, composed for Dr. Hans von Bülow, and played by him on this occasion for the first time. Though a most voluminous composer—the present work being numbered Op. 185—but little of Raff's music has as yet made its way into this country. The Concerto played by Dr. Bülow will doubtless excite the wish to hear more of the works of one of the leading German musicians of the present day. It is written in the orthodox form, so far as relates to the customary division into three movements; but these movements are all notable for a much larger proportion of episodic matter than is customary in the works of earlier masters. This predominance of episode is a distinguishing feature of the new German school; and most of Raff's larger compositions furnish striking instances of it. Whether this adds to or impairs the value of the whole work is a point on which musicians will differ; it certainly labours under the disadvantage of protracting the length of the music to what many will feel to be an undue extent. Space will not allow a detailed analysis of the Concerto; it must suffice to say that it is distinguished by nobility of thought, great originality of idea, an exquisitely tender flow of melody in the slow movement, and wonderful vigour and animation in the *finale*. The solo part, which is exceedingly brilliant, and of no small difficulty, was played by Dr. Bülow

with a perfection of finish and an alternation of fire and delicacy which were simply unsurpassable; and in spite of its great length, the Concerto rivetted the attention of the audience to its last note, and was received with the greatest enthusiasm.

To Raff's Concerto succeeded a selection from the *Meistersinger* of Wagner—the only specimen of that composer's music given at this concert. The portion chosen consisted of the "Meeting of the Mastersingers," from Act I, and the instrumental prelude to Act 3. The latter had been performed at the society's concerts last season; the former was given for the first time. Many even of Wagner's warmest admirers will agree that the choice of the new piece was an unfortunate one. Probably no music ever written loses so much when detached from the stage as the greater portion of Wagner's. The movement in question is most effective in its place in the opera. It consists mostly of a simple and melodious phrase, accompanying the entry of the first of the mastersingers, and repeated in different keys and with different tone-colouring as each successive member of the guild makes his appearance. In the theatre the significance of the musical treatment would be intelligible at once; but in the concert-room many of the audience must have been sorely puzzled to know what it all meant, and as the first subject recurred time after time, inclined to cry with Falstaff, "Thou hast a most damnable iteration, Hal!"

The second selection—the Introduction to the 3rd Act of the same opera—is one of the few pieces by its composer which, as abstract music, will bear transplantation from its original soil without serious injury. The audience were informed in the book of words that the act opens on a quiet and bright Sunday morning; and surely nothing in music could more aptly paint the tranquil repose of a quaint old town like Nuremberg in the early sunlight than the masterly tone-picture which Wagner has presented to us. As the delineator of a particular mental condition—what the Germans call a "Stimmung"—he has never been surpassed, and the present is one of his happiest inspirations. The instrumentation, especially in the use of the four horns, is most masterly; and the effect upon the audience was evident from the tumultuous applause which followed, and which could only be allayed by the repetition of the movement.

The first part of the concert was brought to a close by Berlioz's overture to *King Lear*. This work, which has been seldom, if ever, previously performed in London, was written about 1830, during its composer's stay in Italy as prize-medallist of the Paris Conservatoire; and it must have been a strange and very pleasing surprise to those who heard it on this occasion. Berlioz is so generally considered the *ne plus ultra* of wildness and incoherence, that it might naturally have been anticipated that with such a subject he would have presented us with a piece of music full of sound and fury signifying nothing. On the contrary, the overture to *King Lear* is remarkably clear in form, and full of weirdly attractive melody, the second subject of the *allegro* being one of those haunting phrases the impression of which dwells in the memory long after the actual notes are forgotten. The instrumentation is gorgeous—rich and sonorous, but never degenerating into mere noise. The execution of the work, which is of no slight difficulty, was absolutely perfect. It is to be hoped that a second opportunity will be afforded to musicians of hearing this most interesting overture.

Great as Dr. Bülow is as a pianist in every point of view, he is nowhere greater than in his interpretation of Liszt's music; and the excitement caused by his performance at the commencement of the second part of the concert of that author's "Fantasia on Hungarian National Airs," with orchestral accompaniment, was such as is not often seen in a concert-room. Three or four peculiarly piquant Hungarian melodies are worked by Liszt into a fantasia, the solo part of which perfectly bristles with the most enormous difficulties; and the way in which these were overcome by the player, without the slightest appearance of effort, was something absolutely marvellous. The work itself is a most charming composition, though one which, from the demands it makes upon the soloist, is not likely to be often heard in public. Dr. Bülow's prodigious memory was shown by his performing both the Fantasia and Raff's intricate and elaborate Concerto without a book.

A very well-considered and careful rendering of Beethoven's great Symphony in C minor, a work so well known that any

comment is superfluous, brought this most interesting concert to a successful close.

One word in conclusion should be added in praise of the excellent arrangement carried out at this concert, of closing the doors during the performance of each piece, and only allowing ingress and egress during the intervals. The advantages of the plan are so obvious that it is to be wished it were universally adopted.

EBENEZER PROUT.

### "RICHELIEU" AT THE LYCEUM.

It is late in the day to talk of the faults and merits of Lord Lytton's *Richelieu*, but not of the merits of its performance at the Lyceum Theatre, where Mr. Irving—the most prominent of recent figures upon the English stage—has essayed to make his own the character written for Macready and inherited by Mr. Phelps. Genuine interest has been taken and will continue to be taken in this performance of Mr. Irving's at the Lyceum: a theatre to which people do not go so much with the questions, "Is the play good? What of the *mise-en-scène*?"—for that is almost known beforehand and settled to begin with—as with the inquiry how Mr. Irving has again acquitted himself: whether he may now be permanently classed in the rank of great actors, or whether he is still on his probation, doing informally that which new comers at the Théâtre Français have always to do *formally*: that is, seeking through many parts a confirmation of the favourable verdict pronounced at first on one. People do not go to the Lyceum for the sake of the scenery and appointments, I have said; but let me add in a parenthesis, before discussing Mr. Irving in his new part, that it would not be particularly discreditable to them did they indeed do so—if Mr. Irving were out of the way. For at the Lyceum these things are better managed than at any other London playhouse. They are not thrust into prominence—a display of barbaric splendour and lavishness—but they take their proper place, always cared for and long thought about, and they make a harmonious and well-studied background to a performance which always endeavours to please the artistic mind and eye. What can possibly be better in their kind than the costumes in *Richelieu*?—those harmonies of pale grey and pale green and of rich browns. The colours do not dazzle—they *satisfy*. Again what is better than the whole setting of Richelieu's working-chamber, with its Renaissance fireplace and Renaissance cabinets? And these things are not forced upon one's attention: they do not do duty for good acting. There is this indeed, from beginning to end; or at all events a serious effort to attain it.

And yet, if one comes to analyse, if one descends to detail—as all serviceable criticism should, even at the risk of being pronounced dogmatic—there is a good deal to which one must take exception. The secondary characters, played for the most part with spirit, energy, and endeavour, do not receive from their performers that minute and delicate attention which as a matter of course such characters receive at the Comédie Française, and which as a matter of fact they have received hardly less at the Gymnase, thanks to the art-feeling which M. Montigny has infused into the company there. As a consequence, these secondary characters are played best in their strongest moments, when feeling carries all before it, and worst in the quiet times of waiting or trifling talk—times always the truest test of how far acting is artistic. Mr. John Clayton, who did so well as Joseph Surface at the Vaudeville, could not make *much* more, but might possibly make a *little* more out of the part of that fat *fainéant*, Louis Treize. He is least satisfactory in the first of his scenes, where he does not show one a trace of the "divinity" which doth somehow "hedge a king," even if he be a stupid one—it hedged all our later Georges, and that is saying a good deal for it. But of course it is a nice question how far a monarch who knows painfully that all his strength is outside of himself, will yet conceal the knowledge, unconsciously or consciously—whether *being* powerless, he will invariably *look* so. No one with Mr. Clayton's air of weak acquiescence and weaker protestation could keep a crown for six months now-a-days. But even those who are at issue with the actor as to the reasonableness of the first part of his performance, will admit that he could hardly be better at the end. The final scene, in which, having disgraced Richelieu, Louis is overwhelmed by the receipt of despatches the import of

which he cannot understand—by an access of business he is wholly incompetent to deal with—is full of good touches; Mr. Clayton showing here not only the King's weakness, but the vexatiousness of it, and expressing in the "I'll reflect upon it" not only the feeble monarch's recourse to delay, but likewise the utter hopelessness of the delay. The representatives of De Mauprat and Baradas are best in their noisiest and most earnest moments; and herein they differ greatly from Miss Isabel Bateman, who is really powerful only when she does not in the least suspect it. Her part—Julie de Mortemar—is more difficult than effective; and though the sympathies of the audience would surely go with her, she has not many profitable opportunities of calling for their manifestation. Miss Bateman's defiance is more disagreeable than vigorous. In exciting moments the movements of her face are excessive; and she has lost something—though certainly she has gained more—by her aptitude for learning in Mr. Irving's new school of intense and strenuous acting. With her natural gifts it is wholly unnecessary that she should ever fail to be graceful. Is it not equally unnecessary that directly she becomes excited, her accent—perfectly pleasant and pure beforehand—should be such as to jar upon an English ear? There are actresses whose faults no one can mend, and who without them would be

"icily regular, splendidly null."

One leaves such actresses alone, for good or ill. But to Miss Isabel Bateman, with her clear intelligence and her undoubted command of gentle pathos and grace, one owes it not only to speak, but to speak plainly. And now before I pass to Mr. Irving, whose work all London notices, let me record a word of quite unqualified praise of a young and comparatively little known actor, Mr. H. B. Conway, who invests the part of François, the messenger who recovers the lost despatch, with every quality that can give to a short part a strong interest and absolute reality.

I fear it is the tendency of Mr. Henry Irving to be a little spoilt by the indiscriminating applause of the groundlings, who are far better judges whether a passion is violent than whether it is natural and appropriate. He shows no tendency whatever to allow himself to be spoilt in the vulgar way. With him nothing is slurred, nothing is careless. He is as completely absorbed in his part, and is as completely devoted to it, on the hundredth night of the performance as upon the first. And to the conception and representation of each new character he brings original thought, infinite pains, and an experience enriched by keen observation. But he is perhaps inclined to pitch his performance in too high a key, or to break into a high key when there is no reason for it. In a word, there is a tendency to exaggeration. Here and there the strong points which might make him remembered by good judges as a great actor of high passion are ruined simply because they are overdone. Seemingly he is pursued by an insatiable desire—fanned perhaps into a flame by the enthusiasm of the spectators. I commend to him a story of a great French actor of an earlier generation than ours, who, being complimented one night on the vehemence of his passion, the vigour of his performance, said quietly and regretfully, "No, I did not act well to-night. You are quite in error about it—I was no longer *master of myself*." And either Mr. Irving could often say this truthfully of his own performance or else—and this is worse—he, being master of himself, has deliberately pitched the key too high. No one should object to the horror of *The Bells*: the circumstances there required it. No one has anything but praise for the pathos of *Charles the First* and the subtle rascality of the *Two Roses*. But in *Eugene Aram*, Mr. Irving dies all over the stage—a cat has nine lives, and Eugene Aram nine deaths—his final release cannot possibly be a greater comfort to him than it is to ourselves—and in *Richelieu* the outbreak of his rage is excessive: it is more likely to have been studied in madhouse cells than in the cabinets of statesmen. But fortunately for Mr. Irving and for the playgoing public, there are two circumstances which do mark him out as a unique and illustrious artist. First there are the many moments when the high passion does *not* go wrong; and secondly there are the longer and of course more numerous periods when vehemence and excitement being out of the question, there is room for the uninterrupted display of sagacious judgment and serious and thoughtful art. Of the really fine

displays of passion and unbridled eagerness, the best in *Richelieu* are those called forth by the misadventure of the despatch. The master's excited appeal to François, the messenger—an appeal that is half a threat and half a wiser and more genial encouragement—is worth an effort to witness. The touches of quiet art elsewhere are very numerous and very admirable. The suppressed cough of a worn-out old man, the physical feebleness, the mental activity and energy which exact from this weak body the utmost jot of its service, the unwilling recognition of a creeping decay, the sigh for an hour of youth—all these are represented with a power of suggestion which creates as well as interprets. A hundred touches go to make up the picture of this Richelieu, and I ask the spectator to notice particularly one subtle moment of gesture and expression, when the Cardinal, having forgiven De Mauprat and granted him the hand of Julie, cannot listen to his thanks. That moment is of exquisite truth, for it reveals the semi-cynical good-nature of an old man high in power, for whom the raptures of the young are dead or trifling things—the semi-cynical good-nature of one to whom a stray act of forgiveness seems as slight and whimsical an incident as the flinging of a chance bone to a hungry dog. There is no touch of human sympathy—but a moment of wanton good-humour—and then the all-important work for France is resumed and found absorbing. Personal pleasure, personal good-will!—there is no room for these in Richelieu's life, when he is busied with a thousand affairs. It is by touches of character like this that an actor earns that title to greatness which, with all his failings, cannot, I think, be justly denied to Mr. Irving.

FREDERICK WEDMORE.

#### NOTES ON ART.

A volume of fine etchings lately published in Paris, accompanied by a "Study" of the artist by Alfred Sensier, has revealed an almost unknown master to the general public. This master is Georges Michel, a French painter but little appreciated in his lifetime, but on whom connoisseurs now bestow the title of "the French Ruysdaël." Georges Michel died about thirty years ago, after having executed a vast amount of work. "It is by thousands," says his exponent, "that his harsh landscapes, his angry skies, his twisted trees, and his extensive plains may be reckoned." Nothing it appears was too mean for this lover of nature to reproduce. Not only, like Reynolds, could he find light and shade in a cocked hat, but he even studied its effects in sewage outfalls. He loved his Paris and his Montmartre so much, says his widow, "qu'il allait jusqu'à peindre les dépotoirs de Pantin." Once when returning from this odorous employment, "Tiens," he remarked, "c'est comme un torrent de Suisse, et c'est même d'un bien plus beau ton, c'est doré comme un Cuyp."

Such a realist as this, unrepelled by the most unfavourable aspects of nature, choosing indeed to paint her in her gloomiest and most discordant moods, would doubtless find thousands of subjects for his art. He seems indeed to think it no part of his work as an artist to select and idealize, but sets himself to paint things

"Just as they are, careless what comes of it.

God's works—paint any one, and count it crime  
To let a truth slip."

M. Alfred Sensier has done good service to art by reviving the remembrance of this hitherto neglected artist, but whether the praise of connoisseurs and the demand this praise has at last created for his work will be lasting it is difficult to say. It is possible that Georges Michel is now as much overrated as he was underrated in his lifetime.

A third edition of *William Hogarth's Zeichnungen*, with critical explanations by G. C. Lichtenberg and a biography by Dr. Franz Rottenkamp, has just been published in Germany. German critics have always shown a high and fine appreciation of our great national artist, whose pictures, as the prospectus of the above work truly remarks, belong not only to the "history of art, but also to the history of culture."

We learn that a German translation by Professor Springer of Messrs Crowe and Cavalcaselle's *Early Flemish Painters* will appear next spring. Mr. Murray is about to issue Mr.

Crowe's edition, in great part re-written, of Waagen's *Kugler's Handbook to Art*.

M. Emile Chatrousse, a distinguished sculptor, writes to the *Chronique* to complain of an amusing piece of prudery on the part of a French abbé.

M. Chatrousse had contributed to a horticultural fête at Pontoise a statuette of a child three years old holding up some grapes in its little shirt. This statuette, which was called "La petite Vendangeuse," attracted much admiration on the first day of the show, but on the second it was found to be missing, and no one could tell where it had gone. The matter was at last put into the hands of the police, who some days after discovered it under a heap of rubbish. Only then did M. l'abbé, the curé-doyen of Pontoise, come forward and state in the local paper that he "alone, in the night, and without accomplice, had torn down the indecent figure from its pedestal and had thus spared the town six days of scandal." The indignant artist speaks of his work as "une inspiration de père de famille." No doubt it was this source of "inspiration" that drew down upon the pretty little statue the wrath of the virtuous and celibate iconoclast. He had unfortunately no nursery reminiscences to soften his heart towards the "indecent" of undressed baby. Truly this "vengeur de la décence publique," as he calls himself, may rank with the inquisitors of the sixteenth century in Spain, who considered it immoral to represent the Infant Saviour unclothed, and warned artists against painting even the naked feet of the Virgin.

The honours of M. Alma Tadéma accumulate. This able painter has just received the *Croix de la Légion d'Honneur* for his picture of the "Vintage," exhibited along with the "Mummy" in the last Salon. This distinction is the more gratifying because of the law passed last year limiting the number of Crosses allowed in one season to foreign artists, to a single one. Last January the Queen distinguished Alma-Tadéma by granting him at once Letters of Denization, although the legal term of five years' residence had not been accomplished.

Besides M. Alma Tadéma, MM. Robert-Fleury, de Neuville, Heuner, and Dettaille, painters, and MM. Schoenewerk and Hiolle, sculptors, have been named Chevaliers of the Legion of Honour.

The Mayor of Liverpool, Mr. A. B. Walker, has undertaken to provide an Art Museum in that town at his own expense. The designs for the new building are being prepared by Cornelius Sherlock and Henry H. Vale, architects in Liverpool, and it is estimated that it will cost twenty thousand pounds.

The *Zeitschrift für bildende Kunst* contains two etchings this month from pictures of Rembrandt's early time, before he became the great "King of Shadows." One of these, "St. Paul in Prison," is the first dated picture that we have by him. It was painted in 1627, and is at present in the Royal Museum at Stuttgart. The other, a "Repose in Egypt," etched by Léopold Flameng, is more like what we know of Rembrandt's style; still, if the etcher has represented it faithfully, the painting must lack the power of the master's later time. Rembrandt's first wife, Saskia, evidently inspired the painter with his conception of the Virgin, for we have here the same pleasant face as in the well-known portrait of that lady seated on her husband's knee. A short article by Dr. Woltman accompanies and elucidates the two etchings.

The mysterious disappearance of the well-known bronze statue of Napoleon I. commonly called "Le petit corporal," which our readers will remember as formerly standing on the top of the Colonne Vendôme, but which within the last few years has been removed and placed at the *ronde-point de Courbevoie*, has caused much speculation and talk in Paris. It was asserted in some of the journals that the Communists had thrown it into the Seine, where it still remained; others reported that it had been fished out of the water and had not suffered the least damage; while the inhabitants of Courbevoie assured inquirers that the statue had been decapitated by the Communists, but that its head had been piously preserved by the Mayor as a relic.

None of these statements however seem to be correct, at least a more satisfactory explanation is now offered of the mystery. The *Moniteur des Arts* informs us that the statue was, it is true, thrown into the Seine in the night of the 20th September, 1871, not by the Communists, but by order of M. Cresson, préfet of police, in order to preserve it from injury. When the disturbances in Paris were over it was taken out of the water and removed to the dépôt for the government marbles in the rue de l'Université, where it still remains, in company with the statue of Louis XVI. and those of many other dethroned rulers who lie there waiting for the restoration of their dynasties, when they hope once more to be hoisted to their pedestals. "Le petit Corporal" has unfortunately had its head broken off in its vicissitudes, but in such manner that it can easily be restored. This statue, which is dear to all Frenchmen, was the work of M. Seurre, and has great artistic merit. It is thought probable that it will again be placed on the top of the restored Colonne Vendôme, the figure of the first Emperor in Roman costume, which has more recently stood there, having been utterly destroyed.

The last number of the *Archæological Journal* contains an interesting article on "The Architecture of the Eleventh Century," by Mr. J. H. Parker, in which he maintains his previously expressed conviction that the churches of the Anglo-Saxon period in England were with few exceptions built of wood, and that it was only in the eleventh century that stone came fairly into use for building purposes. "For many years past," he writes, "I have been hunting for buildings of the tenth century with very little success. It is a matter of history that some stone buildings were erected at that time, but there is very little construction of that period remaining in any of them."

"Les Adieux," by M. C. Tissot. This picture of lovers parting, which some of our readers may remember, has been admirably engraved by Bellin. The print is on a considerable scale, so as really to carry out the full impression of the painter, and has besides a certain charm in the execution of the engraving which deserves particular mention. For some time on the continent elaborate etching for small subjects has taken the place to some extent of engraving proper, that is to say of work by means of the *burin*. With us this has been the case in large subjects with the addition of mezzotint, but the small etchings we speak of have been toned by a process of another kind, recognisable for the first time on a large scale on this print by Bellin after Tissot, published by Messrs. Pilgeram and Lefèvre. With regard to the subject of "The Adieux," the time is at the end of last century, the lover we may suppose a Girondist going to his fate in Paris, and the girl he parts with, she within and he without the gate of her father's domain, has no power to keep him. It is a little episode in a great drama singularly well told.

The sixteenth part of the *Allgemeines Künstler-Lexikon* has just reached us. This wonderful republication, which is in fact a new work, is edited by Dr. T. Meyer, and was commenced in 1870. The present part only comes down to "Auden—Aerd"; nearly three years for one letter of the alphabet! It will doubtless be useful to our children or grandchildren.

## Theology.

**A History of the Catholic Church of Jesus Christ from the death of Saint John to the middle of the second century.** By Thomas Wimberley Mossman, B.A., Rector of Torrington, Lincolnshire. London: Longmans.

THIS work is scarcely a history in the ordinary sense of the word. It is rather a series of essays, sometimes discursive enough, but always animated and interesting, on the history and literature of the post-Apostolic Church. Hence there is a want of proportion between the parts, which cannot fail to strike the most hasty reader, and while the legend of a saint is detailed in many pages, the authenticity of a gospel is settled in a few lines. Mr. Mossman does not, perhaps, pretend to write with the impassive calm of the purely philosophical historian. He is an intense believer in Christianity, of which he regards the incarnation of God in Christ as the essence, but within that limit, and indeed, it is fair to add, some way beyond it, he is broad-minded and charitable; while his tenderness to the so-called heretics, whose views in reality sometimes represented the teachings of the founders of Christianity more accurately than those of the majority who claimed to be the Catholic Church, contrasts favourably with the spirit in which ecclesiastical history has too often been written. Of the writings of the early Fathers his knowledge is extensive and minute, and as he has evidently studied them with care, and endeavoured to arrive at their meaning without regard to pre-conceived ideas, his conclusions are always deserving of consideration. If he is equally well read in the critical literature of Germany, it is not evident from these pages.

The most interesting part of this work is that which deals with the two greatest heresies of the early Church, that of the Ebionites and Montanism. Mr. Mossman avows his conviction that there are only two sects at present existing which the primitive Church would not have received into her bosom, namely the Unitarians and the Society of Friends, and it is with much hesitation that he excludes even these. In fact, when he comes to deal with the Ebionites, he finds himself compelled to admit that there was a large body of persons living at Jerusalem in immediate connection with the Apostles who had no belief in the Deity of the Saviour, and this accordingly suggests the question "whether, or not, a pro-

fession of belief in the true and eternal Divinity of Christ was necessary for admission into the Apostolic Church of Jerusalem?" And here is his answer to his own question; "Not only was this belief apparently not required, as of necessity; but if we will throw off all prejudgments and prepossessions, and read the opening chapters of the Acts of the Apostles, and especially St. Peter's speeches, as we would any other writings, we can come to no other conclusion." The explanation is, of course, that which has been usually, perhaps invariably, given by those orthodox writers who have admitted the fact, namely, that the doctrines of the Trinity and the Incarnation were intentionally kept in the background in order to facilitate the conversion of the Jews. But whether this explanation is satisfactory, or whether the Ebionites did not in fact preserve the whole doctrine of Jesus and his apostles more faithfully than the Catholic Church, is a question the answer to which must depend, for the critic at least, on the view taken of the authenticity of the gospels, and especially of the gospel of John. However that may be, it is not easy to see how Mr. Mossman's conclusion can be evaded. The Ebionites had clearly standing ground within the Catholic Church according to its original constitution. But when, not contented with toleration, they insisted on formulating their dogmas, and making them the standard of orthodoxy, it then, according to our author, became inevitable that they should be excluded as heretics.

Undoubtedly one of the most extraordinary and interesting phenomena connected with the history of the early Church was that great outburst of fanaticism which occurred in Phrygia, about the middle of the second century, swept through the Church from East to West, carrying away with it numbers of the most earnest minds, among the rest the learned and eloquent Tertullian, and almost succeeded in extorting a recognition from the Bishop of Rome; which to all appearance revived the apostolic gift of tongues, and claimed to be the fulfilment of Christ's promise of the advent of the Paraclete. "Montanism," says Mr. Mossman, "seems to have been at its outset, an attempt to solve the great problem of the true position of woman in the Church of the Lord Jesus Christ." Such a statement is one-sided, though it is undoubtedly true that this question rose into great prominence in connection with Montanism. Great emotional movements, whether they are traceable to natural or supernatural sources, know no distinction of sex, and the Montanists, in vindicating the right of women to the possession of the Spirit and to prophesy, were more in accordance with the practice of the primitive Church than the Catholics who denounced them; but obviously Montanism itself created the problem which it tried to solve. St. Paul had made special provision for women prophesying, insisting only that they should do so with their heads covered; but, unless 1 Cor. xiv. 34, 35 be an interpolation, as Mr. Mossman suggests, he had at the same time forbidden them to speak in the Church under ordinary circumstances. When therefore the spirit of prophecy died away, women naturally ceased to be prominent or to take any part in the public services of the Church. When the Montanist enthusiasm broke out it was impossible that it should be confined to one sex. The beautiful legend of St. Thekla, which is given here in full, has a very interesting connection with this subject. Mr. Mossman takes the indulgent view that it was written in perfect good faith by one who believed it to be true, but who was at the same time fully conscious that it favoured Montanism; and he even contends that it may have some amount of fact at its foundation. All that can be said is that it is not impossible; but when we think of the Clementine *Recognitions*, the *Shepherd* of Hermas, and other such works, and remember that about a century had elapsed since the death

of Paul before the Acts of Paul and Thekla were written, we cannot feel tempted to adopt the supposition.

Another very important question raised by Montanism was that of marriage and divorce. In forbidding more than one marriage, and refusing all opportunity of repentance to adulterers, these heretics only represented a tendency which had existed from the very beginning, and were able to allege certain passages of Scripture in support of their views. The Epistle to the Hebrews states in the strongest terms that for those who have once lapsed repentance is impossible, while Paul, besides disparaging marriage, forbids that bishops at least should marry again; and a sect influenced by a powerful enthusiasm like the Montanists would naturally adopt the most stringent practice. The continuance of this tendency until it became organised in the Phrygian heresy is evident from the *Pastor* of Hermas, which, representing the more generous Catholic view, allows one repentance to those who have committed sins of the flesh. The teaching of the *Pastor* on this point has indeed been the subject of serious difference of opinion. Some of the German critics have regarded the work as adverse to the second repentance and maintained that Tertullian had fallen into a misunderstanding when he spoke of the "Pastor of adulterers," inasmuch as the repentance was allowed only *dum aedificatur turris*, until the completion of the Church. This is quite true, but the answer surely is that the completion of the Church was to be followed by the end of the world, so that in fact repentance was allowed while the world endured. Such an explanation would certainly have failed to satisfy Tertullian, who was violently opposed to all compromise with sinners. Besides, it is difficult to see how there can be any dispute upon the main point, for Hermas expressly says, in reference to this particular question of adultery, in which he includes idolatry, that "there is one repentance to the servants of God." There are indeed some passages which scarcely harmonise with this statement, but on the whole the writing seems to be that of one cautiously urging a view which he knows will rouse strong opposition. It was the view, however, which finally prevailed, though the Montanists made a hard struggle, and might possibly have maintained their existence if they had been satisfied to be a part of the Church, instead of attempting to be the whole. Mr. Mossman's general judgment on these so-called heretics is wise and liberal. "The great error," he says, "into which the Montanists fell, if they did fall into it—for the evidence can scarcely be said to be absolutely conclusive—was that they attempted to enforce their code of discipline, and their counsels of perfection as rules binding upon the whole Church, upon the strong and the weak alike. What they ought to have done was to have formed themselves into an Order, or a Community of Christians, with their own peculiar customs and ordinances. They should have been an Ecclesia or Church within the Church. And this perhaps was what they wished to do, if they had been permitted by the ecclesiastical party: but they do not seem ever to have had the chance, any more than the Methodists were allowed to form themselves into a recognized community within the Anglican Church" (pp. 437-438).

There is one other point which may to a certain extent be regarded as the special subject of this work, and which therefore must not be altogether omitted, "the original organisation of the Christian ministry and the growth of Episcopacy." On this question I need not say much. The evidence for the equality or identity of bishops and presbyters in the early Church, is so clear, the traces of the gradual growth of episcopacy are so plainly impressed on the history of the first centuries, that it is scarcely possible that any unbiassed inquirer should conclude the original constitution

of the Church to have been episcopalian in the Roman or Anglican sense of the word. Whoever thinks the contrary may be recommended to study this work. On this point Mr. Mossman's judgment may be considered peculiarly valuable; for not only is he himself a clergyman of the Anglican Church, but he confesses to having at one time "nearly always found Anglicanism in the Fathers," and it is only since reading them "without looking for anything at all" that he has "discovered comparatively little of it, but a very great deal of what is not Anglicanism." His pages furnish abundant evidence of the original parity or identity of bishops and presbyters. But Mr. Mossman goes far beyond this. He maintains as strongly as any Nonconformist could do the spiritual independence of the Kingdom of Christ, and says, "Sooner or later, the principle will be just as universally acknowledged, as the wickedness of persecution on account of religion is now, that the favouring, or upholding, or establishing, or patronizing any one particular religious body by the State is inconsistent with a perfect belief in the rights of conscience" (p. 162).

A few general remarks may now conclude this notice. Mr. Mossman occasionally puts more implicit confidence in the statements of ecclesiastical writers than perhaps a just criticism would warrant. Thus he speaks of "the indisputable fact that Clement was consecrated bishop by St. Peter." Now it is indeed an indisputable fact that Tertullian says so, but whether Tertullian based his assertion on any adequate knowledge is fairly open to doubt. The presbyterian theory reconciles the otherwise conflicting statements of Irenæus and Tertullian, but because two statements can be reconciled it does not follow that both are true, and in this case the probability seems to be that Linus was fixed on by tradition as the first bishop of Rome simply on account of his being mentioned by Paul in the Second Epistle to Timothy. Again, Mr. Mossman, as we have seen in the case of Thekla, is too much inclined to look for facts where it is tolerably plain that we have nothing but fiction. While admitting that the Clementine *Recognitions* read like a romance he nevertheless contends that there is nothing in them "incredible or even violently improbable." He seems to be carried away by his enthusiasm for Christian antiquity when he calls the description of Nature in Clement's Epistle "a magnificent burst of the highest order of eloquence" (p. 42). It is a fine passage, but there are many finer in the heathen writers, for example the noble argument for the existence of God in Cicero's *De natura deorum*. It is certainly somewhat venturesome to call Simon Magus "a great, original, creative genius" (p. 126). Mr. Mossman does not notice the view which identifies him with the Apostle Paul. Mr. Mossman's views of inspiration are moderate and rational, but in referring to the gift of tongues he will probably be thought to have gone either too far or not far enough. He holds that "the apostles were miraculously assisted by the Holy Ghost to preach in divers languages," but does not consider it necessary to believe "that the gift of tongues ever enabled them to speak and write in Ciceronian Latin or Platonic Greek" (p. 74); to which it might be replied that if the Holy Spirit enabled them to speak Latin at all He must surely have enabled them to speak it correctly. Mr. Mossman is far too fair a writer to hide or misrepresent any fact, whether it makes for him or against him; but his statements are sometimes a little misleading. Thus he tells us that Marcion "did not deny that the Gospels of Matthew, Mark, Luke, and John were really written by the authors whose names they bore, but he impugned and rejected the authority of three of them for other reasons which he assigned" (p. 128). Now, what we know about Marcion is that he made use of a gospel which presented the appearance of a mutilated version of St. Luke, but which many modern critics have regarded, on very strong grounds of internal evidence, as an

earlier and more authentic form of our third gospel. That Marcion knew and rejected the other three gospels, in their present form and under the names which they now bear, is an inference which no doubt Mr. Mossman considers quite warrantable from the somewhat general statements of Tertullian; but Tertullian says expressly that Marcion did not affix any name to his gospel.

I should mention perhaps that this work is put forth as an Eirenicon, but I cannot pretend to share in its author's hopes that it will succeed in healing the divisions of eighteen centuries. If indeed all men would become as charitable as Mr. Mossman, and at the same time believe in the Incarnation, the thing would be done; but so it would if all men would admit the infallibility of Pius IX. The former consummation would certainly be preferable to the latter, but it may be doubted whether either is likely to be speedily attained.

ROBERT B. DRUMMOND.

**The Commentary of Ibn Ezra on Isaiah:** edited from MSS., and translated, with notes, introductions, and indexes. Vol. I., translation of the Commentary; Vol. II., the Anglican version of the Book of the Prophet Isaiah, amended according to the Commentary of Ibn Ezra, by M. Friedländer, Ph.D. Trübner & Co.

THE Society of Hebrew Literature have done well to give prominence to a work on such a subject by one of the most profound and original of Rabbinic commentators, Rabbi Abraham ben Ezra—briefly in Arabic Ibn Ezra—of Toledo (A.D. 1092-1167). The large class to whom the term Rabbinic suggests a futile display of misapplied subtlety will see occasion to *revise* their judgment after some study of the work now presented to them in a comparatively popular form. While showing but slight traces of medievalism, it suggests, as is known to readers of Cheyne's *Isaiah*, the supposed modern theory of the composite authorship of the book; and seems, moreover, to imply a doubt as to the chronology of the "Creation," at the same time maintaining that *bara* in Gen. i. 1 does not mean, to bring into existence from nonentity. The style of the original is marked by a terseness and epigrammaticism to which it is sometimes hard to do justice in a rendering; but the editor, though ignoring the word-play in such passages as i. 24, quotes a characteristic example from another work, where it is said of R. Jonah, who held that there was only one star named *k'sil*—a word also meaning *fool*—that "if there is only one *k'sil* in the heavens, there are many on earth, and he is one of them" (p. 67).

In the Introduction is an account of the author's life and works. What is said about the ways of writing his name is meagre and inconclusive. It is commonly supposed that *ben* is simply the Arabic *Ibn*, but it should have been mentioned, if only for refutation, that some take it as an abbreviation for *Abraham ben*. Even the abbreviation *ben*, for Rabbi Abraham ben Ezra, is unnoticed. The editor writes *Ibn* Ezra in cases where any form *except* *Ibn* is admissible, and does not shrink from the confusion of tongues in Rabbi Abraham *Ibn* Ezra (p. xviii.), where *Ibn* is perversely written for *ben*. In what follows I adopt Dr. F.'s abbreviation, I. E.

I. E. has placed on record, in some verses, that he did not prosper in business: "Were I a shroud-seller men would not die all my days . . . were candles my merchandise the sun would not set till my death"; and yet surely he must have been a practical man, for "It is said that once when he was on board a vessel with some of his pupils, a raging storm compelled the captain to throw every ninth man of the passengers overboard; by means of an algebraical formula, which his mathematical knowledge had

discovered, he placed himself and his party in such a position that the fatal number never reached one of them; but neither the plan of the captain, nor the counterplot of Ibn Ezra is sufficiently known!" He was an observant traveller in Europe, Asia, and Africa, visiting amongst other places England, where he was well received. For some account of his works generally the reader may be referred to the Introduction. I do not know whether it might be fairly said of any of them, that "their text is exceedingly mutilated and corrupt," but as regards the commentary on Isaiah, if all the proposed emendations are to be adopted, the Society's text will be *facile princeps* in inaccuracy. The want of precision in rendering, which creates a difficulty in such passages as xvii. 14: "In the evening the men of Jerusalem were afraid of him," and lo! "before the morning he is not"; and which would commit I. E. to the preposterous statement that the sun and the moon are called "great luminaries *because* they are the cause of rain, but of course only at the will of the Almighty" (xviii. 4); makes it appear sometimes to the reader of the translation, that a trenchant emendation is required; but too many of the "emendations" of any magnitude are seen at a glance to be inaccurate. I proceed to examine a few places more or less in detail, beginning with v. 9; (xxii. 14):—

"To mine ears, *the ears* of the Lord, has come the report of the injustice which you have committed; comp. *Your prophet, the prophet of the Lord* (Numb. xii. 6)." "The *ni* of the Hebrew text in this remark, as well as in that on xxii. 14, is a mutilation of *beni*, *the ears* of; the comparison with the instance quoted, and I. E. on Numb. xii. 6, leaves no doubt about it."

But Dr. F., from his too great addiction to "free translation," has given a rendering of what I. E. for consistency's sake *ought* to have quoted. The following is more like the actual text: "In mine ears, *I* the Lord of Hosts, is this violence that thou hast wrought. Comp. [*I*] *the Lord will make myself known unto them in a vision*"; where the sense is quite satisfactory, and the construction of *ni* is as in Dan. viii. 1. The question, then, is not simply whether *beni* is to be written for *ni* in two passages, but whether in the same two passages we are also to substitute *beni kem* for *bammar'ah elav ethvadda*. I. E.'s comment on Numb. xii. 6 is, indeed, in favour of the change; but he sometimes varies his renderings, as Dr. F. admits (p. 127).

On p. 44 of Vol. II. we are startled by the rendering: "Thy voice shall be, as of a *potter*, out of the ground," etc. (xxix. 4). The comment on the passage is rendered: "As a potter. Comp. *as bottles*. The potter, because of his vocation, speaks from below"; and to remove all difficulty, it is added in a note: "The potter was mostly occupied with his work below the surface of the earth." This catastrophe seems to have resulted from the misreading of a *Daleth*. I. E.'s actual comment is as follows: "*kobh*. Comp. Job xxxii. 19: like new bottles. *For such was their craft*"—the point of comparison being the mode of speaking of the *necromancer* or *ἐργαστήριον*. Compare R. D. K. on the Witch of Endor.

An unfortunate slip is made at xvi. 14: "As the years of a hireling, who daily counts (?) when the end will come, so the prophet is satisfied when he sees that *the time of the calamity of Moab approaches*"; where the true rendering is "*the end of their calamity*"; so that we might have dispensed with the note: "Just the contrary remark is made in Rashi on xv. 5: that the prophets sympathized with other nations in their calamities." The extremely vague suggestion in note 3, p. 93, is superfluous, since the text yields a good sense as it stands. The "desert of the sea" is explained of Babylon: the Persian enemy "cometh from the desert," *but not from the sea*; which is a terse way of

warning the reader that the second *milbar* is not to be confounded with the first. A strangely illogical alteration is made on the following page. I. E. makes Belshazzar begin to speak in the middle of xxi. 2: "All the sighing thereof have I made to cease;" but Dr. F. reads as follows: "I think that the whole passage, *from the beginning of this verse* till the end of the chapter, is the speech which the prophet puts into the mouth of King Belshazzar." It is true that at the beginning of the verse I. E. writes: "A prophecy grievous to Babylon has been announced to me—words of the prophet. . . ." but Dr. F., not in the least disconcerted, writes in a note: "This is not the opinion of I. E. himself, as he remarks below in this same verse; the first person refers to Belshazzar, who is here represented as speaking." Thus a plain statement of the author cannot express his meaning, because it does not agree with a conjectural emendation of the editor. The further proposal to read: "they [for *he*] drank," proceeds upon a misconception. Comp. ver. 4: "The night of *my* pleasure. The night in which *he* drank out of the holy vessels."

An elaborate argument is based on the assumption that the prophet "speaks his own words," in xxxiii. 18; whereas I. E. merely writes, in explanation of *yehgeh*: "Thine heart shall *say within itself*." In a note on xxxviii. 21 it is proposed to interrupt the discussion on *figs* with the remark that two verbs are *in the imperative*, when, as it happens, they are not. But we might read, "like *cakes* (*maççoth*)," instead of "in the imperative." The emendation at xl. 18 cannot be accepted; but since *אֱלֹהִים* might easily be corrupted into *אֱלֹהִי*, the sense may be, that EL, " = *Elohim*, without the article. Comp. Josh. xxii. 22: [EL] *Elohim*, he knoweth." On xliii. 2 read *sarim*, *enemies*, for *sarim*, comparing xlvii. 14. There is certainly a difficulty at the commencement of chap. l.; but we shall not be far from the truth, if we say that the repudiation of "your mother" involves that of yourselves, regarded as the wife's *sons* — *בָּנֵי* for *אֲנִי* — which makes a transition to the plural, "I have sold you." Comp. lx. 1, 4, 8; lxiii. 16. R. D. K. mentions the *sons* expressly. It is remarked in a note on p. 299, that I. E. "refutes the opinion of Rashi, that *סָרַם* = *אֱלֹהִי*." But a later writer, R. S. Dubno, charges I. E. with misrepresenting Rashi.

It is evident from these specimen passages that the Society's edition of this valuable commentary is not without its blemishes; but though there is room enough in it for improvement, it may be welcomed as an attempt to supply an acknowledged want. Its mechanical execution is satisfactory, and typographical errors in the Hebrew are exceptional (pp. 82, 86, 269), though the same cannot be said for the Arabic (pp. 97, 175, 202, etc.). Certain of the minor conjectural emendations may be accepted, and some good readings have been contributed from the British Museum MS., Add 24896. Many of the notes contain valuable matter, but others are mere repetitions of what has been already stated in the text. It is to be hoped that Dr. Friedländer will continue his labours in the cause of Hebrew literature, for, though lacking the instinct of textual criticism, he may still do good service if he will be content to illustrate his author and record the variations of the MSS.

C. TAYLOR.

#### NOTICES OF NEW BOOKS.

*Prophecies and the Prophetic Spirit in the Christian Era. An Historical Essay by J. J. I. v. Döllinger.* Translated with Introduction, Notes, and Appendices by A. Plummer, M.A. Rivingtons.

It was said of Pearson that his very dust was gold, and so the translator seems to think of Dr. Döllinger. Yet it may be asked, if even chips from the workshop are to be enshrined so luxuriously, how is the

student to become acquainted with a title of the best fruits of continental scholarship? What a contrast is afforded by the unpretending little German volume (Raumer's *Historisches Taschenbuch* for 1871) from which this monograph is taken! The subject is happily chosen, and is of itself a sufficient recommendation; it is those singular outbursts of the prophetic spirit, which, not entirely unknown in our day, were especially frequent in the Middle Ages. Religious, dynastic, national, and cosmopolitan, such are the heads under which the Christian prophecies are arranged, those relating to the Church being included under the last; and the names of Merlin, St. Martin, S. Catherine of Siena, Fra Dolcino, Abbot Joachim, Roger Bacon, Dante, Savonarola, will show the variety and extent of the learned author's researches. Appearing in a historical periodical, it was natural that the essay should assume a purely historical character. But the theological bearings of the facts are well explained, agreeably to the spirit of Dr. Döllinger, in the introduction by the translator, who contrasts the grotesqueness and unworthy objects of the mediaeval prophecies with the simplicity and high moral purpose of the Biblical ones, and infers the superior credibility of the latter. The argument, as he himself points out, is similar to Canon Mozley's in the Bampton Lectures on Miracles. *Adhuc sub judice lis est.* Until the subject of prophecy, and in particular the facts of Biblical prophecy, have been subjected to a more thorough and more impartial investigation, too unqualified statements on either side can only lead to misconception. It is but just to add that the translation is an accurate reproduction of the chaste simplicity of the original. The notes added by the translator are distinguished by brackets, and are useful; still higher praise is due to his appendices on A. The Lehnin Prophecy [a further discussion of this subject is reserved by the author]; B. Instances of persons prophetically summoned to appear before the tribunal of God; C. Theories respecting Antichrist; D. Merlin. The few trifles which follow may be of use in a second edition. P. 16; it might be added that Arndt in 1805 predicted that the Spaniards would be the first to rise against Napoleon. P. 20, comp. p. 79; the formula "appropinquante mundi termino" was the reverse of "a familiar one" in the tenth century. It began to be in use in the seventh, was a standing formula in the ninth, and went out of fashion for a time in the tenth. See the learned Benedictine, Dom François Plaine, *Rev. des questions historiques* 1873, who refers to de Wailly's *Éléments de Paléographie*. P. 52. For the application of the visions of the Apocalypse to Papal Rome, the translator should have referred to Gabriele Rossetti's *Sullo Spirito Antipapale di Dante*, translated under the title *Disquisitiones on the Antipapal Spirit which preceded the Reformation*, 2 vols., Lond., Smith & Elder, 1834 (a scarce book). P. 82 note; omit rash philology. P. 101 note. It is worth noting that from Cathari comes the German *Akzür*, heretic. P. 132. Notion of Dante's heterodoxy unfounded. Comp. a neglected poem by Piero Allighieri, son of Dante, in which, besides an interesting reference to the poet's musical productions, there occurs an indignant contradiction "of those who would say that the master of the faith was in error," concluding with the energetic verse, "Se fosse spenta" [la fide], "rifarià Dante" (Trucchi's *Raccolta* ii. 148). We learn with regret that it is doubtful whether the author's supplementary essay on "Dante as a Prophet" will ever see the light. A glimpse of his view is however afforded by an expression on p. 130: "Dante, who, although in a way peculiar to himself, was also a Joachimite," and by a reference to a paper by Dr. Döllinger in Dr. Preger's important essay, "Dante's Matelda," in the *Transactions of the Munich Gesellschaft der Wissenschaften* for the current year. It appears that both Dr. Döllinger and Dr. Preger take Dante's Greyhound, "il Veltro" (*Inf.* i. 101), collectively, as a reference to a religious order of preaching ascetics, similar to the order predicted by Joachim, and described at p. 118 of this volume.

T. K. CHEYNE.

*Hermeneutics of the New Testament.* By Dr. A. Immer. Wittenberg: Koelling. 1873.

THIS work of Dr. Immer's reads very much like a course of professorial lectures. We can believe that it would make a useful manual for students in theology, but we doubt whether it will either serve to convince those who differ from the views of the author or add very much to the knowledge of those who substantially agree with him. Distinctly the best portion is that which deals with exegesis. The rules laid down appear sound and sensible; the illustrations are worked out with clearness and method; and the analysis of detached passages shows thought and care, as well as considerable flexibility of mind.

On the other hand the sketch of the history of New Testament Hermeneutics and the treatment of the auxiliary branches seem to us less satisfactory. The historical sketch errs, as sketches of this kind are wont to err, both from excess and defect; partly for want of a sufficiently strict definition of the limits of the subject. Why, for instance, should the name of Gesenius be included (in an account of New Testament Hermeneutics) and that of Ewald entirely omitted? Why, again, should writers on the Biblical Theology of the New Testament find a place in the history which is denied to Biblical Theology itself in the body of the work; and why amongst these should

Schwegler and Scholten appear, while Reuss and Weiss and Ritschl are passed over? Why, lastly, should we be told at some length that Schulthess, Storr, Süskind, and the two Flatts are not important for New Testament Exegesis, while we hear nothing at all of exegetes of real note such as Hammond, Godet, Ellicott, and J. B. Lightfoot? But for the bare mention of Mill, J. Lightfoot, and a few geographical works, Dr. Immer would not seem to be aware that England had made any contribution whatever to the study of the New Testament. There may be too much excuse for this ignorance; but it has certainly lessened the value of Dr. Immer's work in more ways than one.

For instance, if he had known more of the recent history of text-criticism in England his treatment of this part of his subject might have been more complete. The same may be said of the section on Geography. The series of questions that are raised in regard to the topography of Jerusalem either should not have been touched upon at all, or else gone into more thoroughly than they are on p. 215. Neither are the data of the chronological problems in the section which follows given with any fulness. Caspari's *Chronologisch-geographische Einleitung in das Leben Jesu* and Wieseler's *Beiträge* should have been noticed.

However, it is clear that Dr. Immer has thrown his strength less into these parts of his work than into that which is concerned with exegesis proper. Here, if he does not quite reach the precision and scholarly tact of writers like Winer, Ellicott, or Meyer, still he is, as we have said, sound and judicious, and his method deserves attention.

The last division of the book is taken up with the relation of the commentator "to the religious interest." With regard to this it seems to us that little is to be gained by rule and precept. In this more than in any other field it is true that "le style c'est l'homme."

W. SANDAY.

The second and last part of Ibn Hisham's commentary on Ka'b ben Zoheir's celebrated *Qaḥida* for the praise of the prophet, edited by Ignatius Guidi, has just appeared (Brockhaus, 1874). Commentaries on difficult poems by so accomplished a grammarian as Ibn Hisham (died 1359) are a great contribution both to Arabic grammar and lexicography. M. Guidi, who, as is shown by his own notes, written in Arabic, is well acquainted with the idiom of the Arabic grammarians, has given us a correct edition of the book, though he had only at his disposal the Vatican MS. and a collation of the most difficult passages from the Paris MS. The author's own additions and those of Prof. Fleischer are of great value for the correctness of the text. The six indices, viz.: 1. of the verses, 2. of the names of men, women, and tribes, 3. of the names of places, 4. of the names of books, 5. of words explained by the author, and finally, of the terminologies occurring in Ibn Hisham's commentary, facilitate greatly the use of the book.

Dr. Quarry has brought out a new edition of his *Genesis and its Authorship* (Williams & Norgate). The candour and thoroughness with which he handles a difficult subject have, we trust, been acknowledged by most competent judges. It is with regret however that we observe the sensitiveness of the "Notices of Animadversions of the Bishop of Natal" prefixed to the new edition. Would it not have been more dignified in the author to have "wrapped himself in his virtue," and trusted his reputation to his readers, and more regardful of the interests of the latter to have re-written and corrected not a few passages of his work, which seem deficient in comprehensiveness of view or clearness of exposition? The few lines inserted here and there in brackets in the new edition consist mainly of additional references, and are altogether beneath the occasion.

The first volume of *The Bible for Young People*, translated from the Dutch by Mr. P. H. Wicksteed, is now complete (Williams and Norgate). Its general purpose has been already described; we need only add that it is the work of an accomplished Biblical scholar (Dr. Oort), who has here at least kept his dangerous talent for conjecture in check. The work has been revised by Drs. Hooykaas and Kuenen, and the translation by Dr. Oort. The propriety of putting the results of advanced criticism before "young people" may perhaps appear questionable, but no older reader can rise from the perusal of the book without admiration for the learning so gracefully and modestly condensed, and respect for the moral earnestness with which some at least of the lessons of Genesis are inculcated.

It would require a close examination to do justice to the minuteness of the labour which Dr. Delitzsch bestows on the revision of his commentaries; see for instance the first volume, "corrected and enlarged," of his important work on the Psalms, which has just appeared in a third edition. In the preface, he acknowledges many suggestions from his English translator, Mr. Bolton, and refers throughout to the new edition of Hupfeld by Riehm, &c. The most important additions relate, as usual, to Hebrew etymologies. The author does not seem however to have observed Dr. Weir's emendations of the text of the Psalms in various numbers of the *Academy*, though a student of English, nor to have met with the commentaries of Dr. Kay and Canon Perowne. Perhaps too some attention might have been given to the striking though often adventurous suggestions of Dr. Grätz in his *Monatsschrift*.

It is impossible to find a good word for the unhappy translations of

Keim's *History*, vol. i., and Baur's *Paul*, vol. i., which have lately appeared in Messrs. Williams and Norgate's new series. The difficulties of the task are obvious, but cannot excuse the translator's gross ignorance, not only of technical terms, but even of grammar; we are glad to hear that effective measures have been taken for preventing a recurrence of this sad mishap.

Dr. Delitzsch has also brought out a tale of Jewish life in the time of King Herod Agrippa, called *Durch Krankheit zur Genesung* (Leipzig, Naumann). The local colour is faithfully given, in which the author was largely aided by his remarkable familiarity with the Talmud, and the interest of the narrative is well maintained.

Dr. Meyer has been more fortunate. The translation of his commentary on the N.T. (Edinburgh, T. and T. Clark), so far as it has gone, may vie for substantial accuracy with the best efforts of this kind, as indeed was only to be expected from the character of the editor, Dr. Dickson, well known as the translator of Mommsen's *Rome*. The revision, of which the latest results are here incorporated, was the last work of its distinguished author, who passed away on the 21st of June last. Dr. Meyer was born, as we learn from the editor, on Jan. 10, 1800, and began his commentary as a plain country clergyman about 1831. Honour to his memory!

### Intelligence.

The Rev. T. W. Nutt, sub-librarian of the Bodleian Library, is about to bring out a fragment of the Samaritan *Targum* (end of Leviticus and Numbers), contained in an old MS. of the Bodleian Library. Mr. Nutt gives in the preface a full account of the history of the Samaritans, of their theology and literature.

Mr. H. Mathews, B.A. (Exeter College), will shortly bring out Ibn Ezra's inedited commentary on the Song of Songs (according to the MSS. of the Bodleian Library and the National Library in Paris) with an English translation.

### Physical Science.

The Threshold of the Unknown Region. By Clements R. Markham, C.B., F.R.S., late of H.M. Arctic Ship "Assistance." With nine maps. London: Sampson Low.

THE unknown region to the borders of which Mr. Markham leads us is the most important space of the earth's surface yet unsubdued to knowledge, surrounding the Arctic pole and extending over an area of more than forty Englands.

King Alfred told the story of the first expedition to explore these hidden lands as early as A.D. 890, and till recent years Britain was ever foremost in conquering new ground from the unknown area; but since 1845 no British national expedition has been despatched to the Arctic seas, and other nations of Europe have taken up this task, and are yearly gaining that experience in polar travel which formerly was ours alone. The time has surely come for England to resume her place in the van of Arctic discovery, and no better plan could have been devised to rouse English enterprise again than that which has been taken by Mr. Markham in his clear and manly narrative of what has been done and what still remains to be done in this great field of research.

"Unlike the ocean-girt region of the Southern Pole, the Northern Polar region is surrounded, at a distance of about

1,200 miles from its centre, by the three great continents of our planet, while the enormous glacier-bearing mass of Greenland stretches away towards the Pole for an unknown distance. There are three approaches by sea to this land-girt end of the earth: through the wide ocean between Norway and Greenland, through Davis' Strait, and through Behring's Strait—one wide portal and two narrow gates." The wide ocean portal from the Atlantic was the first through which man sought to reach the mysterious regions of the pole; the story of the voyages made in this direction from the earliest to the most recent times forms the first part of the volume. Here are detailed, in pages full of interest, the earliest voyages of the discovery ships of the Muscovy Company of England, fitted out under the superintendence of the veteran Sebastian Cabot, opening the way towards Greenland and Novaya Zemlya; then the hardy voyage of Barents, who in seeking a passage round the north of Novaya Zemlya discovered Spitzbergen, and whose crew first braved the rigours of an Arctic winter; next that of Henry Hudson, in a little craft of eighty tons, to a high latitude on the east coast of Greenland and along the ice-edge to the north of Spitzbergen; the English and Dutch whaling voyages which followed, and through which a knowledge, almost as complete as we at present possess, of the Spitzbergen archipelago was obtained; the voyages of the Scoresbys; of Phipps with Horatio Nelson as midshipman of his vessel; of Buchan with Franklin as his lieutenant; and of the Russian Admiral Lütke to northward between Spitzbergen and Novaya Zemlya. At a certain line of packed ice of from ten to fifteen feet in thickness, somewhat further north in some years, and more southerly in others, every one of these voyagers was compelled to turn back, and all conclusively proved the impracticability of sailing to the North Pole. To these followed Parry's gallant attempt to march to the Pole over ice with boat sledges, and he, leaving his ship to northward of Spitzbergen, pressed on, over ice, to the highest latitude ( $82^{\circ} 45'$ ) which has yet been attained in the Arctic region.

The German and Swedish expeditions directed towards this side of the unknown area are next passed in review; and these have done much to add to the more exact geography and meteorology of this apparently closed gateway to the pole. The older voyages of Barents, and more recently of several Norwegian fishermen, have shown that for several months in summer and autumn the seas to eastward of Novaya Zemlya are free from ice; so it seems probable that a vessel might be navigated in this direction to the "*polynia*" or open water reported by Russian explorers in the Siberian Seas, and possibly thence to northward. This is the route chosen for the Austrian national expedition under Payer and Weyprecht; the chief vessel of this expedition was last seen steaming round the north of Novaya Zemlya, and is now beginning its second winter in the Arctic region somewhere to north of Asia.

Mr. Markham turns now "to examine the voyages up Baffin Bay, where through great dangers and hair-breadth escapes a less formidable pack has for many years been annually encountered, battled with, and overcome." Davis, of Sandrudge in Devon, in 1585 was the discoverer of the broad strait between Greenland and Arctic America, and Baffin following in 1616 passed through it to the bay which bears his name, discovering also the numerous sounds and channels which lead out of it to north and west; but it was not till 1817 that British whaling voyages began to be made in the bay round which a large fleet now annually passes.

Baffin discovered the entrance to the sound named from Sir Thomas Smith, the then head of the East India Company, which leads directly north from his bay. This seems

to be the most open gateway to the unknown region, and is the only point in its borders in which lines of coast are known to stretch away towards the pole. Through this sound Dr. Kane in 1853, Hayes in 1860, and Hall in the past year have successively advanced further north, the last named voyager having attained a higher latitude ( $82^{\circ} 16'$ ) than has ever before been reached by ship in the Arctic region—to within forty miles of the parallel gained by Parry in boat sledges over the Spitzbergen ice.

To Franklin, seeking a north-west passage round America to the Pacific, and to the expeditions fitted out in search of his missing vessels, under Belcher, Richards, McClintock, Osborn, Maclure, Collinson, and others, is due the whole of our knowledge of the archipelago which stretches from Baffin Bay westward to near Behring Strait; and each step in advance in this desolate archipelago, every point of which is memorable for some hardy achievement, is clearly followed by Mr. Markham, himself experienced in battling with the ice in this border land of the unknown.

From Behring Strait along the whole of Northern Asia completing the circuit, where the great Siberian rivers reach the Arctic Sea, our knowledge is entirely derived from the Russian explorers; and the story of the voyages made by Behring, by Chelyuskin, from whom the northmost cape of Asia is named, by Liakhof, the discoverer of the New Siberian Islands with their rich stores of mammoth bones, of Anjou and Wrangell venturing boldly out in dog sledges over the sea ice, forms another chapter of the highest interest.

Summing up the evidence collected all round the threshold of the unknown region, Mr. Markham proceeds to decide upon the best route for future Arctic exploration.

"As routes by Behring Strait and the Siberian seas are left out of the question for the present, as regards an English expedition, the number of routes by which the threshold of the unknown region may be passed is reduced to two—namely, the sea between Greenland and Novaya Zemlya, usually called the Spitzbergen route, and Smith Sound at the head of Baffin Bay." Contrasting the Spitzbergen route with that offered by Smith Sound, Mr. Markham decides unhesitatingly in favour of the latter.

"Since the days of Barents (1596), expedition after expedition has vainly attempted to make discoveries by the Spitzbergen route. The polar pack, constantly drifting south, has hitherto barred all progress in that direction," and "no valuable results in geology, botany, ethnology or geodesy could be obtained under any circumstances."

By the Smith Sound route, on the other hand, a favourable position can always be secured by ships; by this route also many hundreds of miles could be certainly examined by sledge parties; and there is ample supply of animal food to be found.

The final chapter is devoted to the results which are to be derived from such an exploration, and Mr. Markham shows well that there is no branch of science which would not benefit thereby. Besides the addition to be made to actual geography, the investigation of the temperature of the ocean in these regions would throw much light on the great thermal movements of the ocean; without actual observation in these regions, knowledge of oceanic circulation must remain in its present theoretical and unsatisfactory state. In geodesy, pendulum observations near the pole are requisite to complete the determination of the form of the earth; investigation there would advance geology both in its scientific aims in elucidating the past physical history of the globe, and in its practical results by the discovery of valuable minerals; the flora of the Arctic region, though scanty, has been found to possess the greatest interest as pointing to vast changes in the condition and climate

of these regions ; the results to zoology would be of exceptional interest. "Seas which support whales and seals must be tenanted by myriads of fish and of those minute organisms which are disclosed by the dredging machine, while the presence of walrus tells us of submarine forests of sea-weed." The movements of a remarkable group of birds which annually disappear beyond the ken of man into this northern area, where some attractive spot must exist to account for their migration, would be solved by such exploration. For anthropology also there would be gain. "Although barely one half of the Arctic regions has been explored, yet abundant traces of former inhabitants are found throughout their most desert wastes, where now there is absolute solitude," and many considerations lead to the conclusion that a people may still exist north of Greenland who have for generations been isolated from the rest of the world.

"The same enterprise, courage, endurance, and presence of mind are required to conduct an Arctic expedition as to face an enemy in the field ; though in the former case these qualities are merely exercised in advancing civilization, extending knowledge, and exciting friendly sympathy and interest throughout the world.....Now, then, is the time for Old England to take her place once more in the van of Arctic discovery."

The volume is very appropriately dedicated to Sir George Back, the sole survivor of the party which under Franklin crossed the frozen lands of Arctic America.

KEITH JOHNSTON.

### Notes on Scientific Work.

#### Geography.

**The Andes of Chile.**—The sheets of the newly-completed topographical and geological survey of Chile, carried out by Government under the direction of M. A. Pissis, have been received by the Royal Geographical Society. They give the first accurate delineation on a large scale of any portion of the vast chain of the Andes, and enable us to form some idea of the structure of this enormous ridge and of the plateaus and volcanic summits which compose it ; unfortunately the survey does not extend beyond the precise line of the Chilean frontier, and embraces only the western slopes from the water-parting line to the Pacific coast.

A number of papers treating of widely different portions of the globe are published in the last part of Petermann's *Mittheilungen*. Among them are letters by Dr. Bessels describing the wintering (in 1872-3) of a portion of the crew of the "Polaris" Arctic Expedition, at Life-boat Cove, near the entrance to Smith Sound, and a short account of a geological expedition to Spitzbergen by Dr. Richard v. Drasche.—An account is given of a survey that has been made by the engineers Joseph and Franz Keller for a railroad in the very heart of the forest region of South America, and which, it seems probable, will soon be constructed. The want of a high-road of communication with the interior province of Matto Grosso has long been felt in Eastern Brazil, and the plan now proposed is to extend the natural highway afforded by the great Madeira river from the Amazon as far up as the falls of St. Antonio, by making a railway onward from the falls along the left or Brazilian bank of the river ; such a line would also bring the resources of Bolivia into direct communication with Brazil.—A valuable paper by Dr. Behm treats of the newest discoveries and surveys in Eastern Australia, and gives a view of the present distribution of population in this part of the continent, and of the causes which have operated in bringing about a greater density at certain points of the country.—The series of letters describing the geography of the routes of the Russian expedition to Khiva is also continued.—The expedition under Gerhard Rohlfs for the exploration of the Libyan desert is now fully organised, and preparations were being rapidly made for starting during November of the present year ; fifty years have elapsed since any scientific traveller visited this part of Africa, and results of great value to geographical science may be anticipated from the present undertaking.

#### Zoology.

**Veddah Skulls.**—Prof. Macalister describes two very fine Veddah skulls sent to the Museum of Trinity College, Dublin, by Mr. Sharpe. The skulls of this little-known race are remarkable for their small size and lightness, and for their great proportional height ; they are also

exceedingly narrow, long, and oval, dolicho-cephalic, orthognathous, and phaeozygous. Comparing the internal capacity of ten Veddah skulls the average is 66 oz., which contrasts with an average of 88 to 90 oz. for English and Irish skulls. Of the two skulls sent one was of a male and the other a female. This latter was, in addition to the ordinary characteristics, cryptozygous with a trace of the frontal suture and a coronal suture, which was straight above and below, and very completely denticulated for the middle third, its upper surface being convex nearly to ridging. The sagittal suture is coarsely carinated. The occipital crest is well marked, and the under lips of the foramen magnum are unusually prominent. There are two very remarkable lingulae on the exoccipital bone which project outwards and backwards. A table of comparative measurements is given of the above skulls, and of eleven in Dr. Bernard Davis' collection. This paper may easily be overlooked by some to whom it will be of great interest, as it is published in the *Journal of the Royal Geological Society of Ireland*, vol. 3, p. 96.

**The Lancelet.**—The University of Dorpat recently commissioned Dr. Ludwig Stieda to proceed to Naples for the purpose of studying the structure of the Cephalopods. While there Dr. Stieda formed a collection of this most interesting vertebrate ; some specimens he preserved in spirit, others in chromic acid, and he examined them at leisure, as the opportunity did not present itself for the investigation of their anatomical characters at the time. Known now for nearly a century, this simply organised fish and lowest form of vertebrate has been often studied, Rathke, Johannes Müller, Goodsir, Kölliker, Max Schultze, Leuckart Kowalevsky, and many others having written important memoirs on its anatomy and development. It has been found in suitable localities all over the world—that is to say if one may assume that there is but a single species, as seems more than probable. It was first found on the Cornish Coast by Pallas, and since near the Isle of Man (Forbes), on the West of Ireland (Wright), Gothenburg (Retzius), Naples (Costa), Algiers (Wilde), Brazil (J. Müller), Peru (Harting), Borneo (Gervais), East Coast of Africa (Wright), Chinese Seas (Richardson). Though so much had already been written about the Lancelet there was yet room for the excellent memoir of Stieda. Referring fully to the labours of others, he corrects, amends, or adds to them. By a series of thin sections made of specimens from spirit and chromic acid, he has been enabled to examine very carefully the structure of the *Chorda dorsalis*, which seems to be made up of a number of very elongated fibrous cells which run obliquely through the Chorda and partly mingle with one another in the transverse direction and partly in the longitudinal extension of the Chorda. All the different systems are treated in detail. The male and female Lancelet cannot be externally distinguished from each other, but a microscopical examination settles the question at once, and Owen's suggestion that the *Amphioxus* may prove to be the larvae of some larger unknown fish is rendered improbable. Four excellent plates illustrate the memoir, which is printed in the *Mém. de l'Acad. Imp. de St. de St. Pétersbourg*, Tome xix., 1873, No. 7.

**Orab Parasites.**—While a student in the laboratory for experimental zoology, established at Roscoff under the direction of M. de Lacaze-Duthiers, M. A. Giard devoted himself to investigating the anatomy and development of those curious parasites belonging to the genera *Sacculina*, *Peltogaster*, &c. These Rhizocephala are undoubtedly Cirripedia degraded by parasitism. The investigations of Lilljeborg and Fritz Müller settled this point. Although some biologists still appear to trace an affinity between this group and the parasitic crustacea belonging to the family *Bopyridae*, their embryology shows no real affinity. Several species of these parasites occurred commonly at Roscoff : at least two-thirds of all the specimens of *Carcinus maenas* collected were infested with *Sacculina carcini* ; *Peltogaster paguri* was a good deal less abundant, and *P. albidus* was also found. It is to be hoped that the investigations of M. Giard will be published in extenso, with a résumé of all that is now known respecting this section of the Cirripeds. (*Compt. rend.* 27th October, 1873, pp. 945, 948.)

**New Mushroom-Mite.**—M. Mégnin describes a new species of the genus *Tyroglyphus* which has been discovered in vast numbers in the substance of the common mushroom ; from the peculiar form of its mandibles it has been named *T. rostro-serratus*. Minute details of both sexes of this species will be found in this memoir, in which the author claims to have proved that the *Hypopus feroniarum* of Dufour is nothing but a stage of the *Tyroglyphus* ; that certain adventive nymphae, moreover, of the *Tyroglyphus* are transformed into *Hypopi*, and reciprocally that the *Hypopi* can change themselves into the nymphae of *Tyroglyphi*, and he suggests that these *Hypopi* play as regards the *Tyroglyphi* the same rôle that the kystes de conservation of M. Gerbe do towards the *Kolpodi*. These *Hypopi* seem charged as Heteromorphs with the conservation and dissemination of the species. This suggests the interesting question : Have all the mites adventive-heteromorphic nymphae or *Hypopi* in addition to their ordinary nymphae ? This problem the author hopes to be able to solve. Among the eleven species of *Hypopus*, described by Dufour, he recognises six which he does not doubt are related to different mites. An extended memoir on this subject is promised. (*Journ. de l'Anat. et de la Physiol.* Tom. ix., August, 1873, p. 369.)

**Cetacean Parasites.**—Mr. W. H. Dall, of the U.S. Coast Survey, describes a number of new species of whale parasites. Of these belonging to the genus *Cyamus*, he records *Cy. Scammoni*, found on the Californian gray whale, *Rhacchianectes glaucus* Cope; *Cy. suffusus*, on the "humpback" whale *Megaptera versabilis* Cope, and *Cy. mysticeti*, on the "bowhead" whale; this latter is probably the *Balaena mysticetus* Linn. No Pycnogonoids were found, nor have any been reported from the Cetacea of the Californian coast. Of Cirripedia, both *Coronula balaenaris* and *C. diadema* were met with, and a remarkable new genus and species *Cryptolepas racchianecti* is described; this species is found sessile on *R. glaucus*. They were first observed on specimens of that species hauled up on the beach at Monterey; the superior surface of the lateral laminae being covered by the black skin of the whale were not visible at first; when the animal was removed from its native element it protruded its bright yellow hood in every direction to a surprising distance, presenting a very singular appearance. A new species of *Otion*, *O. Stimpsoni*, is described as occurring attached to the *Coronulae* infesting the humpback. The author states that Capt. Scammon is about to publish a monograph of the Cetaceans of the N.W. Coast of America. (*Proc. Californian Acad. Sciences*, vol. iv., pp. 281 and 299.)

### Physiology.

**The Number of Red Globules in the Blood.**—A treatise by M. Malassez, of which we gave a preliminary notice in our February number, has just appeared. The orthography of M. Malassez' and M. Potain's name is here given correctly, with some additional particulars. The author gives the results of some researches he has made with a modification of the apparatus suggested by M. Potain. In his method a thermometer tube is employed which is accurately divided at one end into millimeters; near the other extremity there is a small dilatation having one hundred times the capacity of the graduated part. The latter part is filled with blood, and the tube is then immersed in serum, which is sucked up into the dilatation, carrying of course the blood before it. The blood is thus diluted one hundred times. The mixture is again blown out of the bulb, and the number of globules in the graduated portion of the tube carefully determined by actual counting under the microscope. An easy calculation will now give the number of corpuscles in a given quantity of the blood under examination. The author describes various points that have to be attended to both in the construction of the tube and in the method of counting. In the dog, M. Malassez finds that the blood of the carotid contains 3,410,000 corpuscles in one cubic millimeter, the blood of an artery distributed to the digastric muscle 3,780,000 corpuscles. In a rabbit, arterial blood contained five million corpuscles in the cubic millimeter, and venous blood five million eight hundred thousand corpuscles. The number of red corpuscles therefore differs considerably in different portions of the circulatory apparatus. The diminution observed in some parts may be due, on the one hand, to a destruction of the globules, as in the liver (real diminution), or to the absorption of the fluid parts of the blood, as in the intestine during digestion, thus producing an apparent diminution. When an increase in the number of corpuscles is observed it may be due either to the formation of globules, as in the spleen, causing a real augmentation, or to the exosmosis of a certain quantity of the fluid parts of the blood, as in the salivary glands and the kidneys, where the augmentation is only apparent. A result of this is that the variation in the number of globules is much greater in different portions of the venous system than in the several parts of the arterial system.

**Physiology of the Peristaltic Movements of the Intestines.**—An interesting and original paper on this somewhat neglected subject has recently been published in the *Centralblatt für die medicinische Wissenschaften* by Dr. Alexis Horvath, of Kieff. Horvath points out the numerous difficulties attending an investigation of the intestinal movements, and shows that the temperature of the air to which when the abdomen is opened the intestines are exposed influences in a remarkable degree the activity of the movements that can be induced in them by nervous excitation. When the temperature of the intestines is reduced below 66° F. they exhibit no movements. This observation explains in some measure the extremely discrepant statements made by different physiologists of high standing, and will render a repetition of their experiments necessary.

**Absorption of Fat.**—L. v. Thanhofer describes (*Pester Med. Chir. Presse*, 1873, No. 22) the epithelial cells of the intestine of the frog as exhibiting fine pseudopodia or ciliform processes, which are alternately thrust out and withdrawn and take up on their return the fatty particles contained in the food. The movement of the processes could only be observed in those frogs that had their spinal cord or medulla oblongata stuck through by a knife, and even under these conditions it was noticed in only half the cases examined. The peculiar appearance of rods exhibited by this epithelium, and described by Funke, Brettauer, and Steinach and others is due to these processes being seen when in the retracted state. V. Thanhofer has seen similar processes, but never in movement, in the intestinal epithelium of mammals.

The band to which the processes are attached is annular and forms the edge of the cell-membrane.

**Retrogressive Metamorphosis of Albumen in the Body.**—Prof. Hoppe-Seyler discusses in *Pflüger's Archiv*, 1873, Band vi., p. 399, the question, In what part of the body does the disintegration of albumen take place? He has arrived at the conclusion that neither the blood nor the lymph contains any ferment, and that neither do they possess the oxidizing power which can justify us in assuming albuminous compounds can undergo disintegration whilst still contained in them. There are good chemical grounds, on the other hand, for believing that such decomposition takes place in the albuminous compounds forming part of gland-substance and muscle. Hence he considers the doctrine of the formation of urea in the blood or the *luxus consumption* of Voit to be untenable.

**The Numerical Proportion of Nerve Fibres to Muscular Fibres.**—P. Tergast has carefully studied (*Max Schultze's Archiv für micr. Anat.* ix. 36) the relation of the number of primitive nerve fibres to the number of primitive muscular fasciculi in the muscles of the eye in sheep. In these muscles, as in the sartorius of the frog, examined by Kühne, the muscular fibres extend the whole length of the muscle, and Tergast therefore proceeded to count the number of fibres which are seen in a cross section. The number of primitive nerve fibres was estimated in the same way. For each primitive nerve fibre in the musculus obliquus inferior there are three or four muscular fibres; in the m. obliquus superior six or seven; in the m. rectus inferior seven or eight; in the m. rectus internus eight; and for the m. rectus externus ten muscular fibres. Hence it appears that in the sheep there are on the average about six or seven primitive muscular fasciculi to each nerve fibre. In the human eye there appear to be three primitive nerve fibres to every seven muscular fibres. Such muscles as do not admit of being so exactly estimated as those of the eye receive relatively a very much smaller number of primitive nerve fibres. In the biceps of a young dog, for instance, M. Tergast finds only one primitive nerve fibre to 83 muscular fibres; the musculus sartorius of the young dog has one nerve fibre to from 40 to 60 muscular fibres. In the cutaneous pectoral of the frog there is one nerve fibre to from 23 to 27 muscular fibres (Reichert). In the abductor digiti quinti pedis the proportion is 1 to 40; in the sartorius 1 to 16½. In the ocular muscles of the frog the proportion on the average amounts to 1 to 10. In the caudal muscles of the mouse there are from 28 to 29 muscular fibres to each nerve fibre.

## Philology.

Études de Grammaire Comparée: l'S causatif et le thème N dans les Langues de Sem et de Cham. Par L'Abbé Victor Annessi. Maisonneuve.

THE work before us, short as it is, is a most valuable contribution to Semitic Philology. I cannot, indeed, agree with the two primary articles of M. Annessi's creed—the biliteralism of Semitic roots, and the common origin of Aryan and Semitic; but these do not affect his facts or his method. He has followed the right course in his investigations by calling in the aid of old Egyptian and the sub-Semitic dialects of Africa. In no other way are we likely,

to resolve the many grammatical riddles of a group of languages, too closely related for wide-reaching comparisons and, unlike the Neo-Latin dialects, without any known mother-tongue.

Both the causative *S* and the theme *N* formed part of the verbal machinery of old Egyptian, though used also in that language as independent substantive verbs. They are still found as preformatives in many Coptic words, just as in the numerous secondary Shaphel and Niphal roots in the Semitic languages of which M. Annessi gives examples. A large number of the radicals which are grouped under the letters *y* and *w* in a Semitic dictionary are really derivative formations of this kind; whether this proves the biliteralism of the Semitic parent-language, as M. Annessi believes, is a different matter. כן and נן or קר and קר, are as far from being biliteral as פס and פס; and as I have shown elsewhere, it is very possible that these very roots are merely loan-words. However that may be, the way in which M. Annessi traces the development of the grammatical uses of the two themes out of their original substantive notion is very striking. On the basis of M. Maspero's able researches, he finds the old substantive verb *an* in the first syllable of the Egyptian and Semitic first and second personal pronouns, and then follows it through all its transformations into demonstrative, relative, interrogative, negative, and finally, passive characteristic. In the course of his inquiries he throws out a good many interesting remarks; not the least so being his reference of the third personal pronoun (הוא) to the substantive verb which is so common in Hebrew.

Here and there, of course, his statements may be questioned. I should doubt the connection of the nasal negative with the theme *N* which the author is discussing, since the several Semitic dialects keep it carefully distinct from the latter in form. Then, again, I cannot agree with the explanation which Annessi (following Maspero) gives of the second element in the first personal pronoun, but must still adhere to the views expressed in my "Assyrian Grammar." For reasons given in the same work, again, words like *אני*, *אני*, would have nothing to do with the theme *N*, but would be old plurals, *n* standing for a more primitive *m*. Nor would most philologists assent to the view that the demonstrative is derived from the substantive verb. I am no believer in the so-called pronominal roots, but the idea of locality is certainly prior in language to that of simple existence. Moreover, old Egyptian is, on the one side, a highly advanced language, and, on the other, not the parent, but at most the sister of the parent, of the Semitic dialects. Such being the case, we ought to seek for some common material notion which would lie at the bottom of both the demonstrative and the substantive verb.

It is impossible here to touch upon the many interesting questions called up by M. Annessi's *brochure*. He promises us a further work on other substantive themes, like *an* and *an*, and we shall look forward to a continuation of researches, the first instalment of which only makes us desirous of more. Semitic Philology is still a dark field, and there are few better qualified than M. Annessi to labour in it.

A. H. SAYCE.

Bernays on the Politics of Aristotle. [Aristoteles' Politik, Erstes, Zweites, und Drittes Buch: mit erklärenden Zusätzen im Deutsche übertragen von Jacob Bernays.] Berlin, 1872. Hertz. London: Williams & Norgate.

OF the *Politics* of Aristotle Mons. C. Thurot remarks with truth in his *Études sur Aristote*, "Il est peu d'ouvrages d'Aristote qui soient aussi célèbres et aujourd'hui aussi populaires: il en est peu dont le texte, quoique intelligible

dans l'ensemble, nous soit parvenu en aussi mauvais état.\* These words indicate clearly the task which a modern editor of the work has before him. The matter of the treatise is in most cases and taken as a whole intelligible enough, though the form (admirably described by Prof. Bernays on p. 212 of the present work) needs expansion and articulation to bring the full force of the language and treatment before the modern reader. With the text the case is different; the most cursory inspection of the vulgate as it issued from the hands of Bekker will reveal its almost hopeless condition, while an examination of the materials for improvement furnished by existing MSS. yields but little encouragement. All the extant MSS., says Thurot, have a common origin, and even the Γ of Susemihl, the lost source of William of Moerbeka's translation, seems to have belonged to the same family. Here then is a task not unworthy of the boldest scholar: the work cannot be neglected, for besides being the foundation of all political philosophy it is still one of the best works on the subject, and is always popular when political speculation is rife—at the close of the last century it was twice translated into German, it was the constant companion of Dr. Arnold, who is said to have known it by heart, and St. Hilaire published his second edition in 1848 in the midst of his labours as a member of the Provisional Government: and yet the text is in such a condition that one is sometimes almost inclined to trace with Conring the "*blattarum ac tinearum epulae*" of Scepis in every chapter and paragraph.

Professor Bernays' fragment (we trust it may not long remain so) does not of course aim so high as a complete edition; but it does much for interpretation and much for criticism, as any work by its learned and accomplished author is sure to do. Taking Themistius for his model, he has produced a paraphrase of Bks. i.-iii. which combines with singular success the accuracy of a scholarly translation and the illustration generally sought in a critical exegesis, without sacrificing that elegance of style with which readers of Prof. Bernays' other works are familiar. It is impossible in a short notice to give extracts; but any one who will be at the pains to compare, with the Greek text before him, the more literal translation of Stahr or the freer paraphrase (miscalled a translation) of St. Hilaire with Prof. Bernays' work will readily discern the superiority of the latter; the only fault in fact to be found with the book is that it is incomplete, and that is a fault which we may be permitted to hope will ere long be remedied. Where so much is valuable it is perhaps ungracious to criticise; but there are one or two passages where we should be disposed to join issue with Prof. Bernays. In i. 13, for instance, the words ἡ διαφέρει τοῦτο πλείστον are rendered "aber hier findet doch ein grosser Unterschied statt"; the passage as it stands is very strange and cannot easily be brought into relation with the context, but we doubt whether ἡ can be literally or freely rendered "aber." Again in ii. 8, Aristotle lays aside the further pursuit of a certain line of inquiry with the words ἄλλων γὰρ ἐστὶ καὶρῶν, which Prof. Bernays renders "denn sie erfordert mehr Zeit als wir jetzt haben"; surely it is here a fitting opportunity and not time which is regarded as wanting. Lastly in the well-known passage concerning the power of the Spartan kings, iii. 14, κτείνειν γὰρ οὐ κύριος, εἰ μὴ ἐν τινι βασιλείᾳ (where the vulgate as it stands is unintelligible), Prof. Bernays strikes out βασιλείᾳ and renders the foregoing words "ausser in gewissen Fällen"; this is surely a somewhat forced construction; we much prefer the suggestion of Mr. Bywater

in the *Journal of Philology*, that the true reading is ἐν τινι βασιλείᾳ for ἐν τινι βασιλείᾳ: this very ingenious conjecture not only rests on sound palaeographical grounds, but completely and satisfactorily clears up the difficulty.

A commentator on the *Politics* must, as we have said, do more than illustrate and explain; he must make the text which he explains: for the vulgate, notwithstanding the efforts of Bekker, presents insuperable difficulties. The edition of Conring published in 1656 represents one extreme view of the condition of the text; it is as full of stars as an astronomical diagram; the opposite view is exhibited by Goettling, who is very sparing in emendation and boasts (perhaps prematurely) that he has banished from his text the stars which even Schneider and Coray had left. Conring no doubt is fanciful, and it may be that his knowledge of Greek is as Schneider says superficial; but his acuteness is indisputable, and his edition raised questions which criticism cannot yet be said to have set at rest. The opinion of Prof. Oncken on this point deserves attention: "Ich denke von der Reinheit des Textes der *Politik* ganz anders als Stahr, Götting, Barthélémy St. Hilaire, und bin Ketzler genug, um sogar die Meinung auszusprechen, dass, wenn auch der viel belächelte 'Asteriskenhimmel' des Hermann Conring nunmehr ganz verschollen ist, an sehr vielen Stellen nur das Zeichen, nicht aber die Lücke oder Unebenheit verschwunden ist."\*

Prof. Bernays' view of the matter may be inferred from the fact that in the three books he has taken in hand he has found it necessary to make more than a hundred variations from the text as Bekker left it, and that at least one passage he surrenders as so far hopeless.† For several of his emendations he is indebted to the labours of his predecessors; but there are many, and those not the least important, which so far as we have been able to discover are entirely due to the ripe scholarship and profound erudition of Prof. Bernays himself. It is impossible at present to examine these in detail, but we think they will generally commend themselves to the judgment of scholars, though in at least two cases to be shortly mentioned Prof. Vahlen has expressed his dissent from them. We could wish Prof. Bernays had done something more for the elucidation of Aristotle's criticism of Plato's βουλὴ in the Laws in *Pol.* ii. 6: the passage as it stands is justly compared by Goettling (*Fend Progr.* 1855) to Goethe's "Hexen-Einmal-Eins;" but we are disposed to think it is capable of satisfactory emendation, and though Prof. Bernays has commenced he has scarcely completed the cure. In ii. 7 we are surprised that Prof. Bernays has not adopted the very elegant and satisfactory emendation of Rassow (whom Boiesen had preceded) of ἀνεν ἐπιθυμιῶν for the ordinary ἀν ἐπιθυμοῖεν instead of omitting the latter words: the reading of Rassow and Boiesen is almost determined by the parallel passage in *Eth. Nic.* vii. 13, with which the vulgates directly at variance. In ii. 8 we are disposed to agree with Prof. Vahlen (*Beitr. zur Arist. Poet.* iii. 314) in questioning the propriety of reading ὀλίγους for ὁμοίους or ὁμοίως; but we cannot think Prof. Vahlen has been equally successful in combating what is perhaps the most elegant and convincing of all Prof. Bernays' emendations: the passage (ii. 5) runs in Bekker's text χρῆ προσέχειν τῷ πολλῇ χρόνῳ καὶ τοῖς πολλοῖς ἔτεσιν, the tautology of which it is

\* *Die Staatslehre des Aristoteles*, p. 66.

† ii. 2, ἐν τοῖς δὲ μμείσθαι τὸ ἐν μέρει τοὺς ἰσους εἰκεν ὁμοῖως τοῖς ἐξ ἀρχῆς. Prof. Bernays says, "für δὲ μμείσθαι eine annehmbare Vermuthung bis jetzt nicht vorliegt." We suggest with much hesitation ἐν τοῖς ἀνομοιοῦσθαι ἐν μέρει τοὺς ἰσους εἰκός ὁμοῖως ὅντας ἐξ ἀρχῆς, comparing what is said about the ποδανιπτήρ of Amasis in i. 12. But such a remedy must be admitted to be desperate, though not more so than Susemihl's.

\* *Etudes sur Aristote*, p. vi. Oncken and Spengel (the latter quoted by Oncken) express themselves to the same effect; see the former's learned and valuable work, *Die Staatslehre des Aristoteles*, p. 66. See also Hildenbrand, *Rechts- und Staatsphilosophie*, i. p. 342 ff.

difficult to defend or deny: Prof. Bernays (*Hermes* v. 301) regards the passage as a quotation from Simonides twice cited by Plutarch, and for ἔτεσιν restores ἔθνεσιν from one of those passages: this seems to us very convincing, but Prof. Vahlen (*Zeitschr. für Ost. Gymn.* xxi. 828) who has used the passage as it stands for the illustration of an Aristotelian fragment found also in Plutarch—ἐκ πολλῶν ἑτῶν καὶ παλαιοῦ χρόνου—defends the vulgar reading and cites a passage from Aeschines—παλαιότητος καὶ πλῆθους ἑτῶν—to illustrate his own view; he adds, what is quite true, that it is not proved but only suggested that the words which justify ἔθνεσιν belong to Simonides and not to Plutarch himself. It is perhaps presumptuous to attempt to decide where two such authorities are at variance; but it seems to us that the conjecture of Prof. Bernays at once explains the text of Plutarch and restores that of Aristotle, while it is scarcely necessary to point out to Prof. Vahlen that παλαιοῦ χρόνου and πολλῶν ἑτῶν are not identical terms, while πολλῶν χρόνον and πολλοὶς ἔτεσιν are.

We cannot conclude without cordially recommending Prof. Bernays' little book to the notice of all students of Aristotle, and repeating the hope that its only fault may be speedily remedied by the completion of the work.

JAMES R. THURSFIELD.

**A History of Roman Literature.** By W. S. Teuffel, Professor at Tübingen. Translated with the author's sanction by Wilhelm Wagner, Ph.D. London: Bell.

ANY one who wished to show why it is that German work is apt to be so much superior to English, could hardly find a better example than the book before us. It embodies the results of a life of research in a succinct, but not abridged, form: it is up to the very latest level of Latin philological knowledge, and it is written in a style never heavy and generally lively and interesting.

The general plan of the work is as follows; it will at once be evident why this, the latest history of Latin literature, is likely to supersede its predecessors, more especially the cumbrous and somewhat pedantic work of Bernhardt.

After a general introduction on the various developments of Latin literature as a whole, and a brief account of the scanty relics of a really ancient time, e.g. the Carmen Saliare, the Carmen Fratrū Arvalium, the laws of the Twelve Tables, the earliest inscriptions, the Fasti, the Annales Pontificum, &c., the actually extant literature is divided into three periods: (1) From Andronicus to Sulla, 514-670 A.U.C.; (2) the Golden Age, 671-770; (3) the Imperial Period, beginning with the principate of Tiberius and reaching to the eighth century of the Christian era. Each of these periods is described generally and then subdivided into epochs. In each epoch poets and prose writers are treated separately: and under the latter head are included the grammarians and jurists (this last a most important section), each handled with as much fulness of detail as the historians, orators, or writers of philosophy.

It is however in the lucid and methodical arrangement of the facts relating to each separate author that the great merit and charm of the work lies. Thus the article *P. Vergilius Maro* contains (1) an account of the sources for the poet's life, (2) a discussion on the orthography of his name, (3) a brief life, (4) his personal appearance, (5) his circumstances: in each case the authorities are quoted *in extenso*. Then follows a description, drawn up similarly in brief sections, of his character as man and poet, his mode of composition, his political relations with the leading men of the time; then a detailed account of the *Eclogues*, *Georgics*, and *Aeneid*, the date of each, their

peculiarities of manner and diction (including what I consider a too disparaging criticism of the strophical composition traceable in some of the *Eclogues*), the principal MSS. and editions; lastly an account of the *Ciris Culex*, *Moretum*, *Catalecta*, and other short poems ascribed to Virgil. Attached are references to the various treatises, dissertations, programmes, &c., which treat of special matters affecting Virgil's life or poetry: a merit for which scholars will feel really grateful to Dr. Teuffel; for it is well known that these short monographs often contain in the compass of a few pages most of the available material still left us on the more out-of-the-way subjects of classical literature.

Another great excellence of Dr. Teuffel's book is the care with which he compares contemporary styles, and traces in them the peculiarities of their epoch, or their deviations from it: a good specimen is his comparison of Gaius, Suetonius, and Fronto, p. 246, vol. ii.; a parallel excellence is the introduction of the principal Greek writers of each period. Those who are interested in the early literature of Christianity will find these writers treated with fulness and impartiality; the author is, as might be expected, aware of their failings and at times severe upon them; indeed it might be wished that he had allowed himself a little more freedom on this head, and that the striking phenomenon of the coincidence in the progress of Christianity with the decline of all literary power had received more copious treatment from a writer at once so able and in such full command of all the resources necessary for forming an adequate judgment. Was it or was it not an accident that the poems of Iuvencus synchronized with the age of Constantine?

There are of course many views in so extensive a work which seem open to criticism. We are not inclined to regard Calvus or Varro Atacinus as the equal of Catullus, though the style of Calvus seems to have been like that of Catullus and the extant fragments of Varro's *Chorographia* are good enough to make us wish we had more. To speak of Euhemerism as a mad and blasphemous system (p. 133) is surely an exaggeration; it was at least a praiseworthy attempt to rationalize mythology and it certainly marks a stage in intellectual progress. Nor can we accept the prevailing view of the present time as to the incapacity of Nonius; a man whose services in preserving so much of the ancient language and literature have attracted a microscopic attention which exaggerates his defects: at any rate it seems questionable whether he can fairly be called a tiro (ii. p. 307). The view that the satire ascribed to Sulpicia is a modern forgery has already been combated by me (*Academy* i. p. 87); and I may say that every fresh perusal has strengthened the conviction of its genuineness there put forward.

Among omissions the most signal is Mayor's *Juvenal*, a work which we feel sure Dr. Teuffel can never have seen; probably owing to the accident of its being out of print. It is much to be hoped that this exhaustive and admirable edition will soon be completed in its new form. Mr. Paley's *Propertius*, though not a work of the same calibre, might also have been mentioned. Mr. Sellar's *Roman Poets of the Republic* is a work which in its most important section, the chapters on Lucretius, deserves Dr. Teuffel's attention, though even in England it cannot be said to be well known. After all, in spite of the labour spent on classical study in this country, we can point to no work of a serious and substantive kind on the literature of Rome; the old associations of philology with *chefs d'œuvre* of Greek and Latin versification, against which Germany has always presented a standing protest, still dominates our great schools, and determines more than anything else the scale of honours in at least one of our universities. How can we look for anything like real progress or real research? for investigation

of sources, study of MSS., all that gives its excellence to German work?

Dr. Wagner's translation, though by no means irreproachable, succeeds in preserving the liveliness of the original: some cases of rather questionable English and a considerable number of misprints, generally it is true of single letters, will no doubt find correction in a new edition. R. ELLIS.

### Contents of the Journals.

**Mnemosyne.** New Series. Vol. i., pt. 4.—The principal articles in the current number are (1) a series of critical observations on Helioidorus by Naber: (2) notes on the text of Plutarch's *Moralia* by Cobet, who naturally finds that Hercher, the most recent editor, has left a good deal for others to do after him: a large proportion of Cobet's proposals are of the most convincing kind: (3) Herodotea and Thucydidea, by Dr. Badham: (4) *Coniectanea Latina* (on passages in Juvenal, Horace, Vergil, and Propertius) by H. van Herwerden—a production which hardly deserves a place in a journal like the *Mnemosyne*, unless it is inserted in order to bring conjectural criticism into discredit. What is one to think of a scholar who, commenting on the words, "ut mendax aretalogus" in Juvenal xv. 16, has the courage to print the astonishing remark, "vide ne hic sit aptius TERATOLOGUS"?

### Notes and Intelligence.

M. Lenormant has published another volume of his admirable *Études Accadiennes*. It contains an Accadian syllabary, with the meanings of the several ideographs, a justification of the name Accadian, and additions and corrections to the grammar of the language from unpublished inscriptions which he has examined in the British Museum since the publication of his two earlier volumes. M. Lenormant claims with good reason that his syllabary is the largest and most complete yet published; and yet so numerous were the characters used that many might still be added to his list. Every student could, of course, discover deficiencies in it, since no single scholar can be expected to know all the phonetic values and significations of the ideographs met with in the inscriptions. Thus the character numbered 54 means "a shadow" (Ass. *tsalutu*), that numbered 73 "rest" or "setting" (Ass. *tarbatsu*), that numbered 112 "a building," and so on. I confess, however, to some surprise at finding the character which is sounded *tir* (No. 354) set down as denoting "tribe," "tongue." It really means "life," as the tablets inform us; and it is clearly connected with *ti* and *tla*. M. Lenormant seems to me to have fully disproved the novel view of M. Oppert that the old Turanian language of Chaldaea was termed Sumerian, and to have shown that it really belonged to the Accadians. His conclusion is that Sumiri is the Shinar of Scripture, and signifies the Semitic population which settled in the northern part of Babylonia and from the time of Sargon of Agane downwards played a leading part in Chaldaean history. M. Oppert has pointed out that the Sumirians are identified with the Assyrians; but the ideographic equivalent of Sumiri, which the latter scholar interprets "holy language," M. Lenormant thinks should rather be rendered "home dialect." A. H. SAYCE.

Dr. Harkavy of St. Petersburg, the author of the Mahometan documents on the Slaves and the Russians (*Skazania musulmanskich pissateley o Slavranach u Ruskich*, St. Petersburg, 1870-71), is now in England entrusted with a mission from his Government in order to copy the Arabic documents relating to the Slavonic Nations. We understand that he was fortunate enough to find many unknown documents on the subject in the MSS. of the British Museum and the Bodleian Library. Dr. Harkavy is also engaged in compiling the catalogue of the important Samaritan collection, bought by the Russian Government from M. Firkovicz, the celebrated owner of the Karaite MSS. now in the Imperial Library of St. Petersburg. For this purpose Dr. Harkavy has examined the Samaritan MSS. of the libraries of Berlin, Paris, the British Museum, and the Bodleian Library.

A neat reprint of Voltaire's *Anciens Proverbes Basques et Gascons*, with both the original and modern Basque orthography, and parallel proverbs in other languages, has just been published by Cazals, Bayonne. An appendix gives a version of the well-known passage in Rabelais into modern Basque, by M. Archu, and some rather miscellaneous remarks on Basque bibliography. 100 copies only are on sale.

## TO THE READER.

WITH the fifth volume the *Academy* enters at the beginning of next year upon a new phase of its existence. Instead of 480 pages of text a year, it will now publish, in fifty-two weekly numbers, 1040 pages, each of which will contain one-fourth more matter than the old *Academy* page.

Three-fourths of each number of the new *Academy* will be devoted to Literature of the imagination, Travels and Antiquities, History and Biography, and will include regular notices of the Picture Exhibitions, the Music of the Season, and the current Drama, English and French. There will be periodical news-letters on literary, artistic and scientific subjects from the chief capitals of Europe, and from America, and an adequate space will be set apart for correspondence between literary men, jottings of interest, publishers' announcements, personal news, and the like. In all these matters the *Academy* will tell people of all classes who are aiming at the higher culture, what to choose and what to discard, in unmistakable terms and with promptitude.

The remaining fourth part of the periodical will be occupied with scientific matters interesting to a smaller class of readers, but divested as far as possible of all unnecessary technicalities which render them uninteresting or unintelligible to the educated as distinguished from the scientific reader. The various departments of knowledge have now become so minutely specialized that even the scientific man can no longer hope to keep pace with discovery in all directions at once, and beyond the limits of his own peculiar study occupies to a greater or less extent the position of the educated layman or general reader. So that the wants of the small scientific class are in this respect identical, or nearly so, with those of the larger reading public. These requirements vary in different countries and at different periods, and can only be ascertained by actual experience. Our experience during the past four years has been that the scientific matter to be found in the *Academy* has been pitched in too high a key, or at least been presented in too technical a form, to be so practically useful even to the scientific reader in this country and at the present time as it might without any diminution of fulness or accuracy be made. We propose then to ourselves a much more difficult task than we have hitherto attempted, viz. that of making this department

of the *Academy* useful to all, and engaging the attention and interest of all educated persons in the progress of European knowledge.

This department will embrace Natural Philosophy, Theology, and the Science of Language, especially the English Language and Dialects, and the very important and interesting study of Comparative Philology, in connection with the Mythology, Folklore, Manners, Customs, and Institutions of the various races of mankind.

It may be asked, why retain the name *Academy* if the paper is to be so entirely reorganized as to form to all intents and purposes a new critical organ?

We have reorganized the paper because we think that such a critical organ as we have described is wanted. As to the retention of the name, a few words of explanation are necessary.

Very few persons have, we think, understood what was meant by calling the old fortnightly periodical, which we now propose to supersede, the *Academy*.

The word "*Academy*" suggests to most average Englishmen, in the first instance, the idea of a second-rate and pretentious private school. It is also the name of a chartered Institution in London, which has won a reputation for fairness and discrimination in hanging pictures. As the name of this periodical, it appears to have given the impression to some persons that we propose to ourselves to treat of matters exclusively interesting to schoolmasters and professors at the Universities. But in all European languages except the English an "*Academy*" means a *central organ of sound information and correct taste in intellectual matters*. The great French Academy founded by Richelieu has more particularly taken under its charge the maintenance of the purity of the French language. The Academies founded in the principal German Capitals, and elsewhere, in imitation of the French, have laid a greater stress upon the maintenance of correct information in matters of scientific knowledge; and the renowned Academy in France has added to itself special Academies having the same object.

Now it is in the sense in which the word is understood on the Continent, in the sense of a standard of correctness in intellectual matters, that the name was and is still applied to the *Academy Journal*. The great national importance of concentrating the intellectual forces of a country is recognized

everywhere except in England; and this recognition has justified the employment of public funds for the maintenance of the Foreign Academies as public Institutions, and the partial support of their members. And the absence of such an institution in England has had this result, that a larger amount of bad work both in literature and in science passes unchallenged in this country than in any other, standing upon the same level of civilization.

What, then, in other countries is done for learning and science *by means of an Institution* supported at the public expense, we propose to accomplish in this country, not only for these but for all the materials of culture and refinement *by means of a periodical* subjected, after the English manner, to the economic conditions of supply and demand, viz. to keep the reader up to the mark of what is best in the world, to gibbet mercilessly what is bad, and to criticize with sympathetic fairness what falls between these two extremes.

Keeping thus always to the main stream of the best production, we shall have to point to Germany for Science, to France for Art, but to our own country for Poetry and Fiction, for the Literature of Manners and Society, for Travel and Adventure, as well as for those great philosophic ideas which are transforming the mental horizon of mankind.

But there is, we are firmly convinced, no necessary connection between setting up a standard of correctness, and being unintelligible or unattractive to the average reader. It is true that much of the attractive writing in this country is deficient in accuracy, and perhaps no less true, that our own work hitherto has preferred accuracy to attractiveness. Still we believe that it is practicable to unite both these qualities in criticism; and by our elaborate organization of departmental editing, we confidently expect that we shall be able, as we have determined, to unite them in our new issue.

EDITOR.

## General Literature.

*Memoirs of Sara Coleridge.* Edited by her Daughter. King & Co.

MANKIND always have a strong curiosity about the affairs of their neighbours, and a person who for any reason is well known is a neighbour. We are inclined to think that this is the principal reason of the popularity of these interesting memoirs, which have already reached a third edition. Mrs. Coleridge was much more than a representative of the best type of lady-like accomplishment (in the high sense of the word) which prevailed during the first half of this century; if she had been nothing more she would have been forgotten like many others who wrote letters quite as elaborate, and quite as high toned, and very likely as ingenious, to less distinguished correspondents. And yet, although it is the individual distinction of Mrs. Coleridge which attracts the attention of the reader, it is rather what is typical that retains and satisfies it: the combination of refinement, both moral and intellectual, with keen domestic affection and much spiritual earnestness is really what repays him more than any peculiarity of view in the writer, though the letters certainly add to our knowledge of the Coleridgean tradition.

Mrs. Coleridge came at just the fortunate time—when women of the middle class were turning to intellectual cultivation as an outlet from the routine of housekeeping and visiting; before the days of Mudie, when the abundance of books and the increase of leisure have combined to stimulate so many girls into a condition of listless restlessness, because they are under the impression that they have got to find a use for the education which they have received or are trying to give themselves, and cannot be easy until they

have a career. It was career enough for Mrs. Coleridge to be a daughter, a wife, and a mother, although marriage was already becoming difficult, and she had to wait seven years before her cousin was in a position to marry her. Her most important literary labours were devoted to gathering up the fragments of her father's mind; her most successful work was the cheerful verses she composed for her son under the title of "Pretty Lessons," and her only original production, *Phantasmion*, is really in substance a glorification of the Lake Country, for which her affection was even stronger than her admiration. Indeed her intellect was so completely the servant of her affections, especially her family affections, that one fancies that she might have lived contented, though inglorious, even if she had not been the wife of one Coleridge and the daughter of another and a greater, for certainly she was much more free from personal ambition than most writers with a tithe of her talent and attainments.

Perhaps some readers will be left under the impression that this supremacy of the affections was more favourable to the development of her character than to the play of her intellect. Here, for instance, is a passage of a kind of which we should have been glad to meet more:—

"The substance of what pleases you in Abercrombie, I have lately read in Chalmers's Bridgewater Treatise; and, oh! when the wordy Doctor does get hold of an argument, what a splutter does he make with it for dozens of pages. He is like a child with a new wax doll; he hugs it, kisses it, holds it up to be admired, makes its eyes open and shut, puts it on a pink gown, puts it on a blue gown, ties it on a yellow sash, then pretends to take it to task, chatters at it, shakes it, and whips it; tells it not to be so proud of its fine false ringlets which can all be cut off in a minute, then takes it into favour again; and at last, to the relief of all the company, puts it to bed."

After this the writer goes on to hope that her correspondent may have time to learn Greek, "because that language is an *idea*. Even a little of it is like manure to the soil of the mind, and makes it bear finer flowers." The latter reflection is stimulating and perhaps instructive, the former is only amusing; and though Mrs. Coleridge felt it her duty to her children to cultivate her powers of enjoyment in the early days of her widowhood in order that she might be able to live, she never seems to have been led to cultivate her powers of giving amusement as she might have done if she had taken the advice given her to "turn her mind out to grass." In fact her natural seriousness was deepened by her being brought up with Wordsworth and Southey, and by being left in charge of her father's memory, first with her husband and then alone, till she became an ardent and convinced though independent disciple. Perhaps this in itself was an intellectual misfortune; it led her not to exaggerate but to misconceive her father's philosophical importance. He opened two new lines of speculation both fruitful though divergent, and he spent himself in waiting at the point of parting and beckoning passers by to look down the magnificent vistas; if he had had energy to follow either he would have found that it was impossible to follow both. Probably during his lifetime this stationariness did not detract from the efficacy of his influence, but it was different when his daughter tried to recall another generation to the starting point as if it were a resting place. And this attempt to give a factitious finality to the system which Coleridge never expounded in its completeness, and probably never elaborated, did not preserve the author from an inconsistency which becomes more and more apparent in the later letters. The whole criticism of Tractarianism proceeds upon the assumption that the mind's ordinary way of thinking upon high subjects is applicable to the highest, and this is even reinforced by the assertion that *a priori* intuitions, such as the impossibility of the existence of evil spirits, are to override all external authority, since the authority itself only rests upon the intuitions it satisfies. So

far so well; but if the ordinary way of thinking is to be paramount, why is the ordinary way of wishing to be so completely overruled? and yet this is assumed in all the criticism of rationalism and worldliness and poor Keats' neopaganism. The fact is that the same course of conduct which destroyed Coleridge's naturally weak will fostered a temper which made it seem natural to sacrifice wishes, and this was strengthened by the habit of self-reproach: and his daughter, who had little or nothing to reproach herself with, accepted the inheritance of her father's penitence.

Her criticism of Keats is not the only instance of one-sidedness. She was certainly a good deal less than just to Mrs. Hemans, while she was a good deal more than just to Joanna Baillie; a really trained critical perception would have discerned the hollowness of the pretensions of a poetess who judged so ill of poetry, and a perfectly liberal criticism would have recognised Mrs. Hemans' real grace and delicacy of feeling in spite of the absence of original thought: Mrs. Coleridge preferred to say that Mrs. Baillie was a poem in herself, and that Mrs. Hemans' manufacture could be distinguished from that of other writers as a room furnished by Jackson might be distinguished from a room furnished by Gillow.

*En revanche* she characterises with a great deal of force and truth, though perhaps with hardly enough severity, the contrast between Wordsworth's earlier and his later manner, and perhaps she is the only writer who has resisted the temptation to overpraise "Laodamia": the criticism, which is too long to extract, is certainly keen and subtle, though confused by over-eagerness; but one feels Mrs. Coleridge is not quite without ground for saying: "In this poem Mr. Wordsworth wilfully divested himself of every tender and delicate feeling in the contemplation of the Wife and the Woman, for the sake of a few grand declamatory stanzas, which he knew not how else to make occasion for."

The correspondence with Aubrey de Vere, from which the above is taken, may strike some readers as rather depressing on the whole: the writer seems stationary while the world is moving, she seems attached to her opinions out of proportion to their importance. She insists and explains, and she does not convince, and one wishes she could have agreed to differ at first instead of at last: and though her theological acquirements were more than respectable, she lays down the law on such points as St. Augustin's view of baptismal regeneration and Eutychianism in a way that shows a total failure to apprehend the historical context of the books she read: consequently she was as completely as Dean Stanley at the mercy of the fallacy that every opinion is orthodox till it is condemned by an ecumenical council.

It is a curious question whether her intelligence and laboriousness could have been directed so as to produce more result for others: for herself it produced the high-strained consciousness of a well spent life, which posterity has been content to admire without asking the Preacher's question which Mrs. Coleridge never asked of herself, "Why was I then more wise?"

G. A. SIMCOX.

Oesterley's *Gesta Romanorum* and *Johannis de Alta Silva Dolopathos*. [*Gesta Romanorum*. Hrsg. von Hermann Oesterley. Berlin: Weidmann. *Johannis de Alta Silva Dolopathos, sive de Rege et Septem Sapientibus*. Hrsg. von Hermann Oesterley. Strassburg: Trübner.]

It is well known that there are few works which occupy a more important place in the history of the fiction of the Middle Ages, and even of later times, than the former and part of the latter named collection, forming the subject of this notice. Their most recent editor, Dr. Oesterley, formerly *custos* of the Library at Göttingen, and now of that at Breslau, is already well known to the learned world

by several excellent works, and especially to Englishmen by his edition, accompanied by valuable notes, of *Shakspeare's Fest Book* (London, 1866); and he has now given a new proof of his learning and untiring research. With regard to the *Gesta Romanorum*, they have long been the subject of investigation, and yet the very complicated questions as to their origin, home, age, and author or compiler, had not been satisfactorily solved, and indeed still remained surrounded by impenetrable obscurity. No one in fact had adopted the only right method of solution, namely, a close comparison of all attainable manuscripts with each other; and only one *savant*, Sir Frederick Madden, had undertaken a part of this task, and given a general description of the manuscripts to be found in England. Even he defends the supposed existence of a peculiar Anglo-Latin text (in contradistinction to a continental one), but he declares emphatically that a final decision on the above-named questions is only attainable by the way I have mentioned. The uncommon difficulties with which this task is surrounded are very obvious, and Oesterley, for attempting to deal with them, is entitled to all acknowledgment. All the more must we regret that, in spite of his *improbis labor*, he has not succeeded in dispersing the darkness which hangs over the author as well as the antiquity and home of this collection, though he has shown that in its original form it probably came into existence about the end of the thirteenth or at latest the beginning of the fourteenth century, and according to all appearance first in England. He relies for proof of this especially on the names of dogs occurring in the Vulgar text (p. 142), *de diaboli laqueis quibus nos multipliciter circumvenire satagit*, which are all recognisable as English, and some of which have remained in use till recent times. Only he has failed to explain the name *Emulemin*, though according to his opinion this also would seem to be of English origin. Oesterley is plainly in the right, I think, for the manuscripts give the name in the form of *Ewylemin*, and this is nothing else than *Away, leman*, like another of these dog-names, *Beamis* (old French=*beau amis*), which answers to *leman*, and is not derived, as Oesterley supposes, from *Böhmen* (Bohemia). Further on, Oesterley shows that the whole collection was originally taken from a selection of tales from Roman history, or rather from Roman historians; that they had been long gathered together for use in sermons or moral disquisitions, and sooner or later became known by the designation of *Historia*, or *Gesta Romanorum moralizata*, or some similar title. Whether this first version of the work consisted exclusively of such extracts from classical writers, or whether these extracts were originally united with a series of later tales and parables (*quædam alia*), cannot now be ascertained. This much is certain, that from a very early period collections of extracts from the later Roman writers were known and designated as *Gesta Romana* or *Romanorum*, and that the work before us took its rise from the adaptation of such a collection to moralising purposes; and to this moral part of the work belongs its special character and individuality. How from such a groundwork has arisen the endless variety of manuscripts of the fourteenth and fifteenth centuries, these manuscripts themselves are the best sources of information. First, parables, easily admitting of a spiritual interpretation, were inserted or subjoined; then, according to circumstances or inclination, extracts that had been modified and made fit for *moralisation* were added, and at last tales were selected, often ignorantly enough; solely for the sake of their spiritual meaning. Oesterley points out what works were used in preference for the enlargement of the original collection; but among these the *Moralities* of the Dominican Professor Holcott, who died in Oxford in 1349, ought scarcely to be counted, for the pieces hitherto regarded as possessing the

characteristics of his style are found to exist in a manuscript of the *Gesta Romanorum* of 1342, here indicated for the first time. On this as well as other grounds it is clear that the supposition of an independent Anglo-Latin text is untenable, and that the English version can only be counted as one of the branches of a widely spread family of manuscripts.

Beside the results of Oesterley's researches which I have here briefly indicated, his work contains a very complete account of almost all the manuscripts, the greater number of which, amounting to about 160, have been examined by himself; then the text of the three first Latin editions which appeared between the years 1472 and 1475, and contain 150 (151) chapters; along with the chapters 152 to 181, which were added in the third impression; beside these, the chapters belonging only to the German translation (Augsburg, 1489) are given in an appendix in the original Latin; and lastly all the pieces of the Latin manuscripts not hitherto known in their original language. The book concludes with very full and valuable information on the sources and the literary diffusion of all the stories contained in the *Gesta*, and a very welcome index, so that in point of completeness the work leaves nothing to be desired, while it has cleared away nearly all the obstacles in the way of further researches.

We now come to the second work standing at the head of our notice, the *Dolopathos*, which is a peculiar development of the widely known *Seven Wise Masters*. Till recently the work was only known in the French translation, of which a *trouvère* called Herbers was the author, between the years 1223 and 1226, who ascribes the Latin original to a monk of the Cistercian Abbey of Haute Seille, in the diocese of Toul, named Dam Jehan. So long as this original was not to be found, it remained uncertain whether the translator had been faithful to it, or whether he had permitted himself any alterations, and if so to what extent. These questions had been long agitated, but without any result, till in the years 1864 and 1867 Professor Adolph Mussafia, the eminent Romance scholar of Vienna, discovered three manuscripts which contained the history of *Dolopathos* in Latin prose. He published his discovery, with a very learned introduction, in the *Memoirs of the Vienna Academy*. As, in spite of all their agreement with the French *Dolopathos*, the three Latin manuscripts and a fourth afterwards discovered by Oesterley still varied from it in many important particulars, it was still possible that they might not contain the original work of Dam Jehan, but only a modification of it or a prose adaptation of the French poem, especially as they all belonged to the fifteenth century. However, at Oesterley's instigation, Dr. Schrötter, Librarian of the Luxemburg Athenaeum, has made a successful search, and discovered a manuscript of the thirteenth century, containing the Latin *Dolopathos*, and agreeing with the old French poem in every particular, so that we at last possess the original. Of this original, which he attributes to the year 1184 or 1185, Oesterley gives the *editio princeps*, accompanied by a careful introduction respecting the history and subject-matter of the work.

It is particularly to be noticed that, according to Dam Jehan's own declaration, he got his subjects from the mouth of the people, and that what he thus received he has set down faithfully in his work, from which it follows that all the tales were current orally, at least among the people in France, by the second half of the twelfth century, and consequently must have found entrance far earlier; so that the idea of literary sources for the monk of Alta Silva cannot be entertained, not even for the framework of the story, as with regard to a western version of this, in the twelfth century, we have as yet no information.

Of the eight remaining tales, three only resemble others in

the *Seven Wise Masters*; without being taken however from that collection, but rather, as has been said, derived from the people, like the other five.

There is little trace of the direct influence of the Latin *Dolopathos* upon the development of the kindred branches of literature; but according to Oesterley, the indirect influence of Herbers' French translation is more important, as much of the subject-matter, which had been originally derived from the people, was through it brought back to the people's knowledge in ever widening circles. The means by which this general diffusion was effected were the poems of the French *trouvères* which made their way through England, Italy, Germany, the Netherlands, Hungary, Russia, and even into the Asiatic steppes. Our acquaintance with popular poems, legends, and tales has lately been greatly increased, and some of these, from nations both near and remote, bear so striking a resemblance, either in whole or in part, to numerous isolated but most characteristic features in the tales of *Dolopathos*, that we cannot doubt that this work had some influence on their origin or development.

This fact affords a new proof that the great stream of living popular fiction which poured from East to West, was followed by a less powerful counter-tide which has carried these traditions back again far into Asia. The *Dolopathos*, as Oesterley remarks, will always be one of the most important and instructive memorials of this fact. I cannot deny, however, that this supposition of a returning tide of tradition, and especially one reaching far into Asia, must be treated in each particular case with the greatest caution, though its general existence may be admitted. In any case, the importance of the *Dolopathos* in reference to literature is very great, and Oesterley in making known the original has rendered great service to learning. As regards the literary references and parallels of the several tales, they have been given before, partly by others, partly by Oesterley himself in various places (such as the *Gesta Romanorum*), and he has contented himself in general with referring to these, though he has added many supplementary notes.

FELIX LIEBRECHT.

Outlines of German Literature. By Joseph Gostwick and Robert Harrison. Williams and Norgate.

It is more than forty years since Mr. Taylor, of Norwich, published the concluding volume of his *Historic Survey of German Poetry*, and during that time perhaps no one year has gone by, during which somebody has not endeavoured to enlighten us by telling what he thought about the German language and the books written therein. The works of these writers, however, turn out on examination to be for the most part mere trade speculations, unworthy of regard except so far as they may be useful to examiners or the poor youths about to undergo the tortures such persons are retained to inflict. The *Outlines* before us is not a work of this class, but really what it professes to be, an account of a great literature written by those who are familiar not with the language only, but with the thoughts of many of the men who have made the knowledge of what our forefathers called the "High Dotche" tongue a matter of necessity for all persons who desire culture.

It is surprising that a really good book of this kind has not been published years ago. It is to be accounted for, we think, by the fact that among the thousands of our countrymen and countrywomen who profess to know something of German, the greater part have learnt it merely as a frivolous accomplishment, and a large section of the rest only care for it so far as it helps them to understand more fully the one or two subsections of knowledge in which they take

a living interest. A taste for literature as distinct from a fondness for reading novels, in prose or verse, is a rare endowment, and the literature of another people, however close the kinship may be, presents many difficulties even to those who have thoroughly mastered the grammar and vocabulary. There is but one serious fault to find with the book before us. It is so well done throughout that we cannot but be angry with its authors that there is not more of it. The condensation has been far too rigorous. It is impossible to survey German literature from Ulphilas to Dr. Döllinger within the compass of 581 small octavo pages, and we do not think it was wise that such an attempt should be made by authors who if they had given themselves room enough would have been able to do the work in a manner so eminently satisfactory. The ground-plan is however mapped out, and, except in certain minute particulars, little is required beyond enlargement.

By far the best parts of the book in our opinion are chapters ii.-vii., which treat of the literature of the Middle Ages. Here much of the information given is new in an English dress, and if we mistake not, even well-instructed Germans who have not made the literary history of their country an especial object of study will find many things interesting to them. There is a strange contrast between the mediæval popular literature of Germany and that of England. Here, though nobles and gentlemen were subjects of satire, the virtues of high birth and the rank commonly attendant thereon were always recognized. Nor until the democratic movement of the last century had been long prevalent in drawing-rooms, did the people consent to hear patiently stories in which such things were set at naught; and even now, if we may judge by the tales that are most read in the farm-house kitchen and by the peasant's fireside, accounts of the loves of highborn maidens and the marvellous beauty of duchesses are far more popular than the narratives by which some politicians would be glad to supplant them.

The old English popular literature is profoundly aristocratic in its tone. The vices of all sorts of people are lashed unsparingly; but the lord, the knight, or the gentleman is almost always, whatever his character, held to be something better worth thinking of than the yeoman or the churl. In *Chevy Chase* it is the doings of the men of knightly lineage that are recounted. In the *Blind Beggar's Daughter of Bednall Green* the climax is not reached until the fair heroine is not only well married and richly dowered, but is also proved to be of the highest possible Norman lineage:

"A grave, a grave, Lord Barnard cried,  
To bury these true loves in;  
But lig my ladie on the upper side,  
For she came of the nobler kin"—

is the keynote of our popular legends.

In Germany this was not so. There the cruelty, and still more the rapacity of the lords, uncontrolled by any strong central authority, had branded into the hearts of the people a feeling of suffering and wrong unlike anything we have ever known. Instead of the loving tenderness of England and Scotland, there is in the old German literature a stern dark feeling of hate which shows itself by attributing to the "upper classes" all the darker crimes by which our common nature is subject to defilement.

Speaking of the comic literature of what the authors call the third period, that is 1350-1525, they tell us truly that "the chief objects of the satires ..... are the clergy and nobility; but the wealthy townmen are not spared. The peasantry are mostly allowed to escape easily." English literature is rich enough in anti-clerical fiction, but there is much more of it in the older German than in the English of

a corresponding date. Before the storm of the Reformation it would seem that the priesthood were much more unpopular in Germany than with us. The whole of this chapter on the old comic and satirical literature is very valuable. Among the stories quoted as specimens of what was once considered humour is the following:—"A parish priest is described so fatuous, that he cannot remember the days of the week. To help his memory, he makes on every week-day a birch broom, and by placing his six brooms in a row, and frequently counting them, he knows when Sunday comes, and prepares to read mass. A wag steals away the broom that should mark Saturday, and on Sunday morning the priest is found making another broom instead of going to church."

The fun of the thing does not seem very racy to us, but the tale has an interest beyond whatever little humour there may be in it. The very same story is popular to this day in England, and as we believe in Wales also, only in our version the priest makes baskets, not brooms, and he was not a fool, but a drunkard who had spent Saturday at the alehouse and therefore neglected to make the sixth basket.

Though there has been no lack of attention, the authors have thought fit to be more concise in treating of modern German philosophy than in the other parts of the volume. We have said before that we are sorry for this conciseness, but here it is not so much to be regretted as elsewhere, as philosophy is a subject to which it is impossible to do justice in a book of outlines, however much extended. What is said is very well put, and nothing could exceed its general fairness. See for example the paragraphs about Arthur Schopenhauer, a man concerning whom most Englishmen who have heard of him think they have the jester's privilege of talking without taking thought.

It is in the parts that relate to historical literature that the heavy pressure of condensation has reached its *maximum*, and here perhaps we really want light more than on any other branch of the subject. If the authors would give the English reading public a guide to German historical literature, they would confer a great boon. We are sure from what we have before us that if they undertook such a work it would be well done.

EDWARD PEACOCK.

### LITERARY NOTES.

Mr. Austin Dobson, the author of *Vignettes in Rhyme* (H. S. King and Co.) has judged himself out of his own mouth: he says in a poem in which *Une Marquise* is taken to task with considerable severity.

"We have passed from *Philosophe*—dom  
Into plainer modern days,—  
Grown contented in our oafdom,  
Giving grace not all the praise."

His own words explain the limits of the excellence which may still be attained by writers of *Vers de Société*, of whom Mr. Dobson is among the best, only second, if second, to Mr. Locker, who still finds a large public even in these dull days to derive amusement from his fancy. The fact is that if a man with an habitual conviction that jesting can under no circumstances be the business of life, finds that after all his own most valuable faculty is jesting, he is likely to exhibit a certain want of energy in the exercise of that faculty. Delicacy without insight, lightness without gaiety, smoothness without ease, melancholy without tenderness, reflection without wisdom, is all that we can expect under these conditions; and this is what Mr. Dobson gives us at its best, with a sort of accomplished fluency that is pleasant in itself, and produces a kind of agreeable distraction in the reader which bears about the same relation to merriment that ice cream soda bears to champagne. He has a great affluence of well assorted detail that is about as likely to catch our

interest as a well arranged curiosity shop, and deserves it about as well; though of course if life were really well, that is to say pleasantly employed, nobody would care to look at *bric à brac*, or to read this sort of gossip about it,—

"This was the matter of the note,—  
A long forgot deposit,  
Dropped in an Indian dragon's throat,  
Deep in a fragrant closet;

Piled with a dapper Dresden world,—  
Beaux, beauties, prayers, and poses,—  
Bonzes with squat legs undercurled,  
And great jars filled with roses."

These stanzas are taken from a poem called "A dead Letter," about an eighteenth century girl who made love to an eighteenth century young man: there is a good deal of the same kind of thing, that is a little too flippant to be tender, and a little too airy to be quite prosaic. "A Revolutionary Relic," though it seems as independent as the rest, is full of curious coincidences with one of Longfellow's manners, probably because the constraint of double rhymes has had the same effect on both. Here are the first stanzas:—

"Old it is and worn and battered  
As I lift it from the stall;  
And the leaves are frayed and tattered  
And the pendant sides are shattered,  
Pierced and blackened by a ball.

'Tis the tale of grief and gladness  
Told by sad St. Pierre of yore,  
That in front of France's madness  
Hangs a strange seductive sadness,  
Grown pathetic evermore."

Here is a stanza from "The Story of Rosina"—a fruit-girl with whom Boucher almost fell in love, and who died of his desertion of her—which is a pretty enough description of his work under the influence of his ordinary *amourettes*:—

"Her Boucher served till Nature's self betraying,  
As Wordsworth sings, the heart that loved her not,  
Made of his work a land of languid Musing,  
Filled with false gods and muses misbegot;—  
A Versailles Eden of cosmetic youth,  
Wherein most things went naked, save the Truth."

"Lydia Languish" is a not unworthy pendant to Praed's "My own Araminta say No," though Praed's generation was much higher spirited than ours. "The Peacock on the Wall" is less successful; it recalls without by any means equalling Lewis Carroll's really humorous ballad of the "Popinjay" in *Phantasmagoria*. "Before Sedan" is a rather tame echo of Hood's sentiment, and there are seven poems towards the end that show that Mr. Dobson could be if he pleased a creditable camp-follower of the neo-mediaeval school. "The Virtuoso" is a neatly turned portrait of a subhumorous egoist; "An Autumn Idyll" is a really sprightly burlesque of the *Eclogues*, and there are a couple of Odes of Horace pleasantly diluted.

Captain Bedford Pim, R.N., is an ardent enemy of Prussia and an enthusiast for Napoleonic ideas; these tendencies lead him to emphasize much that is now nearly forgotten, and so make his *Chronicle of the War between France and Prussia* (Provost and Co.) less tedious without making it less trustworthy, though a severely impartial reader might object that the partisan sympathies of the writer lead him to obtrude comment and emphatic detail in a way which disturbs the perspective of events.

Mr. Henry Sewell Stokes has been making verses, or as he calls them poems, for more than forty years now, and his *Poems of Later Years* (Longmans) show that he might have been worse employed. "The Chantry Owl" has some really amusing fancy (in part iii.) as to the birds that different authors may turn into, and the places they will haunt; and "Feeble and Old," and "So have I," and perhaps even "Life," deserve a place in second-rate anthologies. As much may be said of "Music," "I Keep my Kisses for my Wife,"

and perhaps "Sister Therese," in Godfrey Egremont's *Poems and Songs* (Provost and Co.).

*Après* of anthologies, the Rev. Francis Jacox has with practice become very nearly a perfect bookmaker; in his early works he gave us a little too much of himself, and his reflections were on a level with A. K. H. B.'s. At present he has attained the art of constructing almost perfect patchwork out of his reading: he is certainly the benefactor of all who have the wish to read and have not the will or power to read much; and even people who read a good deal will often be grateful to him for having read for them books they might be too proud or too lazy to read and remember for themselves. *At Nightfall and Midnight* (Hodder and Stoughton) treats copiously of such topics as Noctambulism, Night Students, The Looks of the The Last Sleep, and the like: we feel that the author's commonplace book, or one of his commonplace books, is being poured out on us, and wonder to find it so well filled, and that the contents flow so equably. It is curious that the author cites Macaulay's lyric on "The Last of the Buccaneers," not Kingsley's.

There was a certain union of tenderness and acuteness in Mr. Birks' *Victory of Divine Goodness* which made it possible that future works of his might deserve attention. His *First Principles of Moral Science* (Macmillan) go far to show that the distinction of one work was due to the painful interest that a special subject had for the writer, and that where he feels no anxiety it is natural for him to expatiate in flowery solemnity and pompous plausibility without any distinction at all. Mr. Birks assumes without analysis the ostensible moral notions of the present day and the current moral phraseology, and of course this supplies him with a canon for the condemnation of all systems which do not make the same assumption. His mathematical training enables him to freshen up the old objection about the calculations which utilitarians are supposed to be called to make: and his lecture on morals and political economy is sensible, and succeeds (with the help of M. Play) in saying a good deal that Mr. Ruskin has lately been trying to scream. Mr. Birks has reprinted a prize essay on Mathematical and Moral Certainty which proves conclusively that forty years ago he was if possible more flowery, decidedly more fluent, and quite as profound as now. He discusses with two of his predecessors, Dr. Whewell and Mr. Maurice, the important question in what sense he is a professor of casuistry: meanwhile it is not surprising that the Moral Philosophy Tripos is as unpopular at Cambridge as the school of Natural Science at Oxford.

We have great pleasure in recommending to the attention of our readers the *New Shakspeare Society*, a prospectus of which we have received. According to the proposals of its founder and director, Mr. F. J. Furnivall, its work will be twofold. First, at the meetings of the Society, which are announced to commence in March next, short papers will be read, to be followed by very full discussions, on the most important points of Shaksperian criticism. The chronology of Shakspeare's plays, the great periods of the Poet's work, the state of the text and value of conjectural emendations, the pronunciation and spelling of the English of Shakspeare and his contemporaries, are among the subjects to be thus treated. Secondly, the young Society will resume the work, so admirably carried on by its predecessor, of publishing a series of texts illustrative in various ways of the Plays and Poems of Shakspeare, the social characteristics of his age, and the history of the English drama; and it is proposed to add a Handbook for Learners and a scholarly and adequate life of the Poet. The *New Shakspeare Society* already includes the names of many of the most eminent Shaksperian scholars in all parts of the world, and we hope that it will receive that large measure of support which it will most assuredly deserve. The subscription is fixed at a guinea a year.

Messrs. Rivington have just issued the first volume of their series of "Historical Handbooks,"—*The English Institutions*,

by P. V. Smith, Barrister-at-Law; the second volume, *The History of French Literature*, will be ready at the end of January. They also have in the press a continuation of Thucydides, Books 3 and 4, by G. A. Simcox, forming one of the *Catena Classicorum*; a *Manual of Building Construction*; a *Key to Hamblin Smith's Algebra*; *Algebra Part II.*, by E. J. Gross, M.A.; a Greek Grammar by Evelyn Abbott, and *Campaigns of Napoleon—Jena and Waterloo*, by E. E. Bowen.

## Art and Archaeology.

### MR. HOLMAN HUNT'S NEW PICTURE.

THE "Shadow of Death" may be considered in three lights—as a painting, as a picture, as a sermon, for we are assured on authority that it was "painted in the conviction that Art, as one of its uses, may be employed to realise facts of importance in the history of human thought and faith."

As a painting it is beyond praise: the heroic realisation of every detail is carried far enough to convince us, if it were possible, that it was worth four years of the prime of a great artist to form and paint a collection of carpenter's tools not only Eastern but ancient, and a saw with the teeth turned upwards, and hundreds if not thousands of shavings, and a tressel of a form common in the East and still to be found in Italy, with the same devotion as the sunset sky and the rosy hills of Galilee, which are seen through the open arch in which the principal figure stands relieved against the sky: the spectator should on no account omit to notice the really lovely quality of the shadow of the tressel on the shavings.

And as a picture? A picture can hardly be judged without appeal except by the consent of painters: the kneeling blue-robed figure turning startled from the half-open casket is full of literal homely life, and yet has a splendid learned grace besides; the red fillet on the floor, the opensky beyond, the tawny sinewy figure in the middle, the pomegranates on the window-sill are all things that it would have been pleasant to see together in the sunlight just as they happened to come, and Mr. Hunt paints far too powerfully to weaken their pleasantness in the least: and yet—though it is hard to paint a pleasant sight as Mr. Holman Hunt can paint it—we hardly feel that we have been helped to make the great step that separates pleasant sights from a picture, and after all this is as great as the step which separates a pleasant noise from music: and again it is easier to feel sure that the picture has been painted in Eastern sunshine than that it is a picture of Eastern sunshine.

And as a sermon, as a sacred poem upon canvas? that will be the principal thing for most spectators—one feels sure it has been the principal thing for the artist; if it is right to speak of the picture at all it must be right to speak of this. We are told that "one of the problems of our age concerns the duty of the workman; His life, as now examined, furnishes an example of the dignity of labour." Well there can be no doubt, whatever we think of the subject, that the picture itself "furnishes an example of the dignity of labour." For many this will be enough; they will ask nothing better than to believe in the sacredness of what is put before them with such loving patience, with such clear intensity, with such sustained unwavering conviction.

It has been said that the kneeling figure of the Mother is in itself beautiful and masterly; but why are the bare feet white with dust? has she been out to draw water? was there no one to do this for her, that she might keep the seclusion which is the ideal of Eastern womanhood unbroken? Then is the periodical inspection of the Wise Men's Offerings precisely an ideal "aid to faith"? and to come to minor points, is there the slightest reason to think that there was ever a crown made half way between the diadem of the Herods and the tiara of the Parthian or Sassanian dynasty? But beautiful as it is, the figure of the Mother is secondary; even the symbol of the crucified shadow with one of the hands falling so that a nail in the tool-rack comes just in the middle is secondary too, and as for the tertiary symbols with which the picture overflows, they are at best a kind of Sunday puzzle for child-

ren of a larger growth. One must judge the work as a whole by the face and the figure of the Carpenter, whose uplifted hands cast the Shadow of Death upon the wall behind. There is a deliberate and of course quite defensible rejection of all academical idealism, and yet the very thoroughness of grim realism leads the artist to an idealism of his own—there is something half superhuman in a nearly naked figure so articulate throughout as the artist's method requires. Then there is a pathetic truth in the attitude, with the fingers still cramped by the day's work. The face is raised and thrown backward; it is surrounded by a tangle of chestnut hair and beard, a little matted with the burden and heat of the day (this makes us ask if the flesh of the body is not too dry?), and deep blue liquid eyes. The expression is intense at any rate, only it would be perfectly accounted for by supposing the Carpenter to feel keenly for Himself and for His brethren the mere hardness, weariness, narrowness of the mortal lot He bears so patiently—and hereupon appeal to heaven and earth for sympathy. If the artist intended to ask for compassion, respectful compassion, he has not asked in vain; but a spectator may ask in return, Is mere sacred Carlylese self-pity an adequate motive for a religious picture, for a picture of the central figure of a great religion? to come to lower ground, is this worthy of the spiritual power of the painter of "The Light of the World," of the intellectual power of the painter of "Christ in the Temple," where the ingenuity is still dramatic as well as hieroglyphical?

The painter seems to have carried out his conception completely with unparalleled devotion, with indefatigable energy, with conscientious austerity: it is sad that conception should be so soft and poor: the first thought the picture suggests (it is some time before the strangeness lets one think) is "Carlo Dolce realised"; if Carlo Dolce can be realised, Mr. Holman Hunt has come to be the man to do it: would this be a gain? the Christs of Carlo Dolce were at least conventionally divine.

G. A. SIMCOX.

### THE WINTER EXHIBITION OF THE SOCIETY OF BRITISH ARTISTS.

ONE always knows what to expect in Suffolk Street—a wide expanse of comfortable pleasantness that disdains curiosity and fears aspiration, hundreds of pictures one would not be sorry to see on the walls of acquaintances and a few that one would be glad to see on the walls of friends, a few contributions by people who can exhibit elsewhere, and a great many from those who have an excellent right to exhibit there.

Perhaps we may speak first of the two things that are least like what we had the certainty of seeing: one is 778 (H. Bright)—

"Returning victors from the field of fight,  
Our gallant frogs present a gala sight."

The frogs take up all the picture and are carefully drawn, and act human beings with humour enough on their hind legs: the other is 568, "Wells Cathedral—a frosty morning" (A. Parsons).

Of the ordinary poetry of sunset and sunshine there are many examples; one may quote "Stoke Bridge," 10, by A. Clint, and 45, "Rydal Mere," by T. Peel: in a quieter vein we have "A Bright Morning after Wind"—not very bright—by H. Moore (84). "A View in Italy," W. Tennison, 498, and "Harvest Time on the South Coast," W. Gosling, 508, would make capital chromo-lithographs. But lithography would hardly do justice to G. Hartley's "Early Morning," 560. Miss Mortalba's "Il giardino publico," 28, is worth notice because the sea and sky look as if they had been painted a good many years ago, and the trees look as if they were hardly quite painted yet. Of figure subjects the most conspicuous are Mr. Bauerle's "Children," 156, 492, 566, with a kind of smoky grace which is one aspect of children in real life, only Mr. Bauerle reproduces it at the expense of representing his children as made of smoke altogether. One may notice besides Mr. Bromley's "Early Lessons" (89), some men sitting drinking and playing, while one is fencing with a boy; "An Undoubted Original," E. Hughes (127), two connoisseurs looking at a new purchase; "A Street Ballad," by W. J.

Henessey, 107; "On Guard," J. T. Nettlehip, 257. If space and patience held out, one might mention many more all in a way well deserving "fortemque Gyan fortemque Cloanthum." G. A. SIMCOX.

### THE THEATRE.—"THE ROAD TO RUIN"

THE newspaper notices of *The Road to Ruin* have perhaps scarcely as a whole done justice either to the piece or its performance. At all events one may venture to hold a somewhat higher opinion of both than that which has been generally expressed. At the Vaudeville, Holcroft's comedy—the only one of his thirty plays that has survived to our day—followed upon four hundred consecutive representations of *The School for Scandal*; and what test can be more severe than that of juxtaposition with Sheridan's unwearying *chef d'oeuvre*? As literary work, it is of course impossible to make comparisons between the two, but the more cultivated of our play-goers are likely rather to under-rate than to over-rate the merits of *The Road to Ruin*—merits of a kind which in the literature of the imagination are not just now in fashion. The piece is remarkable for bristling incident and for robustness of conception. The plot is firmly and ingeniously knit, and might in other hands have served to display and develop a group of more original and interesting characters than it was within the scope of Holcroft's art to embody. To a modern mind, the faults lie on the surface. First, there is poverty of invention as regards the characters, of whom one only—that of Goldfinch, the amateur coachman—was at all new; and he, be it remembered, was a mere untouched study from nature: valuable, no doubt, and amusing, for his truth to a contemporary hobby of high life, but wholly superficial, and in no sense to be accepted with the character-studies of such artists as Sheridan and Goldsmith. Secondly, there is the complete absence of literary grace and charm. The dialogue is never better than smart. From beginning to end there is not a brilliant line, nor a beautiful one. But it is sometimes funny and often effective: the work apparently of a writer who did not aim high, but who had the good fortune to know, precisely, that at which he was aiming, and the experience required to hit it without fail. And thirdly, the absence of most good qualities of style is not atoned for by the introduction of catch-phrases—such as the "that's your sort!" which Goldfinch says a score or so of times—phrases to which age cannot impart wit, and which have place enough allowed them if they are tolerated in farce and in burlesque. But, these deductions made, there remains, as has been indicated, a robust work, full of movement and interest—interest more in the thing now passing than in the end which is to come—and to the acting of this work there are attached countless traditions, so that the players find themselves the inheritors of ready-made parts, which it is undoubtedly their business to alter and improve as they can.

Our generation has seen Charles Mathews as Goldfinch; and, in it, it has not seen him at his best. He was lighter, he was more mercurial, than Mr. David James; yet I doubt if he were better-humoured, and feel sure he was not so absolutely "horsey." The most sympathetic character is that of Dornton, the fond yet hardly feeble father of the good-natured scape-grace who stands for hero. Mr. William Farren looks the part quite perfectly—following, one imagines, pretty closely in his father's steps, and certainly presenting us with such a benign and restful and highbred face as might look out upon us from the canvass of Reynolds. His performance is not one in which there are special moments to notice. It is beautiful and dignified. It is finished and harmonious: seemingly without effort, and happily without fault. Young Dornton is represented by Mr. Charles Warner, with an amount of force and of feeling with which those who saw him, only a very little previously, in his colourless rendering of Charles Surface, are all the more delighted because it is distinctly a surprise to them. He is good in the earlier scenes; judicious in that most difficult and it must be said also most repulsive scene with Widow Warren; and best of all in that scene with his friend, when, half lost with disgust and despair, he is yet screwing his courage to the sticking-point, that the business-credit of his father may be redeemed by his espousal of the widow. Silky and Sulky are conventional characters, but effective stage parts. Mr. Thorne plays the

one with the requisite unction, and Mr. Horace Wigan the other, with the requisite stolidity. Miss Larkin, who (especially by her admirable performance in *Time Works Wonders*) has taught us to expect good things from her, is a little disappointing as the Widow; but that is perhaps because the widow in question is quite the most detestable and selfish of waning coquettes. The hoyden heroine-by-courtesy (Sophia) promises, as a character, more than she fulfils. The best talk of the play proceeds from her in her first scenes; but subsequently she collapses, and becomes a minor part—existing only that young Dornton may be provided with an agreeable wife when his troubles are over. Miss Amy Fawsitt is the Sophia at the Vaudeville; so that we have that which on the English stage is unhappily a rare spectacle—an insignificant character played by an accomplished *comédienne*. Miss Fawsitt gives a force and meaning of her own to every sentence uttered in this part.

### "ARKWRIGHT'S WIFE"

THERE seem to be two great faults in the drama of *Arkwright's Wife*, now played at the Globe Theatre: one is a fault of construction and the other a fault of taste. The second is much approved of by people in the gallery, and it has contributed somewhat to the success of the drama. But the first has materially interfered with that success—nay, it has been the one thing to prevent that success attaining any unusual proportions; for without it, the piece would be played for three hundred nights, and what is more, would in the main deserve to be. For it is distinctly a play with an idea; that idea, the difficulty of an exceptional struggle and the cost of an exceptional triumph. But the poverty and weakness of the third act—which is the last—cause the public to receive with respect and interest what otherwise they would receive with enthusiasm. Mr. Tom Taylor is too skilful and too practised an Art-workman to have invented the third act as it now stands, had the work, from the first conception of it, been destined for the stage; but though the playbill does not state it, the drama by Mr. Taylor and Mr. John Saunders is understood to be derived from a novel by the last-named author; and it is quite conceivable that the material of the novel was held to be on the whole too good to reject, merely because the use of it necessitated a conclusion less forcible on the stage than in a printed book. The strong fibre of the first and second acts, the continued and sequent action and the really powerful interest, are nevertheless in strange and unfortunate contrast with the weakness of the third, which has for its *raison d'être* a sort of poetical justice—the wife who long ago broke Arkwright's first spinning-jenny, now saves from destruction the mills of which at last he is master—but even poetical justice is late, and not very effective or very welcome, when it comes after twenty years; and we look on these renewed loves of a now middle-aged couple without very keen sympathy—notwithstanding the agreeable assurance which one of the minor characters gives to the wife's father, that "they will make him a grandfather, after all." Indeed this old man, Peter Hayes, has done nothing to merit the advantage which is promised him; and is it not a little fault—we have spoken already of one of the two great ones—that the malevolent nature of this old man is changed so suddenly at the end, and that the enmity of twenty years is forgotten in a minute? That which, unless we are mistaken, is a grave fault of taste, is not the purely comic but purely *low-comic* business between the barber and the man he shaves, in the first act. To see a man lathered and shaved on the stage is to the gallery almost as delightful a thing as to see a stage feast of real toast-and-water, and hungry Jeremy Diddler's cheeks swollen out with his host's bread. What one is pleased to call the imaginative faculties of our uneducated playgoers are stimulated by the presentment of all the mean details of every-day life. This realism, not of Nature but of common-place, is a thing for which they have a never-failing relish; and the introduction of it has turned many a good drama into that dullest of all dull dramatic things—a dull farce. Mr. Robertson many times yielded to the temptation thus produced (yielded notably in giving us the detestable gas-fitter in *Caste*, acted by Mr. Hare so wearisomely well); and if it be not impertinent to say so, Mr. Tom Taylor would have attained more uniform excellence as an artist, had he, in recognising this temptation, known always how to be proof against it. When a man is capable of rousing so strong an interest in his

story as is undoubtedly roused by most of *Arkwright's Wife*, and when he can write such dialogue as that in the second act, which has about it the ring of great comedy—of high imaginative work—he can afford to leave shaving and eating and boozing to those makers of dramas who are really in need of such support.

*Arkwright's Wife* is fairly acted by all who appear in it: excellently by the representatives of the three chief characters—the wife, the husband, and the wife's father. In Miss Helen Barry's performance in the first act, there is a touch of Miss Kate Terry's manner, both in gesture and in voice. It is not easily describable, but it is certainly there—like a scent which vanishes the moment you detect it. Miss Helen Barry has much power of facial expression, but this is not always under complete control: the intention being better than the execution. She is a little too vigorous and peremptory—not to say disagreeable—when Arkwright is admiring Margaret's hair, first as barber and presently as man. But her acting is intelligent throughout, and more than once very suggestive—her tone of irritation when she discovers that her jealous fears are shared by a friend, and cannot endure them to be mentioned, is a thing well found and excellently done. Wherever a graceful cajolery is required; or special freedom of stage movement, there the actress is completely efficient. She is good where she may be strong and demonstrative; but she is at present less able to convey suppressed emotion than to make violent and eloquent appeal. Mr. Kelly acts Richard Arkwright with commendable reserve and unwonted repose. He indicates very ably the quiet self-reliance of the man, and his readiness, and his freedom from the irritability of the genius that is artistic: this genius that is inventive in the mechanical arts has a patience less broken by excitement. The dreamy old father, whose blessing and whose curse it is to possess gifts which make him too clever to quite go along with his mates, yet not clever or strong enough to lead them,—a man too gifted to be successful in common paths, and not gifted enough to be successful in paths that are new—is represented by Mr. Emery. He is what is called a "character-actor;" always of old men; and he enters fully into the nature and the ways of this one; being by turns ingenious, and obstinate, and malicious, and doting, and dreaming.

FREDERICK WEDMORE.

#### NOTES ON ART.

On the occasion of the inauguration of the statue of Massimo d'Azeglio at Turin, which took place on the 10th of November, at the same time as that of the statue of Cavour, the Marquis d'Azeglio, Massimo's nephew, presented to the town a collection of paintings, drawings, and other mementos of his distinguished uncle, "in order to form," as he states in his letter to the syndic, "a Massimo d'Azeglio Museum in his native town."

An article on "Art and Archaeology at the Theatre" by Alfred Darcel appears in the present number of the *Chronique*. It is apropos of the play of *Jeanne d'Arc*, which is now being represented at the Gaité Theatre in Paris with great decorative and scenic effect. The costumes, we are told, have all been copied from manuscripts of the age represented in the play, even the slight differences in the armour of the French and English knights have been carefully observed. The scene at the market-place is described by M. Darcel as "very picturesque," but he finds fault with the architecture of the houses, which belongs to the latter half of the fifteenth century, whereas Jeanne d'Arc was burnt at the beginning of the century. Surely if such exactitude as this is required of scene painters, a little more might be demanded of so-called "historical painters," whose pictures are often anything but "abstract and brief chronicles of the time" they represent.

The winter art season may fairly be said to have begun. The winter exhibition of the Society of Painters in Water Colours, of the Institute of Painters in Water Colours, the exhibition of cabinet pictures at the Dudley Gallery, of British and Foreign Artists at the French Gallery, of the Society of French Artists, in Bond Street, of the studies of Edouard Frère, at Messrs. Agnew's Gallery, in Waterloo Place, of the Old British Gallery, of Doré's "Night of the Crucifixion," of the engraved works of Sir Edwin Landseer, and (most noteworthy of all) the exhibition in solitary glory of Holman Hunt's long

looked for picture of "The Shadow of Death," are now open in London, and will help lovers of art, art critics, and art loungers to while away a few afternoons in "drear December."

In France, the most important winter exhibitions seem to be in the Provinces, the Oriental exhibition at the Palais de l'Industrie being the only one of interest now open in Paris. The Society of the "Amis des Arts de Lyon" announces its annual exhibition for the 9th of January, 1874. Rheims follows with an exhibition in February, and Bordeaux in March. The Versailles Salon of the *Jeu de Paume* will close this month. It has been, say the critics, a very satisfactory exhibition.

The *Gazette des Beaux-Arts* is scarcely as good this month as usual. "Les Editeurs Contemporains," the title of the first article, describes the numerous works on the Middle Ages recently published by the well-known firm of M.M. Didot, whose name "consacré par trois générations d'hommes célèbres dans la librairie française, se rattache à toutes les innovations survenues depuis un siècle non seulement dans la typographie mais encore dans la direction générale des études littéraires." The praise accorded, though undoubtedly well deserved, would have more weight if the article did not read so much like a publisher's prospectus. It is profusely illustrated by engravings borrowed from the works it describes, the most important being a heliograph from Marc Antonio's magnificent engraving of Raphael's "St. Cecilia."

Le Comte Clément de Ris continues his description of the pictures in the Belvedere at Vienna, and M. G. Demazis his learned study of "The Seals of the Middle Ages." Mr. C. T. Newton gives a list for the benefit of French readers of the new fragments of the frieze of the Parthenon, which he described in the *Academy* some time ago (vol. iii. p. 283). "Le Musée de Nancy et les collections d'Alsace-Lorraine" receive a first notice from M. Charles Cournalt, and M. Duplessis gives a short biographical notice of the French artist Célestin Nanteuil, who died in September of the current year. Nanteuil is perhaps better known in England as an illustrator of books than as a painter, but his pictures of "L'Avenir" and "Les Souvenirs du passé," lithographed by himself, may be remembered by some of our readers.

In a paper entitled "Du sens Esthétique chez les Animaux et chez l'Homme," M. Louis Viardot not only argues against the Darwinian doctrine of an aesthetic sense in animals, but limits the possession of this sense exclusively to civilized man. Savages, he asserts, have no appreciation of the beautiful. In support of this opinion he quotes a story of some Australian aborigines who were shown the portraits of the Queen and Prince Albert. After some minutes' consideration one man stated that he thought the picture was "a ship," while another cried out "It is a kangaroo!" We are not so sure, considering the villainous libels we have seen in the shape of portraits of these royal personages, whether these poor savages were so far wrong after all, and whether it is not rather an argument in favour of their possession of an innate aesthetic sense that they failed to recognise "le beau" in this particular work.

M. Louis Viardot's argument is weak throughout. He is an excellent popular writer on art, but we should advise him to leave it to able physiologists to refute an induction founded on the observation of Charles Darwin.

The remainder of the number is filled up by a useful but not complete list of works on the Fine Arts published during the last half-year and the index to the volume now completed.

"The artistic event of the week in Paris," says *Le Figaro*, "is the apparition of a new work by Hébert, that has just arrived from Rome." It is a painting of a grand female figure unembarrassed by much costume set in a misty landscape among iris and reeds.

The correspondence headed "An Artist's Difficulty" that has recently been carried on in the *Times* respecting the right of the photographer to keep the negatives of the pictures he is employed to photograph, has provoked the discussion of a subject upon which there is much need of a clear understanding. Mr. Frith, considering that he was unfairly treated by the Autotype Company's refusal of his demand for the negatives of his pictures, tells his grievance to the public by means of the *Times*. The Secretary of the Autotype Company replies that the retention of

negatives is "the custom of the trade as universally accepted, and generally understood to be endorsed by law." Such is undoubtedly the custom, but the law, so far as we can understand, is very hazy on the matter, or rather it has not considered it at all. Mr. Frith ought to have known, indeed must have known, of this universal custom, and we cannot see that he has suffered any especial "injustice." If he wanted the negatives he should have made a definite arrangement to that effect beforehand; otherwise, as the custom now stands, "injustice" would be done to the photographer, who, as Mr. Mayall points out, "gives to his negative time, skill, and attention altogether out of proportion to the honorarium he is working for at the moment; and he does this with the distinct purpose of rendering the negative a valuable one for the future." The remedy of the artist lies at hand, and his "difficulty" after all does not seem insurmountable. Let him pay the photographer in proportion to the "time, skill, and attention" that he gives to his work, and then, if it is so understood beforehand, the negatives will be his property as much as the copper-plates of his prints. Indeed M. Adolphe Beau already advertises that all negatives taken by him may be purchased at a price corresponding to their artistic value.

### New Publications.

- ARMELHAULT, J., et E. BOCHER. *L'Œuvre de Gavarni*. Paris: Lib. des Bibliophiles.
- BAUR, G. A. L. *Boetius und Dante*. Leipzig: Dürr.
- BECQ DE FOUQUIERES, L. *Poésies choisies de P. de Ronsard*. Paris: Charpentier.
- DASENT, G. W. *Tales from the Fjeld. A Second Series of Popular Tales from the Norse of P. Chr. Asbjørnsen*. Chapman and Hall.
- GENERYDES, a Romance in Seven-line Stanzas. Part I. Ed. W. Aldis Wright. (Early English Text Society.) Trübner.
- GOSSE, E. W. *On Viol and Flute*. King.
- HAVARD, H. *Les quatre derniers siècles. Etude artistique*. Livr. 1 et 2. Berlin: Pfeiffer.
- HITOPADESA. Eine ind. Fabelsammlung. Uebers. v. L. Fritze. Breslau: Hoffmann.
- LAUR, E. Louise Labé. *Zur Geschichte der französischen Litteratur d. xvi. Jahrh.* Strassburg: Trübner.
- MAERLANT, J. van. *Spiegel historiael. 2. partie, bewerkt door Philip Utenbroeke. Vanwege de Maatschappij der nederlandsche Letterkunde te Leiden uitgegeven door F. v. Hellwald. 1. en 2. Afl. Leiden.*
- MONTAGNAC, E. de. *Les Ardennes*. Paris: Rothschild.

## Theology.

### Contents of the Journals.

[The following were accidentally omitted from our last number.]

**Theolog. Literaturblatt.** [The learning, high general culture, and moderation of this organ of the liberal Catholics of Bonn should render it highly acceptable to the majority of English theologians. Its collapse would at any rate be a loss to theological science, and we unite with an esteemed contemporary, the *Guardian*, in recommending it to the support of our readers.]—The following are among the articles of most scientific importance within the last two months: Oct. 11.—Adolf Schwarz *Jüdischer Kalender*; reviewed by Dr. Flöckner, with remarks by Prof. Lutterbeck at the close, based on the calendar, on the chronology of the life of Christ.—Oct. 25.—Renan's *L'Antéchrist*; by Prof. Langen, of Bonn, who observes that M. Renan has avoided many of the critical extravagances into which the Tübingen school have fallen, owing to their "dogmatic rationalism" (scarcely a successful phrase!), but that his historical attitude has not preserved him from the wildest

assertions on doctrinal points, e.g. on the origin of the doctrine of individual immortality among the Jews (p. 467). He has also pressed the Neronian hypothesis extravagantly far.—Nov. 8.—Hausrath's *Neutestamentliche Zeitgeschichte*; by Prof. Langen. This work deals with the same subject as Renan's *L'Antéchrist*; but while the latter employs contemporary history rather as a commentary to the Biblical material, Dr. Hausrath devotes equal care to all parts of the history of the period. Prof. Langen had already expressed a highly favourable opinion on the ability and thoroughness of the work, though these merits are neutralized to him by the heterodox position of the author. In the same number, Kuno Fischer's last volume, relating to Schelling, finds an appreciative reviewer in Dr. Katzenberger (O. Jean Paul!).—Nov. 22.—Immer's *Hermeneutik des N. T.* is noticed with discrimination, but on the whole favourably, by Prof. Langen. It is described as above the average of students' handbooks, thoughtful, and pervaded by a high moral tone. Zeller's *Lectures on State and Church* receive an impartial recognition from Prof. Weber of Breslau.

**Zeitschr. f. wissensch. Theologie**, 1873, No. 4.—The first epistle of Peter; by A. Hilgenfeld. [A new Petrine question raised by I. r. B. Weiss, who contemptuously rejects the arguments of the Tübingen school against the genuineness of the first epistle, and now undertakes to prove the genuineness of the second. But if the Tübingen critics were right as regards the first epistle, the genuineness of the second, which contains a reference to the first (iii. 1), is ipso facto disproved. Hilgenfeld here enters the lists for the old Tübingen view, though he admits that it had one fault, that of giving too much prominence to the irenic purpose of the epistle.]—The composition of the Gospel according to Luke; by C. Wittichen. [In its present form a monument of those endeavours of the Jewish Christians in the Roman church which issued in the Clementine literature.]—Philo and the traditional text of the LXX.; by C. Siegfried, conclusion.—Abraham, the "Friend of God"; by H. Rönisch. [Accounts for the phrase by a derivation of Abraham from *ráham*, supposed to equal *ríkham* to love. Refers among the other ancient explanations to the well-known one of Molon in Eusebius, but overlooks the remarkable fact that in Assyrian *ráham* does coincide in meaning with Heb. *ríkham*, whence Harkavy actually proposed as the true meaning of Abraham "père de l'amour," *Revue Israélite*, No. 6.]—Notices. Edition of Codex Amiatinus; rev. by K. L. F. Hamann (who points out the manifold imperfections of the edition, and purposes to examine the codex on the spot), &c.

**Theologisch Tijdschrift**. November.—On the history of the ancient (i.e. national) religions, its method, spirit, and importance; by C. P. Tiele. [Introduction to a course of lectures.]—Permanent significance of the Gospel of the Cross from the modern point of view, part i.; by S. Hoekstra.—Moses and the Exodus in connexion with Egyptian documents; by C. P. Tiele. [Chiefly on Eisenlohr's and Chabas' researches on the Harris papyrus. Mr. Tiele, who prefers the version of M. Chabas, is unaware that Eisenlohr has published the text with translation and notes in the *Transactions of the Soc. Bibl. Arch.*, vol. i., p. 355, &c.]—Prof. Fraser's edition of Berkeley; by Dr. van der Wijck.—Notices of Books. Ewald's *Die Lehre der Bibel von Gott*, vol. ii.; by Kuenen, &c. [According to him, Ewald confounds Biblical and his own dogmatic theology, a "frightful illusion," which however does not preclude many delicate and often surprising contributions to the former subject in points of detail.]

**Jahrbücher für deutsche Theologie**, vol. xviii., No. 3.—Diestel: Hebrew historical writing; an inaugural lecture.—Düsterdieck: The Prophet Isaiah; an address in the Evangelical Union.—Schmidt: On the idea and practical importance of church dogma.—Wagenmann: Secular memories of church history (from 373 onwards).—Förster: Macarius of Egypt. [A valuable analysis of the works of the elder Macarius.]

**Bibliotheca Sacra**, Nos. 118 and 119.—Paul's Panegyric of Love: a new critical text, translation, and digest; by A. W. Tyler, M.A. [We regret not to have called attention earlier to this remarkably thorough re-examination of 1 Cor. xiii., which is said to have "cost its author at least three hours a day for nine months."]

### Intelligence.

Mr. R. L. Bensly, sub-librarian of the Cambridge University Library, has lately discovered the long lost portion of the Latin version of the 4th book of Ezra; that is, the seventy or eighty verses which have fallen out between the 35th and 36th verses of the 7th chapter. Mr. Bensly hopes shortly to publish a small pamphlet on the subject.

Mr. Neubauer, sub-librarian of the Bodleian, has in the press a collection of texts of Jewish authors on the famous chapter Isa. lii. 13-liv., with English translations. It will contain the Greek of the LXX. and Aquila, the Hebrew of the Talmud and of various commentators down to Luzzatto, the Arabic of Saadyah, Yepheth, ben Ali, &c., the Chaldee of the Targum and Zohar, a Persian translation of the fourteenth century, and a Tataric of the Karaites of the Crimea. It is understood that the expenses of publication will be borne by Dr. Pusey.

## Physical Science.

Monograph of the Collembola and Thysanura. By Sir John Lubbock, Bart. London: Published for the Ray Society.

THE reader of Kirby and Spence's well-known "Introduction to Entomology" will remember a letter in which while treating of the motions of insects the authors tell of a tribe of minute apterous beings found often under the bark of trees, on the surface of water, and in various other situations, which Linneus has named Podura, a term implying that they have a leg in their tail. By this leg these little creatures can leap sometimes two or three inches: one minute black species, which is to be found in spring floating on the water of ruts and ditches, may often be seen in such vast numbers as to look like a heap of gunpowder, the black grains of which had been ignited. Another, called by Latreille *Machilis polypoda*, abounding at East Farleigh, near Maidstone, is said to have no less than eight pair of these spring legs—one on each ventral segment of the abdomen, by means of which it leaps to a wonderful distance and with the greatest agility. It is of this little tribe of minute beings among the wingless insects that Sir John Lubbock has written the monograph the title of which stands at the head of this notice.

The first memoir on the group to which the author refers is that of de Geer—published shortly after the appearance of the first edition of the *Systema Naturae*; the spring tails had however attracted the attention of naturalists long before that date; more than a quarter of a century earlier than the birth of Linneus Rayger and Camerarius had written about and figured the insects that reached the ground with the softly-falling snow, and for many years afterwards there now, and then appeared a paper on "Insecta nive delapsa," or "Schneewürmer," all of which are related to some one or other of the Thysanura. In America we find that these little creatures are at this day called snow-flies, and we notice in passing that Loew (F.) asserts that nearly one-fourth of the recorded European species have been met with on the surface of snow, although they may also be met with all through the summer's day.

Winter does not kill them, and the ever active entomologist will find numbers of them to collect in all seasons. Franz Xaver von Wulfen wrote in 1788 a treatise under the title of *Winterbelustigungen*; and among the amusements of this season he enumerates the collecting of Thysanura. So this volume of the Ray Society's publications, though issued to subscribers late in 1873, instead of early in 1871, is though somewhat out of date not out of season, and its publication may induce some of its readers to at once investigate this group for themselves. Some may fear that Sir John Lubbock has left no fresh fields to explore; he has, on the contrary, only turned up the soil, and it will be for others now to sow and reap.

After De Geer Linneus, Geoffroy, Fabricius, and Müller described several species of Podura, and the genera Lepisma and Forbicina were established. In 1796 Latreille instituted the order Thysanura, which he divided into two families characterised by the two genera Lepisma and Podura; placing Lepisma in his first family. In this monograph the author restricts the term Thysanura to the Lepismidae and the allied families, giving the name of Collembola to the present representatives of the second family of Latreille: thus there are two groups, the Thysanura and the Collembola, which together equal the Thysanura of Latreille, and to include which some new term must be invented. We would however have preferred to retain

Latreille's name for the order, and divide it into two sub-orders: the Collembola and Acollembola.

The indefatigable Latreille, in his seventieth year and just before he died, published an extended memoir on the external anatomy of the Thysanura, and shortly after his death Mr. R. Templeton wrote a paper on Irish Thysanura, which is remarkable as being the first of any importance published in English. This paper appeared in the first volume of the *Transactions of the Entomological Society of London*, and Mr. Westwood prefixed to it some very valuable remarks on the difficulty of deciding on the affinities of the group.

The Abbé Bourlet published his "Mémoire sur les Podures" in 1839, and in 1843 a memoir "Sur les Podurelles," which latter is in reality the former memoir modified in several points, and considerably added to. Unfortunately the Abbé was not acquainted with the writings of either Burmeister or Templeton; his work appears to have been in every other respect well and conscientiously executed.

The next most important work on the group was Nicolet's "Recherches pour servir à l'histoire des Podurelles," published in 1842. If it was unfortunate that Bourlet did not see the papers of Burmeister and Templeton it was doubly so that Nicolet had not made himself master of both Burmeister's and Bourlet's writings; and to the fact that Bourlet and Nicolet wrote in ignorance of each another's labours may in great measure be traced the confusion that to this very day exists in the synonymy of the group. In 1847 Nicolet did his best to remove this confusion by publishing an essay in the *Annales de la Société Entomologique de France* for that year. "Sur une classification des Insectes Aptères de l'ordre des Thysanures," where he gives a list of all the then known species, with synonyms. We have always found this list very exact, and it even takes note of good species that have been overlooked in the enumeration of species in Sir John Lubbock's monograph. We are inclined to think that Nicolet's "Recherches" were the most important that up to 1860 had been published on the group—giving as they do details of the anatomy, and full descriptions of the external form of most of the species, and illustrating these by very excellent plates. Between 1840 and 1860 a few valuable contributions to our knowledge made their appearance, and of these we would mention the descriptions of the Algerian Thysanura by Lucas as published in the "Exploration Scientifique de l'Algérie" in 1849. The coloured illustrations of this memoir are most excellent, and might well be taken as a model. As no species or details of the genus Lepisma are figured in the present monograph we may refer the student to the figures and descriptions of the species of this genus in Lucas' work, as well as to the figures of two other species in Savigny's great work on Egypt. Frauenfeld in 1854 made out a new genus Tritomurus for a blind species, which had been found by Herr Schmid in a cave at Treffen; and Kolenati (1850) in describing a second species from the Slouper Cave, Moravia, added a new species to the genus Anurophorus (Lipura). Papon published a figure and an account of a Desoria found at Chur during a snow-storm in February, 1855. But this species is evidently only Podura (Isotoma) arborea.

If little original work was done during this period it scarcely arose from any lack of attention on the part of entomological compilers. Not only did M. Lucas, in 1843, give an elaborate analysis in French of all the memoirs that had appeared on the Poduridae up to that date, but Herr Eldett did the same in 1854 in North Germany, and Herr Kolenati in 1858 in South Germany—these analyses being published respectively in the *Annales Soc. Ent. de France*, in the *Stettin. Ent. Zeit.*, and in the *Wien. Ent. Monat.*

From 1860 to the present year considerable advances have been made in our knowledge of the anatomy of this group. Olfers in his Inaugural Thesis, published in July, 1862, led the way, soon to be followed (1862) by Sir John Lubbock, whose first and second contributions to the history of the Thysanura were published together in part 3 of vol. xxiii. of the *Transactions of the Linnean Society*.

In 1864 La Boulbene published his elaborate paper on the anatomy of *Lipura maritima*. This most excellent and well illustrated essay is well worthy of attentive study. In this same year appeared A. H. Haliday's memoir on *Iapyx*, to be followed in 1865 by F. Meinert's very exhaustive memoir on the Campodeae. The year 1866 produced only the description of a new blind species of *Lepisma*, by Bilimek, from the cave of Cacahuamilpa, in Mexico, and in 1868 Sir John Lubbock's third memoir was issued.

Tullberg's valuable monograph on the Lipuridae appeared in 1869, and the fourth memoir by Sir John Lubbock in 1870. Packard, moreover, published in 1869-1871 descriptions of some new American Thysanura, including a species of Campodea and a series of observations on the embryology of an American species of *Isotoma*; he seems not sufficiently to appreciate Nicolet's work. These memoirs, it may be remarked in passing, though allusion is made to the latter, are not cited in the present work; they appeared in the *Proc. Soc. of Nat. History of Boston* for 1870 and 1871.

Without pretending in this very general sketch to give much more than a comment on a list of the principal writings on this group, what has been said may suffice to show the materials so largely contributed to by the author of the monograph under notice, which lay at his disposal in the preparation of the present work; and we experienced a feeling of disappointment in finding that the work now completed does not uphold the high promise of the author's earlier investigations and descriptions. Since 1862 other duties have in great measure occupied a large portion of his time; and we regret that the Ray Society did not provide for a careful supervision of the sheets of this work during its passage through the press, as by that means many dozens—we had almost written hundreds—of perhaps trifling but still annoying errors might have been avoided. That a student should make a list of references and be unable to find one of them because they are one and all wrong is, it will surely be admitted, vexatious. Moreover, not only are the mere bibliographical references often wrong, but the quotations are in numerous cases so incomplete that they become nearly useless. Our volume opens on page 214 at *Nicoletia* Gervais. Now so little is known about this genus that we should have expected to find that all the references would be given respecting it; there is however no reference either to the time or place of the first description of the genus. Again, Nicolet's amended diagnosis ought to have been given in full, for it is not in the power of every reader to turn at once to the *Annals of the French Entomological Soc.* for 1847. It should also be remarked that it was Gervais, not Nicolet, who named the two species of this genus. On the same page we have the diagnosis of the family Iapygidae, condensed in a most unsatisfactory manner into four lines, and the description of the genus and the European species dismissed in the following page, while the correct Latin diagnosis of neither Haliday nor Meinert is followed.

Lest our calling attention to such errors of commission should seem to savour of mere fault-finding, we will not allude in passing to the mistakes of reference from the text to the plates which frequently occur, but sometimes the figures do not even correspond with the descriptions; among the Degeeridae, for example, while in the text *Isotoma* is said to have seven ocelli, plate 55, fig. 18, shows eight; and

while *Tomocerus* in the plate has six ocelli, in the text it is stated to have seven. From the want of the simplest supervision the English descriptions of the species are sometimes puzzling: in the description of *Tomocerus plumbeus* (p. 138) we fancy that for *T. plumbea* one should read *T. longicornis* in at least four instances in which the reference is made; but in the last paragraph for want of some correction we fail to make sure of the author's meaning.

The slight confusion caused in the printing of page 38 can at once be corrected by any one who has the fourth memoir of Sir John Lubbock at hand. Were we however to find fault with the printer's errors of this volume our task would never be done, as they commence with the first page of the preface, and continue as far as Mr. R. Becks' Notes on the Scales of Thysanura; these last few pages being singularly free from them. We trust we may be forgiven for calling attention to these errors, and for further hinting that some errors of omission have also struck us in the perusal of the volume: for example, although Templeton's second paper is evidently known to the author, he has omitted to give his *Lepisma niveofasciata* in the list of species of this genus; *L. thermophila* Lucas is also omitted; as well as Bilimek's *L. anophthalma* from Mexico. This latter, however, is possibly not a *Lepisma* at all.

Campodea Americana is omitted, and if *Iapyx gigas* Br., from Cyprus, is quoted, why is not the equally remarkable *L. Saussurii* Humb. from Santa Cruz? There is no reference to the American Snow Flea (*Achorutes nivicola* Fitch), though described in the Transactions of the London Entomological Society for 1851.

As subject of criticism on which opinions may fairly be divided, we would suggest that *Tomocerus niger* Bour is nothing but the young of *T. plumbea*; and we are surprised that the courageous compiler of the synonymic list of *Orchesella cincta* Linn. should have left it as an independent species. *Ptenura* Templeton should we think be quoted as a synonym of *Templetonia* Lubbock. Again, is *Tritomurus* of Frauenfeld a good genus? Type specimens alone can settle this. *T. macrocephalus* Kol. seems to be an error, but if quoted at all the entire description should have been given. Wankel's description of an unnamed species of the genus appears in the *Verh. d. Zool. Bot. Ver. Wien* for 1856, p. 467. Of *Degeeria* Nicolet, the generic characters are emended and the scaly species taken from it and placed under *Seira* Lubbock. The spring in *Degeeria* is surely erroneously represented in fig. 15, plate 55.

*Onychiurus* Ger. *Anurophorus* Nicolet and *Adeacranus* Bourlet might have been quoted as synonyms of *Lipura* Burmeister. We fail to understand what is meant in the diagnosis of this genus by "Mandibles and maxillae as usual." Some note might have been made of Kolenati giving figures of several stigmata in his *L. Kollarii*, and as so many type specimens are in the Continental museums, the general description ought certainly to be revised. The two groups of fourteen ocelli each as described by Schiödte in *L. stillicidii* are considered by Lubbock to form the post-antennal organ. As however in *L. maritima* this organ exists with ocelli, we see no grounds for supposing these ocelli in the Adelsberg Cave species to constitute a post-antennal organ; and it will be remembered that in the species of *Lipura*, so nearly allied to Schiödte's taken by the writer in the Mitchelstown Cave, these ocelli were absent. Under *Campodea staphylinus* J.O.W. there should be included, not only *Podura ambulans* Linn. Syst. Nat., but the *Lepisma minuta*, of Müller. This is hardly the place perhaps for the discussion of such purely technical questions; in touching on them, however, we have endeavoured to avoid all matters of controversy.

Few if any of the illustrious writers we have quoted have done so much good or genuine work for the Thysanura as the author of the present monograph, which will be henceforth the starting-point for all workers and writers on the subject. That his present volume is not quite perfect; that it is wanting in that aroma of fresh field work which at one time pervaded his entomological investigations, is we believe not so much his fault as our bad fortune. His past work has shown him to be not only an ardent but a philosophical writer; and it ought to have been a pleasing duty for some one to have helped him, as he in former years has so well helped others, in the small but important and tedious details of correcting the press and of tabulating synonyms.

We endorse the author's praises of Mr. Hollick's drawings; but his own accurate anatomical drawings—not too neatly copied from the plates in the *Transactions of the Linnean Society*—are those that will be most consulted by the student.

E. PERCEVAL WRIGHT.

## Notes on Scientific Work.

### Chemistry.

**Crystalline Dissociation.**—A further paper on this subject by P. A. Favre and C. A. Valsen appears in the *Compt. rend.* 77, 577.—During the solution of a salt in water a contraction of volume is known as a rule to take place; a contraction of the salt as well as of the solvent. Its extent is easily ascertained by comparing the density of the saline solution with that of the salt and of the liquid. As now a diminution of volume may be produced in other ways, by cooling, by the withdrawal of a certain quantity of heat, we are able to determine the amount of heat corresponding to a certain contraction of the water and the mechanical effect of which it is the equivalent. When it is allowed that the different forces which are able to produce the same effect are equivalent it follows that in a determination of the contraction of volume by the solution of a salt we have a measure of the coercive force exerted by the salt on the water. The authors have already made use of this principle in their investigation on the solubility of sodium sulphate in water. They have now extended it to a number of other salts, in the accurate determination of the densities of which they experienced great difficulties, especially in the case of the iodides which act upon turpentine. As regards this contraction they found these salts to arrange themselves in the following ascending order: borates, carbonates, sulphates, chlorides, nitrates, bromides, iodides. The contraction produced by an anhydrous salt is greater than that of a hydrated salt; calcium chloride, it may be mentioned, is the only salt which exhibits no marked difference in its two forms. The contraction attending the solution of a hydrated salt is usually less than that arising from the separation of crystals. The amounts of heat given in some of the tables of this paper, and corresponding to the contraction, far exceed those noted by the calorimeter; the same difference was noticed before in the case of sodium sulphate. This arises from the fact that the quantity of heat produced by the contraction of the water during the act of solution is not evolved, as in spontaneous cooling, as sensible heat, but is often completely absorbed by the salt that is dissociated and becomes latent. The temperature indicated by the calorimeter then is the difference, often with a negative sign, between the thermo-positive phenomenon of the contraction of the water and the thermo-negative phenomenon of the dissociation of the constituents of the salt.

**Chloro-vanadates.**—A paper on these compounds by Hautefeuille has appeared in the *Compt. rend.* 77, 896. Vanadinite may be artificially prepared by fusing vanadic acid with lead oxide and an excess of lead chloride at a red heat. On removing the excess of lead chloride the vanadinite remains in yellow transparent crystals. The number of vanadates that combine when fused with chlorides is not great. Magnesium chloride gives vanadium chloride and magnesia; the latter is said to be in a crystallised condition. Calcium chloride when fused with the acid gives a chloro-vanadate. When such a fused mass is treated with water there remain crystals with an adamantine lustre, the composition of which is vanadic acid 39.07, lime 36.66, calcium chloride 23.75. This compound corresponds to wagnerite in so far that it contains similar equivalents of vanadate and chloride.

**A New Alkaloid from Morphia.**—The new substance has been prepared by G. Nadler by the action of an ammoniacal solution of cupric oxide on morphia (*Schweiz. Wochenschrift* xi, 12). Its chloride is of a brilliant white and is easily soluble in hot water, from which ammonia throws down an amorphous precipitate, that remains unchanged in the air in the moist state. With concentrated sulphuric acid it strikes an

intense green colour. From the potash solution when boiled the alkaloid separates in scales having the lustre of silver. It is moreover distinguished from morphia by the trifling solubility of its sulphate, and from apomorphia by its stability in moist air.

**Podocarpinic Acid.**—This name has been given by A. C. Oudemans to a new acid, allied to the resins, which occurs in the wood of the *Podocarpus cupressina* var. *imbricata*, from Java (*Ber. Deut. Chem. Gesell. Berlin*, 6, 1122). It forms rhombic crystals that are insoluble in water, and almost insoluble in benzol, chloroform or carbon disulphide, but which are easily dissolved in alcohol, ether, or acetic acid. They melt at 187° and are decomposed at 300°. The composition of this substance is  $C_{17}H_{23}O_3$ . It is monobasic, but gives two different series of metallic salts. Nitro- and sulpho-derivates, as well as others formed with ethyl and acetyl, have been prepared.

**Chromium Dioxide.**—Hintz has found (*Annalen der Chemie*, 169, 367) that the best method of forming this body is that recommended by Schweitzer, of passing nitrogen dioxide through a moderately dilute solution of potassium bichromate. The hydrate thus obtained when dried at 250° has a constant weight. The anhydride is a very intense black powder and is extremely hygroscopic; the hydrate on the other hand has a dull reddish brown colour, that ascribed by Vauquelin to the anhydride. When the black oxide is treated with chlorine, or what is better, hydrochloric acid, the temperature slowly rises to 250° and there is formed chromium oxychloride, some of which undergoes decomposition, forming chromium chloro-chromate  $Cr_3O_8Cl_2$ . Dry hydrochloric acid gas when allowed to come in contact with chromium dioxide forms water, chlorine, and green chromium oxide, and by a later decomposition of the last-mentioned oxide, violet chromium chloride. Phosphorus chlorides appear to have scarcely any action on the black dioxide, which in its very inactive characters bears a marked contrast to the corresponding oxide of molybdenum. Whether it is a peroxide proper,  $CrO_2$ , or a basic chromate of chromic acid,  $Cr_2O_3 \cdot CrO_3$ , has yet to be determined.

**The Decomposition of Metallic Sulphides.**—It has been noticed by E. Jannettaz (*Compt. rend.* 77, 838) that potassium bisulphate when rubbed together with pounded galena causes a brisk evolution of sulphuretted hydrogen. Sulphuric acid, on the other hand, exercises no action on the powdered mineral even when heated with it. Zinc sulphide exhibits the same reaction though in a less degree. The sulphur compounds of antimony, iron, mercury, and silver are quite indifferent, as are also those minerals in which lead and sulphur occur in combination with other sulphides.

**Coptine.**—E. Z. Gross, who has recently examined *Coptis trifolia* (*Helleborus trifolius*, Linné) finds it to contain, in addition to berberine, a new alkaloid which he has named coptine (*Amer. Jour. Pharm.* xiv, 193). It differs from berberine in being colourless, in giving a precipitate with potassium-mercury iodide, and in dissolving in cold sulphuric acid without undergoing change.

**A New Quinine Hydrate.**—It has been found by A. C. Oudemans (*Ber. Deut. Chem. Gesell. Berlin*, vi, 1165) that in addition to the two already known hydrates of quinine there exists a third containing nine molecules of water,  $C_{20}H_{24}N_2O_9 \cdot 9H_2O$ . It is amorphous and does not differ in appearance from that containing three molecules of water.

**Mineralogical Notices.**—In continuation of former papers bearing this title, a paper was communicated to the Chemical Society on the 4th instant by N. S. Maskelyne and W. Flight on the crystallographic and chemical characters of caledonite and on lanarkite. Some specimens from Leadhills, recently procured for the British Museum, having been found on analysis to have a composition differing from that of caledonite, a specimen of true caledonite was also examined, and while neither analysis accorded with that of Brooke both agreed in showing this mineral to be lead sulphate in combination with lead hydrate and copper hydrate. Lanarkite was found to contain no water and to be a compound of lead sulphate and lead oxide, as Pisani has shown.

Prof. A. W. Williamson, President of the British Association, has been elected Foreign Secretary of the Royal Society, and a Corresponding Member of the Academy of Sciences.

### Botany.

**The Source of Nitrogen in the Food of Plants.**—In the *Annales des Sciences naturelles* for September M. Dehérain discusses this subject from a somewhat novel point of view. While adopting the conclusions of Lawes and Gilbert, Ville, and Boussingault, that plants have no power of absorbing nitrogen directly from the air, he still holds that the atmospheric nitrogen is the source of that which enters into the composition of the tissues of the plant. The results of a series of investigations which M. Dehérain has carried out tend to show that atmospheric nitrogen is fixed and retained in the soil through the medium of the hydrocarbons such as humus, in conjunction with alkalies, and that this fixation is favoured by the absence of oxygen. In other words, the fixation of atmospheric nitrogen occurs when organic materials are in process of

decomposition in an atmosphere either deprived of oxygen or in which that element is deficient. Under these circumstances carbonic acid and hydrogen are both given off, the latter uniting with nitrogen to form ammonia. According to the earlier researches of Thenard there are in soil two strata exposed to the action of the atmosphere—an upper oxidising and a lower deoxidising stratum. In the first stratum the nitrogen is obtained from the atmosphere, and impregnates the subjacent soil around the roots; in the second the nitrogenous compounds are converted into insoluble humates. The air of the soil is therefore at a certain depth deprived of oxygen; hydrogen is produced as the result of the decomposition of organic substances; and this hydrogen unites with the nitrogen to form ammonia. If these views are correct, they will have a considerable practical importance in agriculture, the value of a manure depending not so much on the actual amount of nitrogen present in it as on the quantity of carbonaceous substances which possess the power of taking up nitrogen from the atmosphere.

**Irritability of the Sensitive Parts of Plants.**—M. E. Heckel, in the *Comptes Rendus* for 27th October, points out the importance of the two kinds of irritability in plants first described by M. Bert—the one spontaneous, the other incited. The Sensitive-plant, *Mimosa pudica*, on which M. Bert chiefly experimented with a view to test the influence of anaesthetics on these phenomena, is however subject to the disadvantage of combining these two kinds of irritability. M. Heckel experimented instead on the stamens of *Mahonia*, in which the only motion is one resulting directly from irritation, and in which there is no spontaneous sensibility. On exposing these to the action of chloroform he found the irritability to be at once entirely destroyed. The stamens of *Ruta graveolens* present the converse phenomenon of an automatic sensitiveness, but with no irritability, their motion being caused by forces independent of direct excitation. Exposed to chloroform, they underwent no change whatever. He concludes that incited (irritable) movements have a special determination belonging to functional irritability; while spontaneous (sensitive) motions belong to the general life of the plant and may be described as a nutritive irritability.

### Geology.

**The Igneous Rocks of Styria.**—Dr. R. von Drasche describes in *Mineralogische Mittheilungen*, 1873, part 1, the mineral constitution of some of the igneous rocks of Styria. The highest peak of the Smrkouz Mountains consists of andesite which, when examined in thin sections, presents a mass of crystals of plagioclase with a clear green mineral of distinct outline that he considers to be diallage; the ground-mass is a structureless serpentine-like substance enclosing plagioclase crystals in large quantity. Hornblende-augite-andesite occurs in numerous bands and veins in the tuff of Osloberg, south of the Smrkouz Mountains. The hornblende crystals have a blackish-green colour and are about three mm. long, the augite occasionally resembling diallage. A much altered andesite is found at Sagai on the southern slope of the Wotsch Mountains. The plagioclase crystals here attain a length of four mm., are greenish in colour, and have no action on polarised light. They are disposed in a green amorphous ground-mass resulting from the decomposition of augite and hornblende, which contains much magnetite and copper pyrites. At Videna, near Rohitsch, is found a compact dark-brown to black augite-andesite. A thin section shows much plagioclase in small crystals with well defined crystals of augite in a fine grained ground-mass. It also encloses long crystals of a somewhat metallic lustre, with distinct cleavages parallel to their larger dimension. Perpendicular to this direction it is much fractured; it is quite infusible before the blowpipe. Its optical properties prove it to belong to the rhombic system and Drasche regards it as bastite. In the tuff district near Wöllan rises a small hill consisting of a quartz-hornblende-andesite. The felspars here are plagioclase with a little orthoclase; the quartz crystals are much fractured, the interstices being filled with the fine-grained ground-mass; the hornblende is in very distinct crystals, and a little magnesian mica accompanies them. At Tüffer two varieties of a "hornstone trachyte" are met with, one red in colour, possessing considerable hardness and splintery fracture and enclosing occasionally some small crystals of orthoclase felspar; the other a green variety, also very compact, and somewhat resembling petrosilex; this under the microscope exhibits spots of a greenish hornblende or chloritic mineral. Between St. Georgen and Monpreis rises a chain of hills which consist of a much weathered rock of a light reddish colour presenting in its fresh condition a felsitic appearance; it consists of a felspar, the species of which is quite unrecognisable in consequence of its being much weathered, and quartz in crystals, and is penetrated by numerous small veins of the latter mineral. All of these rocks, formerly considered to be of triassic age, are shown by von Drasche to belong to the tertiary period.

**Diallage in Quartz Porphyry.**—Diallage, formerly regarded as a peculiarly essential constituent of gabbro, has been found to constitute an important part of some melaphyres, as well as picrite and andesite. It is now observed (*Mineralogische Mittheilungen*, 1873, part 1, p. 47) to be an essential ingredient of a quartz porphyry from Crasdorf quarry,

near Taucha, east of Leipzig. By an examination of microscopic sections the large felspar crystals prove to be orthoclase, the smaller plagioclase. The quartz is in grains, most of them rounded or of very irregular outline, and only rarely in crystals. The diallage occurs in short green prisms with sharp outline, only slightly dichroic, the colour ranging between yellowish-green and emerald-green, and is much less abundant than the plagioclase. This rock does not correspond with the normal type of the quartz-porphyrus, but is intermediate between them and the palatinit.

**A New Fossil Lemur from the Phosphate Beds of Quercy.**—M. H. Filhol points out, in a note to the French Academy of Sciences (*Comptes Rendus*, 1873, No. 19, vol. 77, p. 1111), the more important peculiarities of the cranium of another new genus of the family Lemuridae, lately found in the phosphate beds of Quercy. The interorbital space is wide and differs much from that of the *Lori*. The orbits are large and indicate an animal of nocturnal habits; the temporal crests are united posteriorly to the frontal, while in the *Nycticebus* they are directed backwards without being united. The teeth are not so sharp as those of the *Lori* and the first premolar of the upper jaw is far less developed. The molars bear a great resemblance to those of the *Galago*, but in that genus there is an interval between the first and second upper premolars, and the first upper premolar is very stout and presents the aspect of a canine, neither of which peculiarities is noticed in this fossil. The form of the lower maxillary is the same as that of *Galago*; and the tympanic bone is also similarly developed. This fossil, to which M. Filhol assigns the name of *Necrolemur antiquus*, is closely allied to the *Galago*, though it also presents some affinities with the *Lori*.

**The Quartz-bearing Andesites of Transylvania and Hungary.**—Dr. C. Doelter describes the results of his examination of 200 hand specimens and 90 sections of the Dacites or Quartz-bearing Andesites of Hungary and Transylvania. These rocks essentially consist of plagioclase, sanidine, quartz, hornblende, augite, biotite, magnetite and apatite; the accessory minerals are epidote, chlorite, pinitoid and pyrites. Nepheline and tridymite have not yet been observed in them. The plagioclase is of very variable composition, corresponding for the most part with andesite, but is sometimes to be referred to labradorite. From 53 to 60 per cent. of the mass consists of plagioclase. Sanidine is a constant constituent, but varies considerably in amount: in a few cases it forms a third part of the whole felspar contents, but the plagioclase is frequently present in the proportion of from five to six to one of orthoclase. Quartz also varies greatly in quantity, and occurs either as rounded grains or crystals. Hornblende is usually in larger quantity than augite, and biotite is always present. These rocks are all very much decomposed, some of them being converted into a white friable chalk-like mass, enclosing quartz; those at Vöröspatak, Boicza, and Rodna being specially remarkable for the amount of gold they contain. The Dacites have a very limited distribution, the principal districts being the Vlegyasza-gebirge and the Siebengebirge. (*Mineralogische Mittheilungen*, 1873, part 2, p. 51.)

## History.

CLASON'S Continuation of Schwegler's History of Rome. [*A. Schwegler's Römische Geschichte, fortgeführt von Octavius Clason, erste Lieferung.*] Berlin: Calvary. 1873.

CLASON naturally begins his book with a summary of the results obtained by Nitsch, Nissen, and others, as to the authorities employed by Livy and Dionysius. The theory is that there were three main sources, Fabius Pictor, Valerius Antias, and Licinius Macer, and that Livy used all three, Dionysius only the two latter. Livy seems to use only one source at a time, Fabius Pictor down to 2.21, then to 3.5 alternating between Fabius and Valerius, while subsequently Macer is employed, who gave the cognomina of the magistrates, &c. The cognomina are a great test. Thus they are surprisingly frequent in Dionysius 5-9, while rare in the corresponding parts of Livy; reversely they are

frequent in Livy 3.6-4.7, and very rare in the corresponding part of Dionysius. It is obvious how valuable this inquiry is for the early Roman history, and this section of Clason's book is clear and good. He has barely begun the historical section of the work, on the events from the burning of the City by the Gauls to the struggle for the Licinian Laws. His chief contribution to the criticism of the history is a suggestion that the Roman statement about the Æquian and Volscian wars, viz. that the advancing Oscan tribes during sixty years conquered many Latin and Hernican towns, and that then the Roman confederacy re-conquered these places, such as Tibur and Praeneste, during the next sixty years (after the Decemvirate), was a Roman fiction to excuse the attack on the Æqui and Volsci; that the places conquered were originally Oscan, and only became Latin in consequence of the conquest. The view does not seem to be important, and contradicts not merely the historical account, but the traditions as to the founders of these places collected by Cato and other writers. It is true indeed that these traditions may not be of much value, but Clason sets a mere guess against them. Perhaps the tendency now is a little too much on the side of supposing that the later history of the Republic has thrown a colouring back over all early events. C. de Boor's valuable *Fasti Censorii* have lately shown that Mommsen is somewhat inaccurate in his account of the censorship. Mommsen thinks that the period of five years was assigned to the office in its earliest form, because five years was the period towards the end of the Republic; but de Boor shows from Cicero (*Ad Attic.* i. 18. 8, 4. 16. 14) that the censors then only held office for a year and a half. De Boor also shows that Schwegler's view of the fourth tribune (in the years when there are four military tribunes instead of three) exercising the censorial powers is untenable. C. W. BOASE.

Forbiger's *Hellas and Rome.* [*Hellas und Rom. Populäre Darstellung des öffentlichen und häuslichen Lebens der Griechen und Römer, von Dr. Albert Forbiger. Erste Abtheilung. Rom im Zeitalter der Antonine.*] Leipzig: Fues. 1871. 2 vols.

THE idea of illustrating the private life of the ancient nations by a fictitious narrative, which shall as it were give us admission to the domestic scenes, the every-day pursuits and lighter occupations of the two leading races of antiquity, whose external history we are in the habit of studying with such close attention, is not new. Possibly Montesquieu may have set the fashion in his *Lettres Persanes* in 1721, but his visitor was more of a Parisian than a Persian, and Goldsmith and other English Essayists, following his example, used their foreign travellers chiefly as a means of satirising the manners and views of their own age. Perhaps the first work of this kind which was really meant to illustrate ancient life was the *Athenian Letters*, to which Charles Yorke was the principal contributor, published at Cambridge in 1740. Cleander, an agent of the King of Persia, is supposed to be resident at Athens during the Peloponnesian war, and to carry on a correspondence, not only with his court, but with his brother living at home, and with private friends in Egypt and other provinces of the Persian Empire (see some extracts in Campbell's *Lives of the Chancellors*). Then we had the Abbé Barthélemy *Travels of Anacharsis*; and in more modern times Bulwer's *Last Days of Pompeii*, Lockhart's *Valerius*, the *Letters from Palmyra*, and other similar works have shown that a successful attempt to reproduce the life of the classical ages would be welcome. It remained for the Germans to attempt to combine the fictitious elements of a story with a series of appendices or short treatises which serve to condense the

mass of separate works in Graevius' *Antiquities*, "De re vestiaria," &c., into a more comprehensible form, while correcting and adding to them from the inscriptions and works of art since discovered. To this idea we owe Böttiger's *Sabina, or Morning Scenes at the Toilette of a rich Roman Lady*; and, above all, Becker's *Charicles and Gallus*, which represent to us Athens in the first period of the Macedonian supremacy, and Rome in the age of Augustus; both have been translated by Mr. Metcalfe. Dr. Forbiger in his present work intends to illustrate the middle age of the Empire, reserving his picture of Greek life for a later work, on the ground that modern readers are more interested in the culture and manner of life during a period so much nearer to us, and so much more closely resembling our own in its spirit and tone. He therefore gives us a journal of a Greek who travels to Rome in the time of Marcus Aurelius, and is promoted through the influence of kind friends to be a sort of cabinet secretary to the Emperor, with the function of reporting on the despatches from Greece and the East—there being a separate "procurator ab epistulis latinis." The first volume is taken up with the journey to Rome and the sights he saw there, while the second describes his official career and experiences. The author seems to feel that the mask is not very well kept on, and that the modern German is very visible through his Greek disguise; in such sections as that on the origin of the Roman religion we have a modern view, not an ancient. The book therefore essentially contains first a series of chapters written for the general public, and then a series of appendices intended for the more learned and critical student, the references to the notes of more general interest being pointed out to the former by thicker figures, while the indices make the whole work easy of consultation. The book is meant to be the closing work of Dr. Forbiger's literary efforts during the past half century, and he has accumulated a great mass of information in a very readable form. Still we cannot but feel that the double shape of the book is somewhat unfortunate, for the narrative part is not so lively as Becker's two stories (if the word "lively" can be used at all in such a connexion); and, when both text and appendix are so learned, it seems a pity to separate them and so cause a certain amount of repetition, while the turning backward and forward to look at the notes of course gives trouble. On the whole we much prefer the plan of such a book as Friedländer's *Sittengeschichte Roms*, where the whole description runs on smoothly and the notes are at the bottom of the page, only some discussions on literary or chronological points being reserved for separate consideration in appendices. This however is perhaps a matter of taste, and Dr. Forbiger's Greek friend is an interesting guide in our walks about Rome. He landed at Brundisium, and, after having his luggage examined by the custom-house officers, hired a carriage to take him to Rome. There his friend Sulpicius sends round a Greek freedman, Narcissus, to show him the sights, and hence we get a description of the streets, markets, baths, slave marts, &c., while Sulpicius' own house and household both in town and country are also described at length, and a sketch of Roman family life given. Of course our traveller is taken to see the theatre and circus games, and with them his leisurely tours of inspection come to an end, for at the beginning of the second volume he is employed in his public functions. This gives him an opportunity of describing the bureaucracy, the Emperor's triumph, the "Consecration" of Verus, the Emperor's adoptive brother; and this again leads to the question about the nature and influence of Roman religion, the state of art and science, and the condition of the industrial arts; and these last chapters are perhaps the most interesting part of

the whole. The free trade which prevailed throughout the Empire, and which modern Europe has not yet succeeded in restoring to anything like the same extent, allowed of a much greater concentration of all available materials for great works of architecture and art, while artists and artisans of all kinds were easily brought together. Hadrian's journeys of inspection through the Empire, accompanied as he was by a large staff of engineers, led to great public improvements. The reign of Marcus Aurelius is rightly selected by Dr. Forbiger as the point of time at which to describe the Empire, for after it art rapidly declined. Niebuhr has attributed the change to the dreadful plague, which Verus' army brought back, after conquering Seleucia from the Parthians. "The plague at Athens in the beginning of the Peloponnesian war forms a similar turning-point in the history of Attica; the Black Death in the year 1348 put a complete stop to early German literature, and the literature of Florence was manifestly affected in the same way. The ancient world never recovered from the blow inflicted upon it by the plague which visited it in the reign of Marcus Aurelius."

C. W. BOASE.

Unpublished Letters of Napoleon. [*Ungedruckte Briefe Napoleons aus den Jahren 1796 und 1797 im Besitze des Haus-Hof- und Staats-Archives in Wien.*] Von Dr. Hermann Hüffer. Wien: Gerold's Sohn.

DR. HÜFFER introduces these letters with an interesting sketch of the editions of Napoleon's correspondence hitherto published. Nothing gives us so vivid an impression of the great Emperor's personality as his letters; they will always be the chief authority for his history. A German professor at Würzburg, Fischer, was the first to publish a collection of them in 1808. Napoleon had himself taken great pains to keep copies of his correspondence, and from these MSS. the *Correspondance inédite* was published at Paris in seven volumes in 1819. It contained very many also of the letters sent to him, thus out of 744 pieces relating to the Italian campaign of 1796-7, only 250 are from Napoleon himself. The new collection, in twenty-eight volumes, published by a commission appointed by Napoleon III. in 1854, is very full in the early parts, but complaints have been made of suppressions in the later volumes. The principle of publishing only "what the Emperor would himself wish to make public if he were still alive" naturally led to some unfavourable parts of the correspondence being omitted; for instance, as d'Haussonville has pointed out, much of what concerns Napoleon's treatment of the Pope. Lanfrey makes similar complaints about political matters. The letters which Dr. Hüffer has extracted from the Austrian Record Office date from the summer of 1797, when Bonaparte was negotiating with Austria at Montebello, near Milan, the only time he acted in person as a diplomatist. The Austrian minister Thugut tried to protract the negotiations, and refused to ratify the preliminaries signed by his ambassadors. Bonaparte's first letter expresses his surprise at this want of good faith; and several despatches follow on small points. A letter to the Elector of Bavaria requests him to pay the war contribution which his ministers had promised to Moreau, but which he did not pay when fortune turned and Moreau had made his famous retreat through the Black Forest. At last the French plenipotentiaries sent an ultimatum to Vienna, and the Emperor made up his mind to empower Count Cobenzl to make peace in earnest. Even then the ambassadors could not agree, and Bonaparte sends a letter to the Austrian general in order to settle how to give due notice of resuming hostilities. The demand of the Ionian Islands for France seemed to destroy the last chance of peace, but Cobenzl now gave in.

Dr. Hüffer concludes his valuable pamphlet by pointing out some other letters, printed and unprinted, which have come under his notice in the course of his researches.

### Notes and Intelligence.

*Verfassung und Demokratie der Vereinigten Staaten von Amerika von Dr. H. v. Holst, a. ö. Professor an der Universität Strassburg.* 1. Theil: *Staatsentwerfung und Sklaverei* (Düsseldorf, 1873), is the first instalment of a probably extensive work on the constitutional politics of the United States. Its arrangement resembles in certain respects the writings of R. Gneist on administration and self-government in England. The author explains in the preface why he had to enlarge his original plan, a mere description of the present working of the constitution, by going back into the history of the constitutional law of the Union. He has done so most conscientiously, since the sifting of an enormous mass of printed matter was indispensable, before an impartial view of the historical development as well as of the opposing forces could have been obtained. By grappling with the mighty questions of state, and entering largely into their details, he introduces his readers to a vast amount of transatlantic official and party literature, only the smallest part of which has hitherto been noticed by European authors. Another storehouse is thus opened to the student of constitutional law and comparative politics in general. This first volume, however, furnishes mainly the internal history of the Union from its origin down to the compromise of 1833. Its component parts treat successively of the continuous struggles between confederate and federal principles, that of state-right and of central power. We have chapters about the Virginia and Kentucky resolutions, the presidential election in 1801 and Jefferson's policy, Madison and the second war with England, a history of slavery and of the abolition movement since 1789, of the doctrine of nullification, in fact of all the different phases of reaction against unity of legislation and executive government. Certainly a book like this could never have been written by an American. It will be the more interesting to observe by and by the reception accorded to it on the other side of the Atlantic.

Within the last few months three great collections of documents referring to the early history of certain North German cities, which were formerly important members of the Hanseatic league, have considerably advanced. Besides their municipal value, these works supply the sources for the study of civic law, of federal tendencies and commercial policy during the Middle Ages. Every one of these cities moreover appears to have had early intercourse with England, and many new documents bearing on this point are now printed for the first time. We mean: 1. *Codex Lubecensis, Urkundenbuch der Stadt Lübeck*, vol. iv., 1873, the continuation of a work begun thirty years ago, containing chiefly charters, statutes, and similar materials of the fourteenth century down to 1400; 2. *Bremisches Urkundenbuch im Auftrage des Senats der freien Hansestadt Bremen herausgegeben von D. R. Ehmck und W. v. Bippen*, vol. i., 1873, with the documents of this city down to 1300; 3. *Urkundenbuch der Stadt Braunschweig*. Vol. i.: *Statute und Rechtsbriefe 1297-1671 im Auftrage der Stadtbehörden herausgegeben von Ludwig Hänselmann, Stadtschreiber*, 1873.

A very valuable paper on Arnold of Brescia by W. v. Giesebrecht is printed in *Sitzungsberichte der philosophisch-philologischen und historischen Classe der k. b. Akademie der Wissenschaften zu München*, 1873, Heft i., p. 122. The learned historian communicates his discovery that the *Historia Pontificalis*, an original narrative of the twelfth century, printed for the first time from a MS. at Bern in Pertz *Scriptores*, vol. xx., p. 517, and giving a curious account of the life and times of Arnold, similar in many respects to that preserved in the *Gesta Friderici I.* by Bishop Otto of Freising, is the work of no less a contemporary than our own John of Salisbury.

The fourth number of the *History of the Franco-German War*, composed by the Prussian staff under the superintendence of Count Moltke, deals with no more than eight days, from August 7 to August 14, describing minutely the advance of the German armies toward the Moselle, the activity of their divisions of cavalry, and the battle fought on the 14th east of Metz, now called officially that of Colombey-Nouilly. A very extensive and most accurate plan is added to the text.

### Contents of the Journals.

*Literarisches Centralblatt*, Sept. 20, praises Schiller's *Geschichte des römischen Kaiserreichs unter der Regierung des Nero* (though blaming the tone of contempt for the opposition to the Emperors, of which Adolf Stahr set the example); and Flathe's *History of Saxony from 1806 to 1866*.—A notice of Arnold Schaefer's *Essays* mentions the proof that the supposed treaty of 11th Jan., 1757, between England and Prussia is spurious.—Sept. 27 analyses Nohlmann's and Baumbach's *Lives of Arnold von Selenhofen*, Archbishop of Mainz 1153-60 (these

archbishops were always important owing to their double position, as Metropolitans and Archchancellors of Germany); and praises two excellent manuals, Wattenbach's *Deutschland's Geschichtsquellen im Mittelalter*, and Richter's *Annalen der deutschen Geschichte im Mittelalter*.—Oct. 4 sums up the controversy on the unfortunate first volume of the *Diplomata Imperii* by the younger Pertz, and notices Meyer's edition of Radewic's (perhaps the continuer of Otto of Freising) poem on Theophilus, one of the three forms in which the story of a compact with Satan appears, the other two being the legends of Anthemus, and of the servant of Proterius—the last was admirably versified by Southey, under the title of "All for love, or a sinner well saved."—Oct. 11 reviews Adolf Beer's instructive book on the First Partition of Poland, and San-Marte's translation of Wolfram von Eschenbach's Middle-high-German poem *Wilhelm von Orange*, in which the German writer surpassed the *Chanson de geste* which he copied.—Oct. 13 notices A. de Boor's *Fasti Censorii*, Krones' *Die österreichische Chronik Jacob Unrest's*, Hänselmann's *Urkundenbuch der Stadt Braunschweig*, Walther's *Die grosse Landgräfin Caroline von Hessen*, and Brandes' excellent *Lectures on Die Hauptströmungen der Literatur des neunzehnten Jahrhunderts*—which has just been reviewed in the *Revue des deux Mondes* at length.—Oct. 25 discusses Bayer's book on Aeneas Sylvius' *Historia Friderici III. Imperatoris*—a work still important; and the second part of Philippson's *Heinrich IV. und Philipp III., die Begründung des französischen Übergewichts in Europa 1598-1610*.—Wolzogen's translation of our famous Anglo-Saxon poem *Beowulf* is strongly commended.

*Bullettino dell' Instituto di Corrispondenza Archeologica*, Aug. and Sept., continues the account of the excavations at Capua and Chiusi, the latter supplying some small Etruscan inscriptions.—Some Laconian inscriptions follow, and a review is given of Benndorf's excellent work on the Metopes of Selinus.—Oct. describes the opening of twenty-five tombs at Ligurno, where many interesting objects were found, but no inscription.—Some more inscriptions from the Peloponnese follow, one of them written *boustrophedon*.—The discussion is continued on the name of the Roman colony in Africa, Tubusuctus, which Pliny calls Tubusuptus, and Tacitus Tubuscus; the discovery of an inscription has settled both the name and the locality.

*Altpreussische Monatsschrift, neue Folge. Der neuen preussischen Provinzialblätter vierte Folge.* July-Sept.—Boldt describes the contest between the Teutonic Order and the Lithuanians 1370-86, just before the marriage of the Lithuanian duke Jagellon with the heiress of Poland led to a concentration of hostile force, before which the Order gave way.—A description of an early round shield from the iron age follows, such as horsemen held in the left hand to parry blows, while the long shield was the foot-soldier's defence.—Rossberg prints the old Town-regulations of Saalfeld, as confirmed by Albert Margrave of Brandenburg in 1560; the arrangement is according to the penalties, given in schillings.—At the end of the number some original documents are printed, including a letter from Duke Julius of Brunswick to Albert Frederic of Prussia; one (in German) of Hochmeister Winrich von Kniprode in 1381 speaks of a successful campaign in Lithuania.

## Philology.

The *Electra* of Sophocles. The Greek Text critically revised, with the aid of MSS. newly collated, and explained. By Rev. F. H. M. Blaydes, M.A. Williams and Norgate.

MR. BLAYDES' *Electra* of Sophocles differs not much in plan from his edition of the other plays. A superfluity of notes, and a restless desire to alter the text in numerous passages which appear to sober scholars perfectly sound, are the

general characteristics of this work, on which, it is evident, a great deal of thought and research has been bestowed. But Mr. Blaydes' poetical judgment seems sadly at fault; a scholar who still insists that such an alteration as that in *Oed. R.* 420,

βοῆς δὲ τῆς σῆς ποῖος οὐκ ἔσται ἑλικῶν (sic)

(i.e. ποῖος ἑλικῶν), for ποῖος οὐκ ἔσται λιμῶν, is likely "to find favour among those who are best qualified to judge," or who is content with such a reading in *Electr.* 21 as ὦν ἐσμέν γ' ἵνα for ὡς ἐνταῦθ' ἐμέν, and labours to defend the intolerable γε by two or three passages of an utterly different character, is not a safe guide in the art of classical criticism. If there is a verse in Sophocles, one would think, clear and unobjectionable, it is *El.* 27-8,

ὡσαύτως δὲ σὺ

ἡμᾶς τ' ὀτρύνεις καὶ τοὺς ἐν πρώτοις ἔπει.

"Thus you not only exhort and encourage us, but are among the first to accompany us."

The comment of the scholiast and the reading of one MS. show that there was an ancient variant, ἔση for ἔπη. Mr. Blaydes' note is as follows:—

"πᾶρει conj. P. Leopard. ἐν πρώτοις αἰ (or ἐν πρώτοις εἴ' εἰ) conj. Nauck. Qu. πρόει, or ὑπεί (gl. πρόει, as we find ὑπάγειν explained by προάγειν, and ὑπάδειν by προάδειν). Or πέλει. Or ἄγειν. Or ἡμᾶς ὀτρύνεις αὐτοὺς ἐν πρώτοις αἰ (or φανεῖς, or ἰών, or ἐν πρώτοις αἰών). Schol. ἔπη. πρώτος ἔσθ' διὰ τὴν ἀπὸ τοῦ γήρως εὐβουλίαν." Now, ὑπεί and πρόει (to say nothing of the strange forms) could not occur as *present* tenses in the early Attic of Sophocles, in which εἶμι always has a future sense, as μέτει in 430.

A more useful remark would have been, that this scholium shows, as many scholiasts' glosses do, that the scholia and the text were taken at some period of transcription from different MSS. This remark applies throughout to the scholia in the Medicean Aeschylus.

To revert briefly to the former passage (21), not only the epic form ἐμέν for ἐσμέν, but the rare dual of the second person of the imperative, ξυνάπτετον, go far to show that this and the preceding verses are interpolations. The original text was probably this:

μέλαινα τ' ἄστρον ἐκλείπειν εὐφρόνην

ὥστ' οὐκέτ' ὀκνεῖν καιρὸς, ἀλλ' ἔργων ἀκμή.

"The sable night has not a star left in the sky; so that 'tis no longer time for delay, but the moment for action."

The construction ἄστρον ἐκλείπειν is peculiar, but appears to represent ἐλλιπὴς or ἐκλιπὴς ἔστιν. Mr. Blaydes' guesses, μέλαινα τ' ἄστρ' ἤδη λείπειν εὐφρόνην, and μέλαινα τ' ἄστερ' ὦψ λείπειν εὐφρόνην, are most unrhymical.

Another instance of interpolation is in *El.* 690-5, where the verses, full of faults as they are, both metrical and grammatical, were apparently introduced for the sake of the name Ὀρέστης. The last verse,

τοῦ τὸ κλεινὸν Ἑλλάδος

Ἀγαμέμνονος στρατέμ' ἀγέραντός ποτε,

seems made up feebly from the first verse of the play,

ὦ τοῦ στρατηγήσαντος ἐν Τροίᾳ ποτὲ

Ἀγαμέμνονος παῖ.

Mr. Blaydes adopts Porson's (or Blomfield's) emendation, ἀθλ' ἄπερ νομίζεται, for πεντάεθλ' ἂν νομίζεται. But this is a wrong use of the specific ἄπερ. It should have been ἀ εἴη.

Another interpolation (probably), though one less obvious, is ver. 904, in which τοῦθ' ὄραν τεκμήριον comes very awkwardly after the *mental* sight of her brother suggested to Electra by the lock of hair she had found. The reading anciently was, it may be conjectured,

ἐμπαιεῖ τί μοι

ψυχῇ ξύνηθες ὄμμα φιλάτου βροτῶν,

"There suddenly strikes on my soul the familiar aspect of one most dear to me of living men."

Again to bring in the name of her brother some interpolator added,

πάντων Ὀρέστου τοῦθ' ὄραν τεκμήριον.

An example of an alteration which can be shown to be almost certainly wrong is Mr. Blaydes' substitution of λέβητι for μέγιστον in 758,

καὶ νῦν (νῦν?) πυρᾷ κέαντες εὐθὺς ἐν βραχεὶ  
χαλκῷ μέγιστον σῶμα δειλάτας σποδοῦ  
φέρουσιν ἄνδρες, &c.

Mr. Blaydes chooses to read on mere conjecture ἐνθύντες βραχεὶ χαλκῷ λέβητι, which is simply a wilful corruption of the text of Sophocles. The remark in his Appendix (p. 305), "I do not think there is any antithesis intended between μέγιστον and βραχεὶ," while it suggests the suspicion of an after-thought, would hardly have been made had he remembered the exactly parallel lines in Propertius, who beautifully says in describing the grief of Briseis for Achilles (ii. 9. 9),

"Foedavitque comas, et tanti corpus Achilli  
Maximaque in parva sustulit ossa manu."

"She raised in her little hand the huge bones of her hero," i.e. pieces of the burnt bone."

In the well-known passage (780)

ὥστ' οὐτε νυκτὸς ὄππον οὐτ' ἐξ ἡμέρας  
ἐμὲ στεγάζειν ἥδυν,

without mentioning the almost certain correction ὕπνος—ἐμ' ἐστεγάζειν ἥδυν, by which the difficulty of οὐτε with an infinitive is avoided with scarcely any alteration of the words, Mr. Blaydes merely says στεγάζειν is "an unusual expression," and reads in his text ἐμοὶ πελάζειν, which he calls "highly probable." Of course, that is a matter of opinion. Can he say that ὕπνος ἐμοὶ πελάζει is a usual expression?

The difficult passage in 451, where τήνδ' ἀλίπαρὴν τρίχα is used when λιπαράν, "glossy," was rather to be expected (and where the long ι in λιπαρῆς admits of no safe explanation except that the verse was due to the blundering of an interpolator who confounded λιπαρῆς with λιπαρὸς), is dismissed by Mr. Blaydes with the following series of conjectures:—"Qu. τήνδε ἢ ἀλίπαρον τρίχιν. Or τήνδ' ἀλίπαρον δὴ τρίχα. Or τήνδε νεοκαρῇ (or νεοκαρτον) τρίχα. Or τήνδε κακοπινῇ (cf. *Aj.* 381) τρίχα. Or τήνδε πιναράν δὴ τρίχα. Or τήνδ' ἀνηλεῆ τρίχα." (My own view of this passage is given in the *Journal of Philology*, vol. v., No. 9, p. 90.)

Surely this system of firing random shots is something very different from the art of a critic. It is impossible to put any, even the slightest, faith in any one of such guesses. What possible value then can they have? So much pains and so much ingenuity would produce better results if directed by a sounder judgment and truer poetical feeling for iambic composition—a faculty that probably can only be acquired by the successful practice of verse-composition in earlier life.

F. A. PALEY.

Paul and Braune on the History of the German Language and Literature. [*Beiträge zur Geschichte der Deutschen Sprache und Literatur*, hrsg. von H. Paul und W. Braune. 1. Band. 1. Heft.] Halle: Lippert.

FIRST in place, and perhaps also in value, comes an essay by W. Braune, "Zur Kenntniss des Fränkischen und zur Hochdeutschen Lautverschiebung." He divides the Frankish dialect into three groups, Upper, Middle, and Low-Frankish. It is with the second of these groups (commonly called Niederrheinisch) that the essay is most immediately concerned. It extends, roughly speaking, from the Mosel to Düsseldorf, including Trèves, Cologne and Aix-la-Chapelle, and is characterized by the retention of the neuter ending *t* in *dat*, *wat*, &c., while otherwise *t* has been regularly "verschoben" to *z*. It is thus sharply marked off from the Upper-Frankish on the one hand, in which the *z*-change is carried out everywhere, and the Low-Frankish on the other, where the change of *t* into *z* has not been developed at all.

The proofs are drawn partly from the living dialects, partly from the older charters: it is shown that the distinctive features of the middle dialect were fully developed in the 13th century, and that it was spoken in the same localities as it is now. Braune has rendered an important service to philology by his refutation of the current hypothesis which explains the High-German forms in the Middle-German dialects as the result of the literary and social preponderance of the High-German dialects. He shows clearly that the imperfectly carried out *lautverschiebung* of the Middle-Frankish—and, to a less extent, of Frankish generally,—is quite as independent a phenomenon as the more advanced changes that characterize the Alemannic dialects. The peculiarities of Middle-Frankish are, in short, as old as the 3rd *lautverschiebung* itself. Braune agrees with Scherer in considering the change of *t*, &c., into *z*, &c., as the first and most characteristic change: he considers that the change of *th* (dh) into *d* is later and of secondary importance. We cannot follow the details of his chronological investigations, but must content ourselves with calling attention to the great clearness and precision with which he treats the phonetic side of the question, contrasting favourably with the pretentious mysticism in which many German philologists have veiled it.

The *lautverschiebung* is also treated of by H. Paul in the last essay in the volume, "Zur Lautverschiebung," but from a less objective and more conjectural point of view than Braune's. Paul starts, for instance, with the hypothesis that Gothic *h*, &c., was pronounced *v*, based on the Byzantine pronunciation of *β*, although it certainly seems rather strange that the fact of such a change having taken place in Byzantine Greek should have debarred the Goths from all means of representing the sound of hard *h*. Runic are much more probable than Greek analogies in such cases. A great part of the essay is taken up in adducing cases in support of the change of (v) &c. into the corresponding stops, a change, which it seems, is still looked upon with distrust in Germany. All this is good and sound. So also is the proof of the untenability of the common hypothesis that *þ* or *th* was ever a true aspirate (th), and the remarks on the antiquity of the voiced pronunciation of medial and final *f* in the Northern languages. Paul's theory of the development of *þ*, &c., is, then, briefly this: *t* was changed directly into (th) the sibilant, (th) became vocal (dh), first medially, and then (in some dialects) initially. The sibilant, lastly, was converted into a stop. All this is phonetically possible, although, as Paul himself confesses, there are no instances known of (t) becoming directly (th), but it is in direct opposition to known facts. An impartial review of the pronunciation of the living, and the spelling of the dead Teutonic languages, shows clearly that the vocal pronunciation is the oldest in all the languages, and that (d) is older than (dh), except of course where, as in modern Dutch and German, the (dh) has, at a comparatively late period, changed into the voiced stop from which it arose. The only tenable hypothesis is the one advanced by me in the appendix to my edition of the Old English *Pastoral Care*, in which I have also anticipated Paul in denying that *þ* ever was a true aspirate.

Of special interest for English scholars is R. Wülcker's "Übersicht der Neuangelsächsischen Sprachdenkmäler," in which he gives a full list of all the known Semi-saxon texts, with an account of their age, linguistic character and editions. The essay is not merely a useful summary of what is already known, but also contains a good deal of original criticism.

The two remaining essays, "Legenden und Sagen von Pilatus" by W. Creizenach, and "Über die Letanie" by F. Vogt, are of no general interest for English readers.

HENRY SWEET.

*Contents of the Journals.*

**Archæologia Cambrensis**, October, 1873.—Chevalier Lloyd: History of the Lordship of Maelor Gymraeg or Bromfield (continued). [This like the previous instalments is rich in Welsh proper names.]—Ernest Hartland: Notes on a Radnorshire cross [in Llowes churchyard. The suggestion that interlaced ornaments in compartments are often to be found on stones bearing inscriptions in the Romano-British character is unwarranted.]—M. H. Bloxam: Beaumaris church. [The writer finds that the earliest Christian structure now existing in Wales is to be seen in Puffin Island.]—Henry G. Bull: The discovery of some remains of the ancient chapel in the Forest of Deerfold.—James Davies: Wapley Camp and its Connexion with the resistance of Caractacus to the Romans.—E. L. Barnwell: Unexplained Stone Articles.—John Rhys: Welsh words borrowed from Latin, Greek, and Hebrew (continued).—D. R. Thomas: Monachi di Mochrader. [The writer identifies Mochrader with Bochradiadr, near Bala.]—E. L. Barnwell: On "The Nevern Rock-Cross" [cut in the face of the rock with a corresponding hollow below, cut out to serve as a kneeling-place; it is unique in Wales and stands on the pilgrims' route from Holywell to St. David's], and on a "Grave in Wenlock Abbey" [the method of burial and the accompanying pottery are enigmatical].—Llallawg: Want of accuracy in Welsh Books.. [The writer gives instances, to which many more might easily be added.]—John Rhys: Inscribed Stones of Wales. [Refutes Brash's Irish claim to them and gives revised readings of several of them.]—Howel W. Lloyd: Gwytheriac Nunnery. [Inclines apparently to locate it at Gwytherin.]—The same: Welsh words derived from Latin. [This is a protest based on bad philology against Rhys' list.]—Celtic Remains and Original Documents continued.

*Notes and Intelligence.*

A correspondent writes:—In the *Academy*, No. 83, Nov. 1, 1873, p. 419, "The Annals of the Bamboo Books," the following remark is quoted from Mr. Holt: "Nor is it a fact of common interest to know that *to this very day* the Virgin Mary is honoured in the Basque Provinces under the name of Astarte." I cannot find this exact word in the Dictionaries of the French-Basque, but it may exist in the Spanish dialects—Ast-arte, and is probably one of the many derivatives of "arte" p. between, s. space between two things. Thus arte-ko-a, ar-arte-ko-a, "the Mediatrix," is often applied to the Virgin. Astarte in Basque would thus have nothing to do with Ishtar or Astarte, Queen of the Stars.

## WEEKLY ISSUE OF THE ACADEMY.

On January 3rd, 1874, and regularly on every Saturday morning in time for the early trains,

PRICE FOURPENCE; FREE BY POST, FOURPENCE  
HALFPENNY,

# THE ACADEMY,

CONTAINING EVERY WEEK,

REVIEWS of every important new Book, English and Foreign, in POETRY, FICTION, TRAVELS, BIOGRAPHY, NATURAL PHILOSOPHY, THEOLOGY, THE SCIENCE OF LANGUAGE, especially of the OLD ENGLISH LANGUAGE and LITERATURE.

PERIODICAL NEWS-LETTERS on Literary and Artistic Subjects, by eminent Men from the principal Capitals of Europe, and from America, as well as from the more important GEOGRAPHICAL and SCIENTIFIC EXPEDITIONS.

CORRESPONDENCE between Literary Men; Jottings of interest respecting RARE BOOKS, SALES, and CURIOSITIES; PUBLISHERS' ANNOUNCEMENTS, &c.

Regular Notices of the PICTURE EXHIBITIONS, of the STAGE, MUSIC, &c.

Published by WILLIAM GREIG SMITH,  
43, Wellington Street, Strand, W.C.

And by order of all Booksellers and Newsmen.

Now ready, demy 8vo, price 10s. 6d.

**The Orkneyinga Saga.** Edited, with Notes and Introduction, by JOSEPH ANDERSON, Keeper of the National Museum of the Antiquaries of Scotland.

Edinburgh: EDMONSTON AND DOUGLAS.

## UNIVERSITY OF LONDON.

**THE** following are the Dates at which the several EXAMINATIONS in the UNIVERSITY OF LONDON for the year 1874 will commence:—

Matriculation.—Monday January 12, and Monday June 29.

Bachelor of Arts.—First B.A., Monday July 20.

Second B.A., Monday October 26.

Master of Arts.—Branch I., Monday June 1; Branch II., Monday June 8; Branch III., Monday June 15.

Doctor of Literature.—First D.Lit., Monday June 1.

Second D.Lit., Tuesday October 13.

Scriptural Examinations.—Tuesday November 24.

Bachelor of Science.—First B.Sc., Monday July 20.

Second B.Sc., Monday October 26.

Doctor of Science.—Within the first twenty-one days of June.

Bachelor of Laws.—First LL.B. } Thursday January 8.  
Second LL.B. }

Doctor of Laws.—Thursday January 15.

Bachelor of Medicine.—Preliminary Scientific, Monday July 20.

First M.B., Monday July 27.

Second M.B., Monday November 2.

Bachelor of Surgery.—Tuesday November 24.

Master in Surgery.—Monday November 23.

Doctor of Medicine.—Monday November 23.

Examination for Women.—Monday May 4.

The Regulations relating to the above Examinations and Degrees may be obtained on application to "The Registrar of the University of London, Burlington Gardens, London, W."

WILLIAM B. CARPENTER, M.D.,  
Registrar.

December 10, 1873.
